1 Introduction

The purpose of this document is to provide an overview of the process for calculating expected length of stay (ELOS) and Health Based Allocation Model (HBAM) Inpatient Grouping weights for use with the HBAM Inpatient Grouping (HIG) methodology for the 2012 Discharge Abstract Database (DAD). The HIG methodology applies to Ontario inpatient data only.

HBAM is the new funding methodology of the Ontario Ministry of Health and Long-Term Care (MOHLTC) under the Health System Funding Strategy. CIHI's support of HBAM includes the development, maintenance and evolution of the HIG methodology.

While CIHI supports the inpatient grouping methodology, the Ontario MOHLTC maintains the HIG weighting components, including ELOS values, HIG weights, and short- and long-stay trim point values. As well, the MOHLTC defines the methodology and factors that adjust the ELOS and weight. The weight and ELOS tables for HIG 2012 are provided in appendices A to F.

2 Overview of HIG Assignment

The HIG methodology uses Case Mix Group (CMG+) grouping methodology output and additional clinical information to assign each case to an HIG. In fact, the assigned HIG group is the same as the assigned CMG+ group in more than 88% of Ontario inpatients for 2010–2011. It is therefore important to understand the assignment of CMG+ groups. For a complete introduction to CMG+ assignment, please consult the CMG+ 2012 Directory.

High-Level Business Rules

In most cases, the HIG groups are identical to the CMG+ groups. As mentioned above, 88% of cases are assigned to HIG groups that are the same as the CMG+ group. The remaining 12% are assigned to 44 HIG groups that are created after applying one of the following four split types to 21 CMG+ groups:

1. **Diagnosis—**For example, CMG+ group 139 Chronic Obstructive Pulmonary Disease has been split into two HIG groups, 139a Chronic Bronchitis and 139b Chronic Obstructive Pulmonary Disease.
2. **Presence/absence of comorbid cardiac conditions** among cardiac CMG+ groups—All diagnoses on the DAD abstract (diagnosis types 1, 2, W, X and Y) are examined for specific comorbid cardiac conditions, such as congestive heart failure.
3. **Presence of comorbidities** in obstetric cases using the CMG+ grouper output comorbidity level (CL)—Cases with CL 0 are grouped separately from cases with CL 1–4.
4. **One intervention-driven group—**The Bone Marrow/Stem Cell Transplant CMG+ group has been enhanced so that all records indicating bone marrow and stem cell transplants are grouped together.

The diagnosis codes and diagnosis types used to assign comorbid status in cardiac splits are found in Appendix G. For CCI codes used to group bone marrow/stem cell transplants and for comorbidity diagnosis codes used in obstetrics, see the CMG+ 2012 Directory.

For CMG+ groups that are not further split by the modifications described above, the HIG group assigned is the same as the CMG+ group. The following tables present the CMG+ groups that are further refined into unique HIG groups.

New for 2012

A number of updates were made to HIG 2012. This section provides an overview of these modifications.

MCC 13 Pregnancy and Childbirth

Major changes were made in the grouping of delivery cases in CMG+ 2012. These changes were incorporated into HIG 2012. For more information, please see the CMG+ 2012 Directory.

HIG Cells Incorporated Into CMG+

Several HIG cells have become separate cells in CMG+ 2012. Since CMG+ is the foundation for HIG, these cells now have new HIG group numbers; please see Table 5.

Table 5: 2012 HIG Group Numbers

HIG Description	2011 HIG Group	2012 HIG Group
Endocarditis	199a	199
Cardiac Value Disease, Except Endocarditis	199b	214
Osteoarthritis	362a	362
Inflammatory and Reactive Arthropathy	362b	370
Malignant Neoplasm of Thyroid/Parathyroid	440a	440
Disease/Disorder of Thyroid/Parathyroid	440b	441
Malignant Neoplasm of Ovary	520a	520
Malignant Neoplasm of Female Reproductive System Except Ovary	520b	525

New SCU Codes

Three SCU codes have been added to the SCU list that activates the SCU Flag. These codes are 51, 52 and 53 (Neonatal Intensive Care Units).

Flagged Intervention

Minor title enhancements have been made to the long and short mechanical ventilation categories. The category titles are now Invasive Ventilation (Long) ≥96 and Invasive Ventilation (Short) <96, respectively.

ICD-10-CA and CCI Code Changes

Many new ICD-10-CA and CCI codes were added to the classification for 2012.

