Executive Summary

This report presents the results of the formative evaluation of the New Horizons for Seniors Program (NHSP). The program is managed by the Community Development and Partnership Directorate within Human Resources and Social Development Canada (HRSDC) and delivered by regional Service Canada staff. During the period covered by the formative evaluation (2004-05 to 2006-07), the program had a total budget allocation of \$32.3 million.

Background

The NHSP provides grants of up to \$25,000 to community organizations (non-profit sector organizations, community-based coalitions, networks, ad hoc committees, municipal governments, band/tribal councils and other Aboriginal organizations) for a wide range of projects across Canada that encourage seniors to contribute their skills, experiences and wisdom in support of the social well-being in their communities, to build community capacity and to increase social participation and inclusion of seniors. The NHSP helps to ensure that seniors are able to benefit from and contribute to the quality of life in their communities through social participation and active living.

In its first year of operation (2004/05), the program awarded approximately \$5 million in grants. In 2005/06, the grants budget increased to \$11.7 million, and in 2006/07, it increased further to \$15.6 million.

As a result of changes announced in Budget 2007, the Program now offers three types of funding to organizations: Community Participation and Leadership; Capital Assistance and Elder Abuse Awareness.

Evaluation Scope and Methodology

The formative evaluation covered the first three years of program funding for the Community Participation and Leadership (CPL) component: 2004-05; 2005-06; and 2006-07. It was focused on six specific evaluation issues:

- whether the program is designed so that it can achieve its stated objectives and anticipated outcomes;
- whether the program has been implemented and delivered as intended;
- the efforts made to raise stakeholder awareness of the program;
- the adequacy of the management and performance information systems in place, including whether the appropriate data was being collected to support the summative evaluation;
- the production of intended outputs; and
- the achievement of short-term outcomes

Data collection and analysis for the evaluation took place between February and April 2008. Four main sources of information were used to conduct the formative evaluation: a review of documents; a review of administrative data (from the program database and a random sample of NHSP paper application files); key informant interviews (with NHSP staff and managers across the country, Regional Review Committee (RRC) members, and individuals from groups that represent seniors and/or are active in seniors issues at the national level and in each region); and a review of the results of a survey of funded and non-funded NHSP applicants. This report summarizes the findings from all four lines of inquiry.

Key Findings

Program Design

The program appears to be designed in a way so that it can realistically attain its stated objectives and outcomes. The logic model, while consistent with program documents, needs to be revisited with respect to overlapping outcomes.

Most key informants believed that the program budget was sufficient and that the grant size was adequate. The program has funded 1,730 projects over a three-year period and over two-thirds of applications were for less than \$25,000.

Key informants identified the grants-based design and use of Regional Review Committees to review applications as the main strengths of the program.

Implementation and Delivery

For the most part, the NHSP is being implemented as intended. Each region has an RRC or equivalent, and there is flexibility in how the program is delivered in each region. This flexibility allows the NHSP to be responsive to unique community needs and circumstances.

Funded applicants appear to be satisfied with most elements of the program. Non-funded applicants were less satisfied, in particular with the lack of a clear explanation about why their applications were turned down. Nevertheless, most non-funded applicants indicated that they would reapply. Both funded and non-funded applicants have become increasingly dissatisfied with the amount of time it takes to review the applications.

There appears to be relatively little duplication or overlap with other Canadian programs. There are similar programs at the provincial level in Nova Scotia and Québec, as well as for First Nations groups in British Columbia; but for the most part, the NHSP fills a unique niche in promoting the involvement of seniors in their communities.

Outreach and Promotion

The program's outreach and promotional efforts appear to be adequate. The regional staff have used a wide variety of methods to engage the communities in their regions, including mail-outs of applications kits, presentations to communities or groups, advertisements, and one-on-one communication. Over time, a greater percentage of applications have met the eligibility requirements, indicating that the regional communications and promotional efforts have been effective.

Key informants thought that outreach efforts were most effective when there was in-person contact and assistance with the application. This is taking place in every region.

