The composition of business establishments in smaller and larger communities in Canada

Robert Mendelson, Statistics Canada

Between 1993 and 1996 there was a large number of business establishment starts in smaller and larger communities in Canada, indicating significant business establishment development in the post recessionary period of the 1990s. Between 1993 and 1996 smaller communities had a larger ratio of smaller establishments (under 10 employees) to population than larger communities. In today's economy, new establishments tend to have fewer employees (under 10 employees) and are located in the service and construction sectors of the economy.

Introduction

The structure of rural and small town business enterprise and employment in Canada is being shaped by two important trends. The first trend involves the changing structure of rural areas and small urban communities in Canada and the second trend involves the changing nature of the markets for business establishments setting up in these areas.

In a study undertaken by Bollman, Fuller and Ehrensaft (1992), the authors concluded that the rural population in Canada is becoming more *sub-suburbanized*. According to the study, 32 percent of the rural population in 1991 lived within the fringes of Census Metropolitan Areas (CMAs), centres of 100,000 people or more and Census Agglomerations(CAs), centres of 10,000 to 99,999 people and most of the growth took place within the fringes of these metropolitan centres. Similarly, in a study undertaken by Mendelson and Bollman (1997), the authors showed that growth in rural and small town Canada has taken place in small towns. Their study showed that while the share of the rural population within CMAs and CAs remained at 32 percent in 1996, most of the non-metropolitan growth took place in small towns (with a population of 1,000 to 9,999 persons).

At the same time, advancing technology, resulting in the substitution of capital for labour and the increasing size of farms has resulted in a decrease of farm employment in rural and small town Canada. While agriculture remains a vital part of the economy in many of these areas, more and more farmers are increasingly looking to off-farm employment to supplement their incomes (Fuller and Bollman). The changing structure of smaller communities in Canada has the potential to change the type of business establishments that locate in smaller communities as well as the jobs that these establishments provide. Similarly, the type of business establishments that locate in smaller communities have the potential to continue to change the structure of these communities. Increasingly, *sub-suburbanized* rural and small town communities are more likely to attract business establishments that serve a new *sub-suburbanized* population as well as populations in nearby urban centres. These establishments tend to be in the service sectors, the construction sector, and to a smaller extent, in the manufacturing sector of the economy.

For a number of reasons, establishments that start up in smaller municipalities, tend to be small (under 10 employees). These hypothesized reasons include: the decline in manufacturing industries; the competitive nature of smaller establishments; the intrasectoral restructuring of manufacturing industries favouring industries characterized by small-scale production; and long-term sectoral shifts favouring sectors characterized by low average establishment size (e.g., service industries) and the hypothesis that increasing competition leads to faster turnover and shorter duration of establishments, increasing the share of young establishments in the economy that tend to be small (1) (Olaf Foss).

While it is not the intent of this working paper to prove or disprove these hypotheses directly, the working paper will look at the formation and structure of business establishments in smaller communities in Canada, using the 1996 year-end edition of the Business Register (BR) as the database to analyze the potential impact of establishment formation and structure on employment opportunities in Canada.

Methodology

The Business Register File

For the purpose of this working paper, the number of businesses is calculated using Statistics Canada's Business Register (BR) File. The data included in the BR is derived from Revenue Canada's "Remitting Payroll Deduction Accounts" and covers all businesses with one or more employees. (Thus, any self-employed person, with no employees, i.e., any farmer or consultant who works only on his/her own account, is not included.)

The number of businesses in this working paper is not based on the number of companies, but more specifically on the concept of the "statistical establishment". A statistical establishment is the smallest operating entity capable of reporting all elements of basic industrial statistics. Thus a business such as a bank could be considered as a single-establishment company, counted only once in the province in which the head office is located, with no indication of the number of bank branches (locations) across the country. As a result, the number of business establishments tend to be understated, especially in smaller communities that have a relatively larger number of branch locations.

The BR contains data on businesses by employment size, based on full and part-time employees who are defined as any person drawing pay for services rendered, and for whom their employers are required to remit payroll deductions to Revenue Canada.

This working paper is based on tabulated data from the December 1996 edition of the BR, containing 973,563 business establishments, 991 of which are not in the tabulation in order to protect confidentiality. Using Statistics Canada's Postal Code Conversion File, business establishments have been assigned to census subdivisions (CSD) (2) with less than 20,000 population (smaller communities) and greater than 20,000 population (larger communities). A census subdivision is (generally) an incorporated town or municipality.

For the purpose of this working paper, 3,845 establishments in the Yukon and Northwest Territories are not considered. The working paper is based on 968,727 establishments in ten provinces.