All new codes used in the CMG grouping methodology have been incorporated. A complete listing of new ICD-10-CA codes appears in Appendix A: New ICD-10-CA Codes for 2012 in the *International Statistical Classification of Diseases and Related Health Problems, Tenth Revision, Canada, 2012*. The complete listing of new CCI codes can be found in Appendix E: New CCI Codes for 2012 in the *Canadian Classification of Health Interventions, 2012*.

3 Factors Used in HIG Methodology

There is often significant variation in resource consumption and length of stay among patients within a HIG. To account for this variation, the HIG methodology identifies seven factors to be used to adjust resource indicators: age, flagged intervention (FI), intervention event (IE), out-of-hospital (OOH) intervention, special care unit (SCU), discharged to home care, and maternal age ≥40.

These factors are used in the calculation of the weight and ELOS for each discharge; it is important to note that these factors are not used for HIG assignment.

Age Category

In the DAD, the patient age variable captures the patient's age at the time of admission. The HIG methodology contains the following age categories:

Newborns and Neonates:

F 0 to 364 Days (Newborn/Neonate/Pediatric)

Pediatric:

H 1 to 17 Years (Pediatric)

Adult:

R 18 to 59 Years (Adult)
S 60 to 79 Years (Adult)
T 80+ Years (Adult)

The age factor is combined with the HIG to assign a base weight and ELOS value. These base values represent the ELOS and weight of the HIG/age category when no other factors are present.

Flagged Interventions

In HIG, 14 categories of interventions are identified as FIs. These FIs are used to identify patients whose cases are more complex and resource-intensive than those of patients who have not required these interventions. While the actual interventions may not be expensive, the associated costs and LOS are higher for patients who require these interventions than for patients in the same HIG who do not.

The 14 categories of flagged interventions are presented in Table 6. See the CMG+ 2012 Directory for intervention codes included in each category.

Table 6: Flagged Intervention Codes

Flagged Intervention Category Code	Flagged Intervention Category
A	Cardioversion
B	Cell Saver
C	Chemotherapy
D	Dialysis
E	Feeding Tube
F	Heart Resuscitation
G	Invasive Ventilation (Long) >= 96 hours
H	Invasive Ventilation (Short) < 96 hours
I	Paracentesis
J	Parenteral Nutrition
K	Pleurocentesis
L	Radiotherapy
M	Tracheostomy
N	Vascular Access Devices

Intervention Event Factor

The IE factor is designed to capture the effect of multiple intervention events and further enhance the prediction of patient resource consumption. An intervention event is defined as a trip made to the operating or surgical room, regardless of the number of interventions performed, as long as at least one intervention was significant—that is, an intervention was on the intervention partition list. When a patient requires multiple intervention events, it is suggestive of complicated treatments and higher resource consumption. Each case is assigned to one of four intervention event codes. By definition, if a case is assigned to a HIG in the intervention partition, it must have at least one IE.

For cases with two or more IEs, IE factors are used to adjust the ELOS and weight estimates for two IEs and for three or more IEs. Table 7 provides the IE codes and their descriptions.

Table 7: Intervention Event Codes

Code	Description
1	1 Intervention Event
2	2 Intervention Events
3	3 or More Intervention Events
8	0 Intervention Events

Discharged to Home Care

The HIG methodology also includes an adjustment for patients discharged to home care. DAD-coded referral to home care is a marker of measured severity and complexity and is generally associated with increased resource use. The Discharged to Home Care Flag is defined using both the discharge disposition and transfer to institution codes.

Specifically, the home care flag is set to 1 if

Discharge Disposition = 04 (Discharged to Home or a Home Setting With Support Services) AND Transfer To = Home Care or Blank

OR

Discharge Disposition = 05 (Discharged Home [patient functions independently with no support service from an external agency required]) AND Transfer To = Home Care

Maternal Age

The maternal age factor is flagged in obstetric cases in which the mother’s age is greater than or equal to 40. This takes into account the increased complexity of births involving mothers of advanced age.

Special Care Unit Factor

The special care unit (SCU) factor is intended to account for the difference in cost for patients who were treated in special care units. Special care unit codes on the abstract are examined and presence/absence of codes set the SCU flag to 1 or 0. Table 8 lists the codes that are currently used to set the SCU flag to 1.