Survey respondents indicated that the most useful methods of informing applicants about the program are sending information packages in the mail and posting information on the NHSP website. Both funded and non-funded applicants found the website to be an effective communications tool.

Performance Measurement and Monitoring

For the most part, NHSP has the necessary management and performance information and the administrative data/systems in place to effectively manage the program. The program has a Performance Measurement Framework (PMF) in place that identifies performance indicators and describes how program monitoring will be periodically gathered. However, lack of flexibility in the Common System for Grants and Contributions (CSGC) means that some performance measures have to be collected manually from paper files.

The NHSP is currently gathering the information that will be needed to report on the output indicators, with the exception of the number of targeted mailings promoting the program.

The performance indicators for program outputs are appropriate and informative. However, those identified as program outcomes do not give a full flavour of the intended outcomes of the NHSP. Many of these relate to outputs rather than outcomes. There is also some overlap amongst the indicators for different levels of outcomes, and between different outcomes at the same level, which contributes to confusion about what the defining features of each outcome really are. These issues could have an impact on obtaining the data necessary for a summative evaluation.

The CSGC database contains data that are sufficiently accurate and complete to meet most management needs and to inform the program's performance indicators for outputs, with some exceptions.

Production of Outputs

Evidence gathered from documents, key informants and administrative data indicate that the NHSP has produced most of its intended outputs. Regional Review Committees or equivalents have been formed in each region and they establish regional funding priorities each year. Although not all regions have formal promotional and awareness plans, all of the regions undertake a variety of promotional activities to engage target communities.

A total of 1,730 projects were approved in the first three rounds of funding and the approved projects are consistent with the program objectives and regional priorities. One concern expressed is that, as the number of eligible applications increases, so too does the time required to review and approve the applications.

A summary roll-up report is produced each year. It is estimated that the majority of funded projects submit final reports within a year of finishing up their projects¹. Exemplary projects have been identified based on information in the applications, and shared with prospective applicants. Some regions have begun to identify Success Stories based on the outcomes described in the project final reports.

Achievement of Short-Term Outcomes

There is some preliminary evidence that the NHSP is achieving its short-term outcomes. All key informants noted that, for the most part, funding decisions matched the funding priorities and community needs. It supports the engagement of seniors in identifying the community priorities and in selecting project that address those priorities.

Both funded applicants and key informants thought that the program was encouraging the use of seniors' experience, skills and wisdom. Most of the projects involved between 30 and 150 seniors, and preliminary evidence shows that seniors are involved in organizing at least some of the projects.

Most of the funded projects continue beyond the end of the funding. The program seems to increase many organizations' capacity to serve community needs by enabling them to enhance their programs and services.

Networks and partnerships are being formed as a result of NHSP. About three-quarters of the funded organizations developed new partnerships through the NHSP-funded projects. Over half of the projects had funding partners other than the sponsoring organization (usually between 1 and 4), which may contribute to the sustainability of the projects. Funding applications were often made in partnership, in some cases with new partners, in other cases existing partners.

¹ Submission of project final reports is strongly encouraged, but not mandatory.

Funded organizations estimated that a total of \$52.46 million in cash and in-kind contributions would be made by the sponsoring organizations and funding partners. This includes \$37.85 million in cash contributions and \$14.61 million in in-kind contributions. These contributions were perceived to contribute to increasing organizational capacity; and may also have contributed to the continuation of projects beyond the funding period

Summary of Recommendations

1. Improve the transparency of the decision-making process by providing clear and detailed written explanations for projects that are not awarded funding.
2. Put measures in place to decrease the amount of time required to make decisions regarding funding and streamline the departmental approval process.
3. Review and update the program's performance indicators for outputs, immediate outcomes, intermediate outcomes, and long-term outcomes.
4. Improve the capture and collation of information about the short-term outcomes of the program.
5. Ensure that CSGC data are complete for any fields that will be used for tracking performance or as inputs for the summative evaluation.