The working paper first looks at business establishment starts in smaller communities. Business establishments are classified into "smaller communities" (census subdivisions (2) with less than 20,000 population) and "larger communities" (census subdivisions with a population of 20,000 or more).

The number of establishments in the study are organized according to the year in which establishments entered the BR. Thus, it is possible to determine whether the number of establishment starts is similar to or different in smaller and larger communities. The working paper then calculates the ratio of the number of establishments to the number of people in the community in order to determine whether or not establishments in each class size are over represented in smaller or larger communities. Given that the BR only

includes establishments with at least one employee and does not include many actual business locations, the number of establishments is most likely underrepresented to a greater extent in smaller communities and to a lesser extent in larger communities. Finally, the working paper analyzes establishments by industry type to determine whether or not leading or declining industries have located in smaller and larger communities To determine if the national results are consistent across Canada, the data are analyzed by province.

There has been a large number of business establishment starts in both smaller and larger communities

Between the beginning of 1993 and the end of 1996, there were more business establishment starts in Canada in larger communities than in smaller communities. There were almost 400,000 new starts during this period (140,000 in smaller communities and 255,000 in larger communities), indicating a strong demand for business start-ups during this period in both smaller and larger communities. The share of starts in smaller communities as a percent of total starts ranged from 34 percent in 1993 to 40 percent in 1992 or earlier (Table 1). Conversely, the share of starts in larger communities as a percent of total starts, ranged from 60 percent in 1992 or earlier to 66 percent in 1993 (Table 1).

The regions of Canada differed in the share of establishments started in smaller communities. For example, 60 percent or more of total starts were located in smaller communities in the less populated provinces of Newfoundland, Nova Scotia, New Brunswick and Saskatchewan, while 30 percent or less of total starts were located in smaller communities in the more populated provinces of Ontario and British Columbia (Table 2).

⁽¹⁾ Does not include the Yukon and Northwest Territories.

 ⁽²⁾ Smaller communities are census subdivisions (incorporated towns and municipalities) that have less than 20,000 persons. Larger communities are census subdivisions that have 20,000 or more persons.
 Data is not available to protect confidentiality.

Small communities have relatively more business establishments

If the raw number of establishments is looked at, without considering total population, there were more establishments in larger communities (62%) than in smaller communities (38%), at the end of 1996 (Table 3). If we compare this distribution to the distribution of the population, we see that smaller communities had 35 percent of the population and 38 percent of establishments in 1996. On the other hand, larger communities had 65 percent of the population and only 62 percent of the establishments at the end of 1996 (Figure 1). This pattern was followed in every province except Newfoundland and New Brunswick, where there was a smaller number of establishments in proportion to population in smaller communities (Table 4 and Figure 2).

Smaller communities have relatively more business establishments

Source: Statistics Canada. Business Registre Division, Custom Tabulation, 1996 and Census of Population, 1996. Smaller communites are census subdivisions (incorporated towns and municipalities) that have less than 20,000 persons. Larger communities are census subdivisions that have 20,000 or more persons.

Small business establishments predominate in smaller communities

Specifically, small establishments made up the overwhelming majority of total establishments in both smaller and larger communities in 1996. However, small business establishments were relatively more intense in smaller communities. Almost 65 percent of establishments in smaller communities had less than 5 employees and 82 percent had less than 10 employees. This compares to larger communities where 56 percent of establishments had less than 5 employees and 74 percent had less than 10 employees (Figure 3).

The proportion of small establishments to total establishments in smaller communities varied significantly by province. Fast growing, urban-dominant provinces such as Ontario, British Columbia and Alberta had a smaller percentage of establishments with 1 to 4 employees in smaller communities than the Canada average (see the first column of Table 6b).

Table 3. Proportion of establishments (with one or more employees) by size of community, Canada(1), 1996

Small establishments (1-4 employees) are the most common establishments in smaller communities, Canada, 1996

Source: Statistics Canada. Business Register Division, Custom Tabulation, 1996.

Smaller communities are census subdivisions (incorporated towns and municipalities) with less than 20,000 persons Larger communities are census subdivisions with 20,000 or more persons.