Table 8: Special Care Unit Codes

SCU Code	Description
10	Medical Intensive Care Nursing Unit
20	Surgical Intensive Care Nursing Unit
25	Trauma Intensive Care Nursing Unit
30	Medical/Surgical Intensive Care Nursing Unit

Out-of-Hospital Intervention Factor

The OOH intervention factor applies to only a handful of HIGs. It identifies cases that had an intervention performed in a hospital other than the admitting facility. This factor is applied to the following three groups of interventions: pacemaker implant, coronary angiography and percutaneous coronary intervention (PCI). Analysis of patient data illustrated that having these interventions performed on an OOH basis is routine for some institutions and results in significantly lower costs to the institution where the patient is admitted as an inpatient. While these interventions are often performed in a different facility, the patient's condition and need for treatment justifies grouping these cases with those cases that had the intervention performed in the admitting facility. This factor was created to account for the resources consumed outside of the admitting hospital.

4 Atypical Code Assignment

In HIG, the atypical status of a case is defined based on the total length of stay, palliative care status, transfer to/from code and discharge disposition of the patient and the CMG+ atypical code. The atypical code affects how the weight values are assigned to the case.

Table 9 lists the atypical codes for different types of cases as well as the percentages of cases in each atypical category in 2010 inpatient DAD data from Ontario.

Table 9: HIG Atypical Distribution

Atypical Category	Atypical Status	HIG Atypical Code	Count	Percentage

Identifying Short Stay Cases

Short stay cases with atypical code 09 are cases with all of the following:

1. TLOS ≤ short stay trim points
2. CMG atypical code = 00
3. No vascular access device, invasive ventilation or SCU codes were recorded on the abstract and the patient did not die

As we will see later on, these cases have HIG weights assigned using a per diem method. The short stay trim point is not factor-adjusted and is HIG-specific.

Identifying Long Stay Cases

Long stay cases with atypical codes 10 through 17 are determined by comparing total length of stay (TLOS) with long stay trim days. Long stay trim days is calculated by adding a long stay addition to the adjusted ELOS for a case.

Thus, a case is considered long stay if

TLOS ≥ ELOS + Long Stay Addition

It is important to note that the long stay addition is not adjusted for any factors and is HIG-specific.

Identifying Atypical Death Cases

In HIG methodology, only palliative care deaths are atypical (atypical codes 04, 07, 14 and 17). A death is considered palliative if diagnosis code Z515 (Palliative Care) is anywhere on the abstract. If a patient dies and this code is not on the abstract, it is considered a typical case (atypical code = 00) and is weighted as such.

5 Typical Weight Methodology

Overview

To assign ELOS and HIG weight values to a case, it is first necessary to determine the atypical category of the case (that is, whether the case is typical, short stay, atypical or long stay). The atypical status of a case is based on the total length of stay, palliative care status, transfer to/from code and discharge disposition of the patient and the CMG+ atypical code, as previously noted.

Cases involving patients who have been transferred into and/or out of an acute care facility, had palliative care deaths or were signed out are considered atypical. Furthermore, every case will have a long stay trim day value assigned based on its HIG, age and presence or absence of factors.

The long stay trim point is used to identify records that have an unusually long length of stay. Records that have a total length of stay greater than or equal to the long stay trim days are classified as long-stay records. Similarly, short stay trim points identify records that have an unusually short length of stay and again will be classified as such.

The patient population can be divided into seven types:

- **Typical**—No transfer, not a palliative death, not a sign out and length of stay between short stay and long stay trim point
- **Atypical**—Transfer, palliative death or sign out
- **Short stay**—Length of stay less than or equal to short stay trim. CMG atypical code 00, no invasive ventilation, vascular access device or special care unit
- **Long stay**—Total length of stay greater than or equal to the trim point
- **Long stay atypical**—Total length of stay greater than or equal to the trim point and transfer, death or sign out
- **Atypical codes 97, 98 and 99** (Invalid LOS, Not Applicable, RIW Not Assigned)
- **HIG>989** (Cadaveric Donor, Stillbirth, Diagnosis Not Generally Hospitalized, Ungroupable)

As the next few sections will demonstrate, each type of case has its own approach for HIG weight assignment.

5.1 Examples: Typical Non-Factor Cases

Scenario 5.1.1

Consider a case in HIG 139a Chronic Bronchitis in age category R (18 to 59 years) with no flagged interventions, SCU flags or other factors. The total length of stay is four days.

For cases such as these, the final ELOS and HIG weight are equal to base ELOS and HIG weight and can be found in the base tables of Appendix A. The short stay trim point is also found in the base table of Appendix A.

It is important to note that while age effects are contained in a separate table (Appendix B), they are considered part of the base weight. Base values are assigned for each HIG–age group combination and are calculated by adding the age adjustment to the base HIG weight/ELOS.

The factor effects in HIG are additive. This means that the values in the base tables are added to the values in the factor effects tables to get the long stay trim point, ELOS and weight for cases.