Management Response

Introduction

In the fall of 2007, a Formative Evaluation of the New Horizons for Seniors Program (NHSP) was undertaken to fulfill a commitment made in the 2004 NHSP Treasury Board Submission. The evaluation of NSHP was conducted by Human Resources and Skills Development Canada (HRSDC). We wish to thank those who participated in the NHSP Formative Evaluation: HRSDC staff; regional Review Committee members, NHSP applicants—both funded applicants and those who applied for but did not receive funding, and stakeholders. We are pleased to provide this management response.

The NHSP Formative Evaluation was designed to focus on three specific evaluation issues: the design, delivery and management of the NHSP, which included progress made towards achieving results (i.e. short-term outcomes). Four main sources of information were used to conduct the Formative Evaluation: a review of documents and files; a review of administrative data; key informant interviews (with senior government officials, NHSP and Service Canada staff and managers, Review Committee members, and representatives from groups that represent seniors and/or are active in seniors' issues); and findings from a survey of funded and non-funded applicants.

NHSP grant funding enables non-profit organizations across Canada to carry out projects that encourage seniors to be involved with their communities by sharing their skills, wisdom and experience. The overall objective is to help ensure that seniors are able to benefit from and contribute to the quality of life in their community through their social participation and active living. The Evaluation concludes that the NHSP is being implemented as intended and that the Program is designed in a way that it can realistically attain its stated objectives and outcomes. Overall, the Formative Evaluation of the NHSP provided management with the assurance that program design and delivery promotes the intended results to be reached. We acknowledge the observations in this Formative Evaluation and intend to take into consideration the key findings and suggestions outlined therein. While some areas for improvement have been identified, generally, the key findings outlined in the formative evaluation are very positive.

The Formative Evaluation made five recommendations to NHSP; below is each recommendation and the NHSP's Management Response.

Program Implementation and Delivery

Recommendation 1: Improve the transparency of the decision making process by providing clear and detailed written explanations for projects that are not awarded funding. Currently, non-funded project proponents can request a debrief indicating precisely why they were not eligible, or how they ranked in comparison to other projects that received funding. According to program representatives, many non-funded applicants do not pursue this option.

- The Department agrees that it is important to have a transparent decision making process. To this end, steps have been taken to ensure transparency, including: detailed decision template letters tailored to the reason(s) for project rejection; encouraging applicants to contact the department for a detailed explanation by a program officer; and, providing a Question and Answer for unsuccessful applicants—on the program website—that includes information on further steps that unsuccessful applicants can follow to obtain more information on the rejected application and/or ideas for future projects.
- While the onus is on the applicant to contact the Department if they would like to discuss their application, program staff also make efforts to work with non-funded applicants to make suggestions on ways to improve their proposals for future Calls for Proposals, and include this as part of their annual outreach and promotion plans.
- Ensuring that applicants fully understand the Program’s eligibility criteria when they apply for funding is key to a successful application process. When promoting the Program, Program officers suggest to organizations that they contact them as they develop a project idea to receive feedback on its potential eligibility. We have revised our program materials (application and guidelines) to reinforce this message.

Recommendation 2: Put measures in place to decrease the amount of time required to make decisions regarding funding and streamline the Departmental approval process. For example, allowing ongoing submission of applications, with the Regional Review Committees (RRCs) reviewing applications four times per year (rather than once per year) might be considered as this would likely reduce the amount of time required for funding decisions at any given sitting. It would also put less pressure on organizations to meet deadlines and so could conceivably result in better applications.

- The Department agrees with the principle of this recommendation which is to explore ways in which funding decisions can be made more quickly. Since the launch of the program, applicants have been advised when they could expect a decision – this is included in application package, on the website and in the acknowledgement letter that is sent to organizations when they submit an application. We inform them that the approval/decision-making process normally takes approximately five months from the closing date of the Call for Proposals.
- We continually look for ways in which the application process can be improved. For example, Program staff streamlined the internal approval process through the use of templates and by fast-tracking documents where possible, so that internal efficiencies are achieved. These processes have been adopted by other HRSDC programs as a best

practice. However, the high volume of the applications to be processed and the need to schedule assessment around the availability of the external review committee members limits to some extent our capacity to shorten decision timelines.