Smaller business establishments were distributed in smaller communities disproportionately to population

While smaller communities in Canada made up 35 percent of the population in 1996, they had 42 percent of the establishments employing 1 to 4 persons and just over 35 percent of the establishments employing 5 to 9 employees (compare the first column and the last column in Table 6b). The distribution varied by province. The provinces with a disproportionate share of small establishments in smaller communities were less populated and had fewer, faster growing urban areas. For example the difference between share of population and share of establishments with 1 to 4 employees in smaller communities was greatest in Saskatchewan, Nova Scotia and Manitoba and much less noticeable in British Columbia and Ontario. Also, British Columbia, Saskatchewan and Nova Scotia had a higher share of businesses with 5 to 9 employees in smaller communities compared to the share of total population in smaller communities in those provinces (compare the second column and the last column in Table 6b).

Table 5 In Newfoundland, 71 percent of all business establishments in smaller communities have 1 to 4 employees, 1996 (1) (2)

Service industries in Canada dominate in smaller and larger communities

In a recent study on employment in agriculture and closely related industries in rural areas, it was found that apart from the agriculture sector and industry sectors closely related to agriculture, the retail trade and community service sectors of the economy (schools, restaurants, hotels and motels) accounted for the largest employment gains in rural Canada between 1981 and 1991 (Cloutier, 1997). A similar conclusion is arrived at when the composition of business establishments in smaller communities is analyzed using the BR. In 1996, smaller communities in Canada clearly had more establishments in agriculture and other primary industries (4) than larger communities. This was due to the fact that smaller communities, as defined in this study, contain all rural areas.

What is striking however, is the importance of the service industry sectors in Canada. The service industries (5) in Canada combined, accounted for 66 percent of all establishments in smaller communities and 80 percent of all establishments in larger communities in 1996 (Figure 4). Within the overall service industry category, distributive services, which include retail trade, accounted for 29 percent of all establishments in smaller communities and 28 percent of all establishments in larger communities in 1996. Personal services, which include community services, accounted for 19 percent of all establishments in both smaller and larger communities during the same year. Producer services, which are services exported within and outside Canada, e.g., business services such as computer services, made up 22 percent of all establishments in larger communities but only 10 percent of all establishments in smaller communities in 1996 (Table 7). The smaller incidence of producer services in smaller communities is an important consideration in employment creation, given the fact that producer services are leading industries that are growing in Canada and tend to employ highly trained workers. Social services made up the remaining 9 percent of establishments in smaller communities and the remaining 10 percent of establishments in larger communities. A more detailed listing of business establishments for smaller communities in Canada, ranked by share of total establishments, is found in Appendix A.

Figure 4

Services account for 66 percent of establishments in smaller communities and 80 percent of establishments in larger communities (1), Canada, 1996 (2)

- (1) Smaller communities are census subdivisions (incorporated towns and municipalities) with less than 20,000 persons. Larger communities are census subdivisions with 20,000 persons or more.
- (2) Does not include the Yukon and Northwest Territories.

The composition of the service industries was different in different regions of Canada

As can be expected, within smaller communities, agriculture represented a higher share of establishments than larger communities in 1996 and the Prairie provinces (Saskatchewan, Manitoba and Alberta), as well as Prince Edward Island, had the highest share of agriculture establishments in smaller communities. Not surprisingly, within smaller communities, other primary industries also represented a higher share of establishments than larger communities in 1996. The provinces that had the highest shares of other primary establishments in smaller communities, in such industry groups as fishing, forestry and mining, were New Brunswick, Prince Edward Island, Nova Scotia, British Columbia and Alberta. While in larger communities, manufacturing generally represented a higher share of establishments than in smaller communities, this was not the case in all four Maritime provinces (Newfoundland, Nova Scotia, Prince Edward Island and New Brunswick), where in smaller communities, manufacturing represented a higher share of establishments than in larger communities, partly due to the fact that fish processing plants tend to be located in smaller communities. The provinces

that had the highest share of manufacturing establishments in smaller communities were Québec, Ontario and Nova Scotia (Table 7).

When looked at in total, services represented a greater share of establishments in larger communities than smaller communities in 1996.

Within smaller communities, distributive services represented a greater share of establishments than in larger communities for Canada as a whole in 1996, most likely the result of the characteristics of distributive services - they are common everywhere, and the greater number of smaller communities in Canada. Specifically, within smaller communities in Newfoundland, Québec, Ontario and Alberta, distributive services represented a higher share of establishments than in larger communities. Newfoundland, Québec and Ontario had the highest percentage of distributive service establishments in smaller communities in 1996.

Within larger communities, producer services represented a greater share of establishments than in smaller communities. However, within smaller communities in the heavily industrialized provinces of British Columbia, Alberta, Québec and Ontario, producer services represented a higher share of establishments than the Canadian average for smaller communities, suggesting that smaller communities in the wealthier provinces are somewhat benefiting from the development of these service industries.