For HIG 139a

Short Stay Trim Days = 1.0

TLOS > Short Stay Trim Days, so this is not a short stay case.

Base ELOS = 4.6484
ELOS $\text{Adjustment}_{\text{Age R}}$ = 0.0000
Final ELOS = 4.6484 + 0.0000 = 4.6484
Long Stay Addition = 12.7260
Long Stay Trim Days = 12.7260 + 4.6484 = 17.3744

TLOS < Long Stay Trim Days, so this is a typical length case and we can calculate the HIG weight as follows:

HIG Weight = 0.8066
Weight $\text{Adjustment}_{\text{Age R}}$ = 0.0000
Final HIG Weight = 0.8066 + 0.0000 = 0.8066

Scenario 5.1.2

Consider a case similar to the one in scenario 5.1.1 but in age category S (60 to 79 years). From the base tables, ELOS and weight are found. Assume we have already determined that this is not a short stay case.

Base ELOS = 4.6484
ELOS $\text{Adjustment}_{\text{Age S}}$ = 0.5492
Final ELOS = 4.6484 + 0.5492 = 5.1976
Long Stay Addition = 12.7260
Long Stay Trim Days = 12.7260 + 5.1976 = 17.9236

TLOS < Long Stay Trim Days, so this is a typical length case and we can calculate the HIG weight as follows:

Base HIG Weight = 0.8066
Weight $\text{Adjustment}_{\text{Age S}}$ = 0.0000
Final HIG Weight = 0.8066 + 0.0000 = 0.8066

5.2 Examples: Typical Single-Factor Cases

The following scenarios demonstrate the use of factors to adjust the ELOS, weights and long stay trim estimates. Note that not all factors are found in base tables; some factors have their own lookup table.

Scenario 5.2.1

Consider a case in HIG 139a Chronic Bronchitis in age category R (18 to 59 years) with a TLOS of four days, a SCU flag of 1 and no other factors. Assume we have already determined that this is not a short stay case.

For HIG 139a

Base ELOS = 4.6484
ELOS $\text{Adjustment}_{\text{Age R}}$ = 0.0000
Long Stay Addition = 12.7260

The SCU factor can be found in Appendix A on the same row as the base values for the HIG.

ELOS $\text{Effect}_{\text{SCU}}$ = 2.03210
Final ELOS = 4.6484 + 0.0000 + 2.03210 = 6.6805
Long Stay Trim Days = 12.7260 + 6.6805 = 19.4065

TLOS < Long Stay Trim Days, so this is a typical length case and we can calculate the HIG weight as follows:

Base HIG Weight = 0.8066
Weight $\text{Adjustment}_{\text{Age R}}$ = 0.0000
Weight $\text{Factor}_{\text{SCU}}$ = 1.4861
Final HIG Weight = 0.8066 + 0.0000 + 1.4861 = 2.2927

Scenario 5.2.2

Consider a case from the same HIG and the same factors as the case in scenario 5.2.1 but from age category S (60 to 79 years) and with a four-day total length of stay. The base values are the same as in scenario 5.1.2.

Base ELOS = 4.6484
ELOS $\text{Adjustment}_{\text{Age S}}$ = 0.5492
Long Stay Addition = 12.7260

In the same table, we can find the SCU effects for this HIG:

ELOS $\text{Effect}_{\text{SCU}}$ = 2.03210
Final ELOS = 4.6484 + 0.5492 + 2.03210 = 7.2297
Long Stay Trim Days = 12.7260 + 7.2297 = 19.9557

Note that the SCU effects do not differ by age. Adding the SCU effects from the table with the base values gives the final ELOS, long stay trim days and weight.

TLOS < Long Stay Trim Days, so this is a typical length case and we can calculate the HIG weight as follows:

Base HIG Weight = 0.8066
Weight $\text{Adjustment}_{\text{Age S}}$ = 0.0000
Weight $\text{Factor}_{\text{SCU}}$ = 1.4861
Final HIG Weight = 0.8066 + 0.0000 + 1.4861 = 2.2927

Scenario 5.2.3

Consider a case from HIG 139a, age category R (18 to 59 years) with flagged intervention G (Invasive Ventilation ≥ 96 hours), no other factors and total length of stay of four days.