- In 2008-09, NHQ and regional officials considered the feasibility of introducing an on-going application intake process on a pilot basis--through a working group created to examine this issue. The consensus of this regional working group was that the measure would not be a feasible option at this time. The Program works with a network of external review committees, whose membership includes government officials, seniors, and representatives from seniors and other community organizations. The committee members, who are mainly volunteers, assess and recommend proposals. For the on-going intake process to be effective, the committees would have to meet on a more frequent basis to assess and recommend applications.
- A key concern is the capacity and availability of the review committee members to participate in additional assessment processes. The review committees were established in 2004 when the Program was smaller, both in terms of budget and the number of funding streams. The committees now review a large volume of applications for both the CPL and CA funding components -- over 2200 applications were reviewed in 2008-09. Review committee members make a significant time commitment to come together twice a year for the CPL and CA assessment processes. Many committee members have expressed concerns about the extent of the commitment that is now required of them and would be reluctant to participate in additional meetings.
- The application intake and assessment process will be reviewed in 2009-10 in light of the findings of the implementation review of the CA funding stream, which includes key informant interviews with review committee members.

Performance Measurement and Monitoring

Recommendation 3: Review and update the program's performance indicators for outputs, immediate outcomes, intermediate outcomes, and long-term outcomes. Indicators should be directly relevant to the output or outcome, feasible to measure over time, and, cumulatively, should provide sufficient benefit to justify the burden of ongoing measurement.

- The Department agrees with this recommendation. The current performance measurement framework (PMF) contains key performance indicators (KPI's) which are relevant to the outputs and immediate/ intermediate outcomes contained in the Program's Logic Model. These KPI's are populated annually for each round of funding—after the project approval process and reports are produced annually. These KPI's are strong output indicators, however, developing strong outcome indicators for the PMF has been challenging. Upon review of the recommendations in the formative evaluation report (i.e. the assessment of NHSP performance measures within the Document Review Technical Report), Program staff did further work on the PMF. This work included adding some indicators as recommended by the evaluators and further refinement of the wording of other indicators. This activity was completed in fall 2008.

- Measuring the achievement of long-term outcomes is very challenging for most programs of a social development nature. In the case of the NHSP, the stated long-term outcome is “vibrant and inclusive communities that benefit from the increased participation of seniors in community life”. Measuring the degree of achievement of this outcome is complex due to the attribution effect, i.e. there are other social development initiatives (by various levels of government) that also positively contribute towards the achievement of this outcome. The evaluators have provided some suggested outcome indicators. These require further study, along with other potential indicators, to determine whether appropriate indicators can be identified that can be measured in a practical, cost-effective and ongoing way by project sponsors or through the evaluation process, (e.g. “actual” networking by seniors within funded projects may be difficult to quantify).
- The Impact Evaluation of CPL is now underway and early results, which will provide additional feedback on the program outcomes and measures, will be available in fall 2009. While the Program awaits the results of this evaluation activity, a review will be initiated in Fall 2009 of the NHSP logic model, outcomes and related measures to ensure that both the cause and effect relationships are consistent with the Program’s intent and that the appropriate outcomes, indicators and measures can be developed. Guidance will be sought from experts in the field of evaluating social development programs to assist with this exercise that will target on arriving at fewer and better Key Performance Indicators for NHSP.

Recommendation 4: Improve the capture and collation of information about the short-term outcomes of the program. This information is available in the project final reports, but is not captured in a database that can be readily analysed. One possibility would be to adapt the CSGC to capture this type of information.