Within larger communities, personal services represented a higher share of establishments than in smaller communities in all provinces except for Newfoundland and British Columbia. Except for the Prairie provinces of Manitoba, Saskatchewan and Alberta, all provinces had a higher share of personal service establishments within smaller communities than the Canada average of 19 percent (Table 7). It is fair to say that both distributive and personal services had essentially an equal presence in smaller and larger communities in 1996.

Within larger communities, social services represented a higher share of establishments than in smaller communities in every province except Newfoundland. Except for New Brunswick, Québec, Ontario and Alberta, the other six provinces had a higher share of social service establishments within smaller communities than the Canada average of 8 percent (Table 7).

⁽¹⁾ Other primary industries include fishing, logging and mining and oil extraction businesses.

⁽²⁾ Distributive services include transportation, communication, utility, wholesale and retail trade businesses.

⁽³⁾ Producer services include finance, insurance, real estate and business services.

⁽⁴⁾ Personal services include accommodation, food, entertainment and recreation businesses.

⁽⁵⁾ Social services include public administration, education, professional services, health, welfare and defence businesses.

⁽⁶⁾ Smaller communities are census subdivisions (incorporated towns and municipalities) that have fewer than 20,000 persons.

Larger communities are census subdivisions with 20,000 or more persons.

⁽⁷⁾ The Canada total does not include the Yukon and Northwest Territories.

Note: "x" denotes that the data are suppressed to maintain confidentiality.

Note: The rows do not add to 100 percent because some industry groups (e.g. construction) are not included in this table.

Conclusion

Although it is impossible to thoroughly analyze business establishments in smaller and larger communities in a short working paper (a more thorough investigation might crosstabulate such variables as size and industry), a number of significant observations, that might affect the type of establishments initiated, their location and employment potential, are indicated from this investigation.

The data indicates that there has been significant business establishment development in the post 1990-1992 recessionary period. Between the beginning of 1993 and the end of 1996, the number of establishment starts in Canada was significant, indicating a strong demand for business start-ups during this period in both smaller and larger communities.

The data also indicates that small business establishments (with 1 to 4 employees) are the dominant type of establishment in smaller communities. In Canada as a whole, 66 percent of establishments in smaller communities had between 1 and 5 employees in 1996. While larger communities had more business establishments than smaller communities (62 percent compared to 38 percent of the total), smaller communities had a bigger share of establishments than larger communities in proportion to their population (35 percent compared to 65 percent of the total). This pattern occurred in most provinces. Not only did smaller communities have more business establishments in proportion to their population, they also had more smaller establishments (65 percent had less than 5 employees), than larger communities (56 percent had less than 5 employees). The provinces with a disproportionate share of small establishments in smaller communities were less populated and had fewer faster growing urban areas.

The importance of service industries in Canada is one of the more striking observations from the data analysis. The data shows that in Canada as a whole, the service sector accounted for 66 percent of all establishments in smaller communities and 80 percent of all establishments in larger communities in 1996. Within the service sector, the most important finding that distinguished smaller communities from larger communities in Canada was the much smaller percentage of producer services found in smaller communities. When a regional perspective is taken into account, the more heavily industrialized provinces of British Columbia, Alberta, Québec and Ontario had the highest percentage of producer service establishments in smaller communities. This is a concern, given that producer services are a knowledge-intensive component of the services sector with great potential for further development and employment growth.

Notes

- (1) Foss basis his conclusions on analysis of data in Norway, Finland, Switzerland and the United States. He puts forward hypotheses on why establishments start up in smaller communities and points out that these hypotheses require further research before they can be proved or disproved.
- (2) Census subdivision is the general term applying to incorporated towns and municipalities (as determined by provincial legislation) or their equivalent, for example, Indian reserves.
- (3) The December 1996 BR documents the number of establishments that were in existence at the end of 1996 and the year that the establishments entered the database. From this information, it is possible to calculate the approximate age of establishments that were still in existence at the end of 1996. While the BR documents establishment deaths (establishments that entered the database and are no longer in existence at the end of a specific year), they were not used in this study. It is therefore not possible to use the BR to calculate the longevity of establishments for this working paper.
- (4) Other primary industries include: fishing & trapping, logging & forestry and mining and oil exploration.
- (5) Services are organized into type for this working paper. *Distributive services* include transportation, communications, utilities, wholesale and retail trade. *Producer services* include finance, insurance, real estate and business services. *Personal services* include services associated with accommodation, food, entertainment and recreation. *Social services* include public administration, education, professional services, health and welfare and defense.