The base values can be found in Appendix A and are the same as in scenario 5.1.1.
The effects of flagged interventions can be found in the flagged intervention factor table in Appendix C. Note that rows with all factor effects equal to zero were removed from the table to conserve space. Searching first by HIG and then by flagged intervention category gives the factor effect values. For HIG 139a, the FI effects for Invasive Ventilation ≥ 96 hrs are as follows:

Table 10: Values for Scenario 5.2.3

Indicator	Base (139a)	Age Adjustment (R)	Factors	
			Effect	Value
ELOS	4.6484	0.0000	FI IV≥96hrs	7.1291
Long Stay Addition	12.7260	-	-	-
HIG Weight	0.8066	0.0000	FI IV≥96hrs	2.4903

Adding the FI effect from the flagged interventions factor table with the base values gives the final ELOS and long stay trim days:

Final ELOS = 4.6484 + 0.0000 + 7.1291 = 11.7775
Long Stay Trim Days = 12.7260 + 11.7775 = 24.5035

TLOS < Long Stay Trim Days, so this is a typical length case and we can calculate the HIG weight as follows:

Final HIG Weight = 0.8066 + 0.0000 + 2.4903 = 3.2969

Scenario 5.2.4

The case examined here is from HIG 139a, age category S (60 to 79 years), with total length of stay of four days, a home care flag of 1 and no other factors. This example examines the use of the home care factor.

The base values are the same as for scenario 5.2.2. The home care factor can be found in Appendix A on the same row as the base values for the HIG.

These are summarized in Table 11.

Table 11: Values for Scenario 5.2.4

Indicator	Base (139a)	Age Adjustment (S)	Factors	
			Effect	Value
ELOS	4.6484	0.5492	Homecare	1.5956
Long Stay Addition	12.7260	-	-	-
HIG Weight	0.8066	0.0000	Homecare	0.1968

Final ELOS = 4.6484 + 0.5492 + 1.5956 = 6.7932
Long Stay Trim Days = 12.7260 + 6.7932 = 19.5192

TLOS < Long Stay Trim Days, so this is a typical length case and we can calculate the HIG weight as follows:

Final HIG weight = 0.8066 + 0.0000 + 0.1968 = 1.0034

Scenario 5.2.5

Consider a case in HIG 161—Implantation of Cardioverter/Defibrillator, age category R (18 to 59 years), with a total length of stay of four days, three intervention events and no other factors. This example is meant to show the use of the IE factor table.

The IE factor effects can be found in the intervention events factor table in Appendix D. Only cases in the intervention-driven HIG groups are eligible for an IE effect, which is the reason that not all HIGs are present in the intervention events factor table. Cases with multiple intervention events are categorized into two groups with regard to the IE factor: two intervention events and three or more intervention events. In the IE factor table, searching by HIG number then by number of interventions gives the IE effects for HIG 161.

Table 12: Values for Scenario 5.2.5

Indicator	Base (161)	Age Adjustment (S)	Factors	
			Effect	Value
ELOS	3.1228	0.0000	Intervention Events (3)	11.2135
Long Stay Addition	19.9539	-	-	-
HIG Weight	4.5875	0.0000	Intervention Events (3)	2.0661

Summing the base and factors for ELOS gives

Final ELOS = 3.1228 + 0.0000 + 11.2135 = 14.3363
Long Stay Trim Days = 19.9539 + 14.3363 = 34.2902

TLOS < Long Stay Trim Days, so this is a typical length case and we can calculate the HIG weight as follows:

Final HIG Weight = 4.5875 + 0.0000 + 2.0661 = 6.6536

Scenario 5.2.6

The case in the next scenario deals with the OOH intervention factor.

This case is similar to the case in scenario 5.2.5, but it differs in that the cardioverter/defibrillator implantation was performed out of hospital and the total length of stay is four days. The OOH factor table in Appendix E lists the effect of the OOH intervention factor on various HIGs. Note that the OOH intervention factor affects both the ELOS and weight. For HIG 161, the required values are shown in Table 13

Table 13: Values for Scenario 5.2.6

Indicator	Base (161)	Age Adjustment (S)	Factors	
			Effect	Value
ELOS	3.1228	0.00000	OOH	4.7198
Long Stay Addition	19.9539	-	-	-
HIG Weight	4.5875	0.0000	OOH	-3.3465

Summing the base and factors for ELOS gives

Final ELOS = 3.1228 + 0.0000 + 4.7198 = 7.8426
Long Stay Trim Days = 19.9539 + 7.8426 = 27.7965

TLOS < Long Stay Trim Days, so this is a typical length case and we can calculate the HIG weight as follows:

Final HIG Weight = 4.5875 + 0.0000 + -3.3465 = 1.2410

5.3 Examples: Typical Multiple-Factor Cases

Next we will look at a scenario with multiple factors. When there is more than one factor, each of the factors is added to the base values.