- The Department agrees with this recommendation. NHQ recognizes that the final reports from projects provide valuable quantitative and qualitative information that is essential to report on a number of the KPI’s. The current project management database, the Department’s Common System for Grants and Contributions,(CSGC) captures some of the final report information in the Close-out Summary screen. However, this database does not meet the Program’s ongoing performance and program reporting requirements as it was not designed in a way that can capture all of the pertinent information from the final reports. An analysis of the feasibility of modifying the CSGC Close-out summary is underway.
- To counter for this weakness in the CSGC, NHSP Program officials have developed a data collection process to capture a set group of success indicators from the final reports information of the Community Participation and Leadership (CPL) component. Program officials in the regions have been tasked with the responsibility of extracting and recording the data from the final reports in a nationally developed tool. This information will be rolled up into a Microsoft Access database which will then allow the data to be synthesized and used for analysis. This activity has commenced and is scheduled for completion in spring 2009. In 2009-10, it will be expanded to capture information for projects funded under the Capital Assistance and Elder Abuse Awareness components of the program.

Recommendation 5: Ensure that CSGC data are complete for any fields that will be used for tracking performance or for the summative evaluation (e.g., number of participants, number of seniors, approval date, OLMC, amount of funding requested, project status).

- The Department agrees with this recommendation. These activities are ongoing and Program officials will continue to stress the importance of comprehensive and accurate data entry. NHQ provides guidance to the Regional program staff on the Program's forms and templates and the CSGC data entry procedures and timelines. In summer 2008, NHQ updated the program's operational manual for CSGC data entry. Regional staff are reminded about new data entry requirements and or emerging issues through e-mails, teleconferences and bulletins. CSGC data entry and the importance of field completion—including non-mandatory fields used in classifying projects—are also addressed during learning forums and orientation/training sessions.
- The new Service Canada structural model for program delivery brings together labour market and social development programming under a consistent organizational structure across regions. This should also provide enhanced opportunities for more consistent processes and training.

Future Application of NHSP Formative Evaluation Recommendations

In summary, the initial conclusions of the evaluation are quite positive and provide good recommendations for improvements to the Department's management of the Program. This evaluation further contributes to the Department's accountability and has resulted in the further refinement of the key performance indicators and the development of a data collection strategy for final reporting information. The evaluation conclusions and recommendations will continue to inform NHSP's planning, priorities and future investments in results reporting.

1. Introduction and Context

This final summary report presents the findings of the formative evaluation of the New Horizons for Seniors Program (NHSP), which focused on design, delivery and management issues and examined the activities, outputs and short-term outcomes of NHSP.

The report is organized in five sections:

- Section 1 describes the program as well as the context of the evaluation, including the purpose of the evaluation and the issues being explored.
- Section 2 describes the methods that were used to collect and analyse data, and outlines the strengths and limitations of the methodology.
- Section 3 summarizes the key findings for each evaluation question, drawing from the findings of all lines of inquiry.
- Section 4 presents conclusions drawn from the findings.
- Section 5 identifies specific recommendations for the New Horizons for Seniors Program.

1.1 Program Description

The NHSP provides grants of up to \$25,000 to community organizations for a wide range of projects across Canada that encourage seniors to contribute their skills, experiences and wisdom in support of the social well-being in their communities, to build community capacity and to reduce the risk of social isolation of seniors. The specific objectives, identified in the program's 2004 Terms and Conditions, are to:

- Harness the skills, experience and wisdom of seniors to help themselves and their community;
- Reduce the risk of social isolation of seniors;
- Strengthen social foundations at the community level and invest in social wellbeing;
- Ensure all seniors are able to benefit from, and contribute to, the quality of life in their community through social participation and lifelong active living; and
- Develop governance approaches that encourage provincial, territorial and municipal governments as well as voluntary, social economy and non-profit sector, to work collaboratively within communities to effectively address existing or emerging issues.

1.1.1 Inputs

The NHSP was implemented following the 2004 Budget, which announced \$8 million in funding for 2004-05. In response to overwhelming demand, the Government of Canada announced an increase in funding to the NHSP by an additional \$5 million (for a total budget of \$13 million) in 2005-06, and \$10 million (for a total budget of \$18 million) in 2006-07. Table 1 provides a breakdown of the budget for each fiscal year.