Scenario 5.3.1

Consider a case from HIG 139a age category S (60 to 79 years) with SCU flag of 1, and flagged intervention G (Invasive Ventilation ≥ 96 hours). This case has a total length of stay of four days. Base values are the same as for scenario 5.2.1 and flagged interventions and SCU factors can be looked up as previously discussed.

Table 14: Values for Scenario 5.3.1

Indicator	Base (139a)	Age Adjustment (S)	Factors			
			Effect	Value	Effect	Value
ELOS	4.6484	0.5492	SCU	2.03210	FI IV≥96hrs	7.1291
Long Stay Addition	12.7260	-	-	-	-	-
HIG Weight	0.8066	0.0000	SCU	1.4861	FI IV≥96hrs	2.4903

The final values are found by adding all factor effects to base values as follows:

Final ELOS = 4.6484 + 0.5492 + 2.03210 + 7.1291 = 14.3588
Long Stay Trim Days = 12.7260 + 14.3588 = 27.0848

TLOS < Long Stay Trim Days, so this is a typical length case and we can calculate the HIG weight as follows:

Final HIG Weight = 0.8066 + 0.000 + 1.4861 + 2.4903 = 4.7830

5.4 Examples: Short Stay Cases

Short stay cases (atypical code 09) are those cases in which TLOS is less than or equal to the short stay trim days, CMG+ atypical code is 00 and the patient did not have invasive ventilation, vascular access device or special care unit codes in the abstract. These cases are assigned a weight on a per diem basis and are not adjusted for factors.

Weights for these cases are calculated by multiplying a per diem value by TLOS and then adding it to the short stay base weight. The next example will examine this methodology.

Scenario 5.4.1

In this scenario, we have a patient in HIG 139a with TLOS 1, no factors and age category R.

We look up the base values in Appendix A and find the following:

HIG 139a

Short Stay Trim Days = 1.000

As the total length of stay is equal to the short stay trim point, this is a short stay case.

The weight of a short stay case is calculated using a per diem basis and is not adjusted for any factors.

$$\text{HIG Weight}_{\text{Short Stay}} = \text{HIG Short Stay}_{\text{Base}} + (\text{HIG Short Stay per Diem} \times \text{TLOS})$$

Going back to the tables in Appendix A, we look up short stay base and short stay per diem for HIG 139a:

Short Stay Base = 0.1645
Short Stay PD = 0.0868

And the final HIG weight for this example is

$$\text{Final HIG Weight}_{\text{Short Stay}} = 0.1645 + (0.0868) \times 1 = 0.2513$$

5.5 Examples: Atypical Cases

Atypical cases include those that are acute care transfers (in, out, or in and out), sign outs, and palliative death cases with TLOS less than the long stay trim days. Due to the mode of admission/discharge, these cases do not follow the typical course of treatment. Instead of being assigned a typical HIG weight, these atypical cases utilize a per diem–based approach in assigning HIG weight.

The per diems are adjusted according to the length of stay group. Table 15 lists the length of stay groups and corresponding per diem.

Table 15: Per Diem by Total Length of Stay

Total Length of Stay	Per Diem
TLOS ≤ HIG LOS 10th percentile	HIG PD = HIG $\text{PerDiem}_{\text{Base}}$ + HIG $\text{PerDiem}_{\text{Factors}}$ + HIG PerDiem10
HIG LOS 10th percentile < TLOS ≤HIG LOS 25th percentile	HIG PD = HIG $\text{PerDiem}_{\text{Base}}$ + HIG $\text{PerDiem}_{\text{Factors}}$ + HIG PerDiem25
TLOS > HIG LOS 25th percentile	HIG PD = HIG $\text{PerDiem}_{\text{Base}}$ + HIG $\text{PerDiem}_{\text{Factors}}$ + HIG Atypical Factor

The per diem adjustments are found in the atypical factors table in Appendix F.

Scenario 5.5.1

In this scenario, the patient was transferred to an acute care hospital from another acute care institution, resulting in the patient being defined as atypical type 01 (Transfer In). Again, this example is from HIG 139a, age category R, no factors present and TLOS of five days.

We look up the necessary base values for HIG 139a from appendices A and B, respectively:

Base PD = 0.1497
PD $\text{Adjustment}_{\text{Age R}}$ = 0.0000

Next we look up the per diem adjustment from the atypical percentile tables. In Appendix F, we find HIG cell 139a with atypical code = 01.

Table 16: Values for Scenario 5.5.1

HIG Cell	HIG Atyp Code	HIG LOS Percentile 10	HIG LOS Percentile 10 PD	HIG LOS Percentile 25	HIG LOS Percentile 25 PD	HIG LOS Percentile 75	HIG LOS Percentile 75 OPD	HIG LOS Percentile 90	HIG LOS Percentile 90 OPD	HIG LOS Percentile 95	HIG LOS Percentile 95 OPD	HIG Atyp Factor
139a	01	1	0.0965	3	0.0458							0.0000

Table 15 presents the length of stay values at the 10th and 25th percentiles, as well as their corresponding adjustment factors.

We look up TLOS to see whether it is less than or equal to the 10th percentile, greater than the 10th and less than or equal to the 25th, or greater than the 25th percentile.

Examining Table 15, we see that for HIG 139a with atypical code 01, if TLOS is less than or equal to 1, we adjust using the 10th percentile; if TLOS is less than or equal to 3 and greater than 1, we adjust using the 25th percentile; and if TLOS is greater than 3, we adjust using the HIG atypical factor. In this case, we have a TLOS of five days and thus adjust using the HIG atypical factor.

PD $\text{Adjustment}_{\text{Atyp}}$ = 0.0000

Final Weight = (Base Per Diem + PD $\text{Adjustment}_{\text{Age R}}$ + PD $\text{Adjustment}_{\text{Atyp}}$) × TLOS

Final Weight = (0.1497 + 0.0000 + 0.0000) × 5 = 0.7485

Scenario 5.5.2

In this scenario, we have a patient similar to the patient in scenario 5.5.1; however, this patient was a palliative care death (atypical code 04) and has one flagged intervention (G) and TLOS of two days.

We look up the necessary base values for HIG 139a from appendices A, B and C, respectively:

Base PD = 0.14970
PD $\text{Adjustment}_{\text{Age R}}$ = 0.00000
PD $\text{Effect}_{\text{FI}}$ = 0.0954

Next, we consult the atypical percentile table to find our adjustment. Here, a TLOS of two days falls between the 10th and 25th percentile, so we adjust for below the 25th percentile.

PD Adjustment_{25} = 0.0789

Final Weight = (Base PD + PD $\text{Adjustment}_{\text{Age R}}$ + PD $\text{Effect}_{\text{FI}}$ + PD Adjustment_{25}) × TLOS

Final HIG Weight $_{\text{Atypical}}$ = (0.1497 + 0.0954 + 0.0789) × 2 = 0.6480

5.6 Examples: Long Stay Cases

All cases previously presented have a total length of stay less than the long stay trim days. If, on comparing the total length of stay and final long stay trim days, the total length of stay for the case is greater than or equal to the long stay trim days, then we would calculate the HIG weight using the long stay methodology.

Scenario 5.6.1

Let's consider the case in scenario 5.1.1. In that scenario, the total length of stay is 121 days.

For HIG 139a age category R, we formerly calculated

Final ELOS = 4.6484 + 0.0000 = 4.6484
Long Stay Addition = 12.7260
Long Stay Trim Days = 12.7260 + 4.6484 = 17.3744

In this case, the TLOS is greater than the long stay trim days of 17.3744. The case is therefore defined as long stay (atypical code = 10).

HIG weights for long stay cases are calculated as the sum of the typical case weight and a per diem weight that accounts for the extended length of stay of the case. We calculated the typical portion in scenario 5.1.1 as follows:

Typical HIG weight = 0.8066

The second part of the weight is calculated using the number of days beyond ELOS and a long stay per diem. This long stay PD is adjusted for factors and, similar to atypical cases, is adjusted based on the length of stay group.

Looking up the necessary base values for HIG 139a,

Base Outlier PD = -0.0187
PD Outlier $\text{Adjustment}_{\text{Age R}}$ = 0.0000

Next, we consult the atypical percentile table for HIG cell 139a atypical code = 10. In this case, a TLOS of 121 days falls beyond the 95th percentile, so we adjust for being above the 95th percentile:

PD Adjustment_{95} = 0.0744

Long Stay PD = Base Outlier PD + PD Outlier $\text{Adjustment}_{\text{Age R}}$ + PD Adjustment_{95}

Long Stay Per Diem = -0.0187 + 0.0000 + 0.0744 = 0.05570

HIG Weight = Typical HIG weight + Long Stay Per Diem × (TLOS-ELOS)

Final HIG $\text{Weight}_{\text{Long Stay}}$ = 0.8066 + 0.0557× (121 - 4.6) = 7.2901

Scenario 5.6.2

Suppose we have the same case as in scenario 5.6.1, but instead of being discharged from hospital, the patient was transferred to another acute facility. Since the HIG and factors remain the same from scenario 5.6.1, the long stay trim days of 17.3744 still applies to this case and it is still a long stay case. However, since the patient was transferred out, this becomes a long stay atypical case with HIG atypical code = 12.