Table 1 Annual NHSP Budget			
Funding Year	Grants Budget	Operation & Maintenance (O&M) Budget	Total Budget
2004-05	\$5,000,000	\$3,000,000	\$8,000,000
2005-06	\$11,700,000	\$3,300,000	\$15,000,000
2006-07	\$15,600,000	\$4,400,000	\$20,000,000
Sources: Grants budget from annual roll-up reports; total budget from NHSP Allocation Model & Operations Guide; O&M budget computed by subtracting the grants budget from the total budget			

1.1.2 Activities and Outputs

Figure 1 shows the logic model for NHSP as of April 2007, depicting the activities and outcomes of the program during the time period of the evaluation.² The logic model reflects the activities, outputs, and outcomes of the program, with one exception: the output of “networks and partnerships” was subsequently eliminated as an output³, and so is not included in this evaluation.

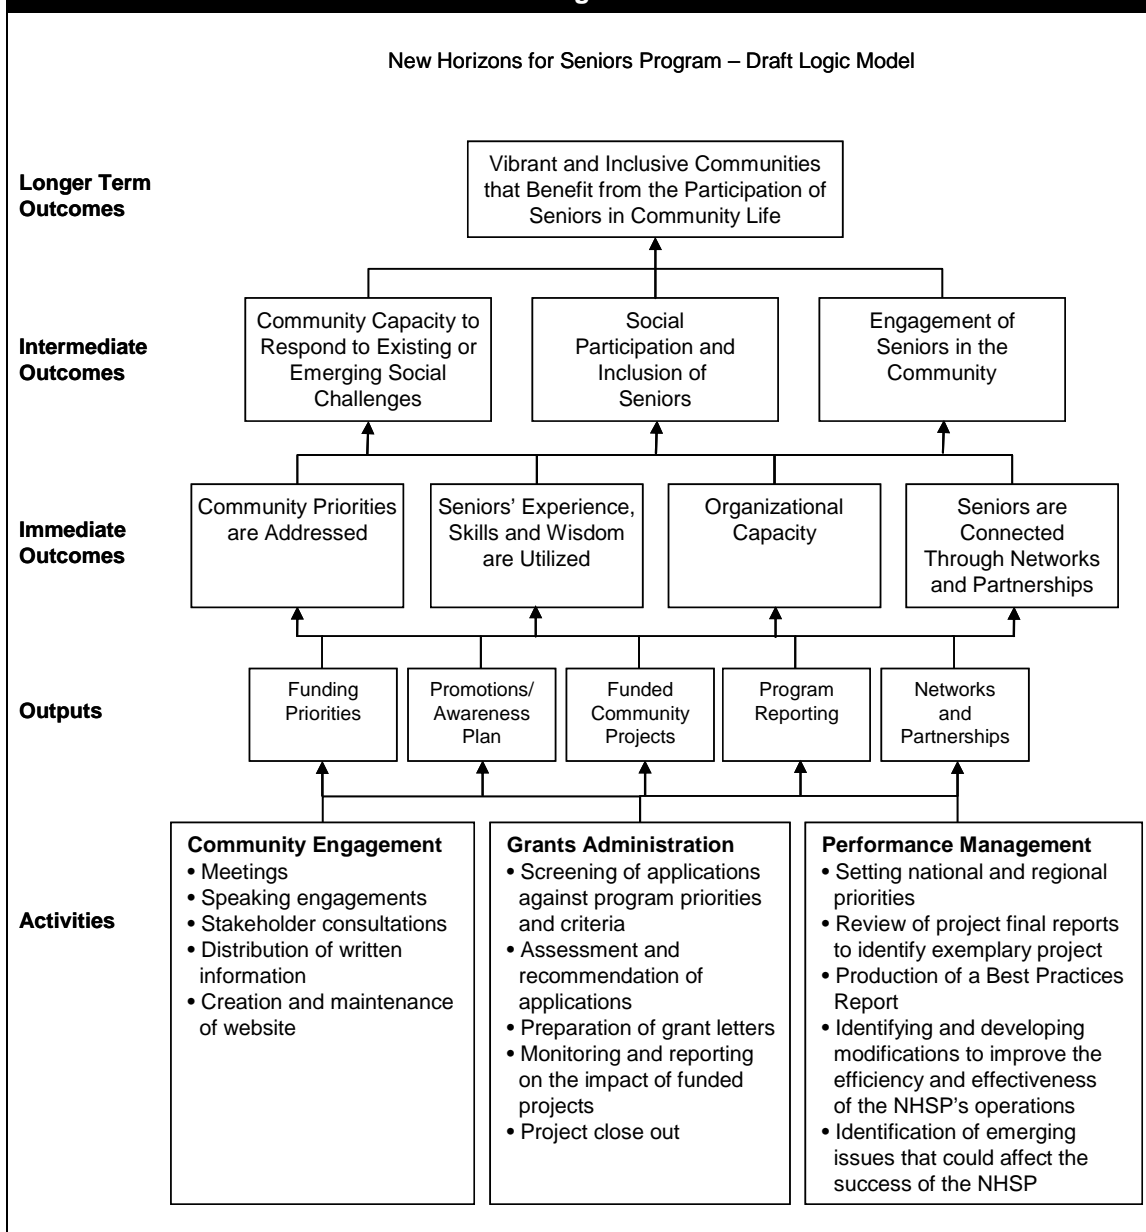

The specific activities of the NHSP are:

- *Community Engagement:* Informing stakeholders and targeted communities about what the NHSP is trying to accomplish and how organizations can access funding (e.g., through meetings, speaking engagements, stakeholder consultations, distribution of written information, and the NHSP web site). It also includes the establishment of Regional Review Committees and the setting of priorities to guide calls for applications.
- *Grants Administration:* Administering grants agreements encompasses a range of activities, such as developing the call for applications, screening proposals, assessing and recommending applications, preparing grant letters, monitoring and reporting on the impact of funded projects, and closing out the projects once they are complete.
- *Performance Management:* Ongoing program management and improvement that includes reviewing project final reports to identify Success Stories that could be shared with the NHSP’s stakeholder groups; producing a Best Practices report; continuous review and improvement of program processes; and identification of emerging issues that could affect the program’s success.

² There were earlier logic models that differed slightly from this one, however, the April, 2007 logic model most closely reflects the NHSP during the period relevant to the formative evaluation.