The HIG weight for atypical long stay cases is calculated as the sum of the typical case weight and a per diem weight that accounts for the extended length of stay of the case.

As with scenario 5.6.1,

Typical HIG weight = 0.8066
Base Outlier PD = -0.0187
PD Outlier $\text{Adjustment}_{\text{Age R}}$ = 0.0000

Next, we consult the atypical percentile table for HIG cell 139a atypical code = 12. In this case, a TLOS of 121 days falls beyond the 95th percentile, so we adjust for being above the 95th percentile:

PD Adjustment_{95} = 0.0744

Long Stay PD = Base Outlier PD + PD Outlier $\text{Adjustment}_{\text{Age R}}$ + PD Adjustment_{95}

Long Stay Per Diem = -0.0187 + 0.0000 + 0.0744 = 0.05570

HIG Weight = Typical HIG Weight + Long Stay Per Diem × (TLOS-ELOS)

Final HIG $\text{Weight}_{\text{Long Stay Atypical}}$ = 0.8066 + 0.0557 × (121 - 4.6) = 7.2901

In this case, the PD adjustment for both 5.6.1 and 5.6.2 is the same. This is not true in all cases, however.

5.7 Atypical Type 08 (HIG>989)

Cases in HIG groups numbered >989 are a collection of cases that included cadaver donors, stillbirths, patients with a diagnosis not generally hospitalized, as well as ungroupable data. These cases are assigned a weight on a per diem basis to a maximum of four days. These are not adjusted for any factors.

Scenario 5.7.1

Consider a case in HIG 993 Diagnosis Not Generally Hospitalized, with a TLOS of seven days. We look up our per diem values in Appendix A.

For HIG 993

HIG Base PD = 0.1489

HIG Weight = HIG PD × MINIMUM (TLOS, 4)

As the TLOS of seven days is greater than the four-day maximum, we will use four days as the TLOS.

HIG Weight = 0.1489 × 4 = 0.5956

5.8 Atypical Types 97, 98, 99 (Invalid LOS, Not Applicable, RIW Not Assigned)

Cases with atypical codes 97, 98 or 99 are assigned a weight of zero.

Table 17 summarizes all the cases in the example scenarios. It gives a description of all cases, including their atypical status, HIG, age category and factors. It also lists their final indicator values and the tables used to derive ELOS and weight.

Frequently Asked Questions

1. **What is the difference between the HIG ELOS/weight values and CMG ELOS/RIW values?**

   Ontario-specific weight values (HIG) are calculated by the Ontario MOHLTC using only Ontario cost data. CMG+ RIWs are derived within CIHI from case-cost data collected from Ontario, Alberta and British Columbia. In addition, HIG is additive, uses different factors and has different trim points.

2. **Why is my HIG weight higher/lower than my CMG+ RIW?**

   It is difficult to compare CMG+ RIWs to HIG weights as they are derived using different cost data and have different factor adjustments. Thus, for an individual case, sometimes the CMG RIW may be higher and sometimes the HIG weight may be higher.

3. **Where can I find more information on the HIG methodology?**

   For a more in-depth understanding of HIG, there is an Introduction to HIG Methodology self-study and workshop available on CIHI's Learning Centre (https://learning.cihi.ca).

4. **Will vendors be providing products to group data to HIG?**

   Specifications for HIG 2012 were provided to vendors in December 2011.

5. **Where can I find my HIG reports?**

   Record-level reports can be found on CIHI's website in the Client Services section under eHSR. Starting July 2012 comparative reports will be available in eReporting.

6. **Will Ontario facilities continue to receive data grouped to CMG+?**

   Yes, Ontario facilities submitting acute inpatient data to DAD will receive two files: one with data grouped to HIG 2012 and one with data grouped to CMG+ 2012.

7. **Are the HIG reports cumulative throughout the year?**

   Yes, the record-level and comparative HIG reports are cumulative. For 2012, all files will contain all data submitted since April 1, 2012.

8. **Who should I contact if I have questions?**

   If you have questions about HIG grouping and weighting or questions about the reporting of HIG information, please contact CIHI via eQuery (Case Mix) or send an email to casemix@cihi.ca. If you have questions about the HBAM methodology, contact the Ontario MOHLTC by email at HBAM@Ontario.ca.