³ Networks and partnerships were determined to be an outcome of the program, rather than a direct result of program activities.

Figure 1
NHSP logic model

The outputs of these activities are:

- Identification of funding priorities that are appropriate to the regions.
- Development and implementation of regional promotions/awareness plans, so that groups who might apply and be eligible for funding are aware of the program and understand both the purpose of the funding and the selection criteria.
- Granting of funds to projects that meet program criteria and regional priorities.
- Annual summary reports for the program, continuous program improvements, and examples of Success Stories that can be used as a promotional tool to develop similar projects in other communities.

1.1.3 Grant Eligibility

Activities eligible for NHSP funding include: the active engagement of seniors in the social well-being of their communities; promotion of social citizenship; strengthening of social capital through partnership and network building; investments in community social infrastructure; and knowledge generation and learning that results in social innovation.

Activities must be incremental, augmenting and not duplicating those currently existing in the community. They must be non-profit in nature; address local community priorities and interests; be consistent with NHSP objectives; and respond to departmental priorities. In addition, activities must be inspired by seniors, implemented by seniors and benefit seniors.

1.1.4 Program Outcomes

The funded projects should collectively contribute to the NHSP short-term outcomes, which are expected to be achieved within one to three years. These are:

- Community priorities are addressed;
- Seniors' experience, skills and wisdom are utilized;
- Funded organizations have increased capacity to serve community needs;
- Seniors are connected through networks and partnerships.

The short-term outcomes should lead to intermediate outcomes that will be achieved within three to five years. The intermediate outcomes for NHSP are:

- Community capacity to respond to existing or emerging social challenges.
- Social participation, empowerment and inclusion of seniors.
- Engagement of seniors in the community.

Over the long-term, the NHSP is intended to result in vibrant and inclusive communities that benefit from the increased participation of seniors in community life.

1.1.5 Program Management and Delivery

The New Horizons for Seniors Division of National Headquarters (NHQ) is responsible for managing the program. This includes responsibility for monitoring all program expenditures and activities, both at the national headquarters and the regional levels, as well as for monitoring projects and their outcomes. Program outcomes are assessed in the context of evaluations.

Service Canada regional staff are responsible for the ongoing delivery of NHSP. Regional staff are also responsible for community engagement and liaison, establishing and supporting the operations of their Regional Review Committees (RRCs) and establishing

and maintaining partnerships with provincial and territorial officials on NHSP matters. Financial resources are provided to regions to support these functions. Program delivery does vary by region (e.g., different stakeholder engagement methods are used in different regions; each region has its own set of priorities for funding, etc.).

In all regions except Québec, voluntary Regional Review Committees (RRCs) have been established with representation from all three levels of government, seniors' organizations, seniors themselves, and other people active in seniors' issues. This approach is intended to take account of regional differences in program delivery. Supported by regional staff, RRCs in each province and territory are mandated to set priorities for project solicitation, develop criteria for individual project assessment, and recommend and rank projects for approval by HRSDC.

In Québec, a Joint Management Committee (JMC) fills the role of the RRC. The JMC includes regional NHSP representatives, as well as representatives from the Secrétariat aux aînés du Québec. This arrangement enables the province to coordinate the NHSP funding process with that province's Du coeur à l'action pour les aînés du Québec / Heartfelt Action for Québec's Seniors (formerly the Engagés dans l'action pour les aînés program), which has similar objectives relating to the social participation of seniors.

1.2 Evaluation Context

The formative evaluation was intended to help improve the program. It focused on design, delivery and management issues, and examined activities, outputs and short-term outcomes of NHSP. The evaluation was guided by the following questions.

Program Design

1. Is the program designed in such a way that it can realistically attain its stated objectives and anticipated outcomes?
 - Does the logic model reflect how the program currently operates?
 - Is the logic model adequately reflecting the program links between the activities and the expected outcomes?

Program Implementation and Delivery

2. Is the NHSP implemented and delivered as intended?
 - Should changes be made to program delivery to improve its efficiency and effectiveness?
 - Are resources sufficient?

3. What efforts have been made to raise the stakeholder community's awareness of the program?
 - What kind of outreach was done?
 - How effective was it?
 - What are the barriers, if any?
4. Does the program have adequate management and performance information and administrative data/systems to effectively and efficiently manage the program?
 - Are the performance measurement indicators adequate and appropriate?
 - What is the quality of the available performance data?
 - Is the data needed for a summative evaluation being collected?
 - Are there gaps to be filled?

Early Results

5. To what extent has the program produced its intended outputs?
 - What is the profile of projects in each of the regions?
 - What barriers work against achieving the intended outputs?
 - What supports the achievement of the intended outputs?
6. To what extent has the program achieved its short-term outcomes?
 - What barriers work against achieving the intended outcomes?
 - What supports the achievement of the intended outcomes?
 - What unintended outcomes have occurred?

2. Evaluation Methods

The evaluation gathered information through four different lines of inquiry: a document review; key informant interviews; administrative data and file review; and a survey of applicants. The evaluation issues matrix in Appendix A shows the lines of inquiry that were used to collect information for each of the evaluation issues and questions. This section briefly describes each of the methods used.

2.1 Document Review

Program documents were reviewed at both the national and regional levels. At the national level, documents included the program's Results-Based Management and Accountability Framework (RMAF), Performance Measurement Framework, Program Terms and Conditions, the Early Implementation Review report, the Operations Guide, budgets, annual reports, forms used in delivering the program, and communications with the regions. These documents helped to develop a description of the program. Regional documents included promotions/awareness plans, records of outreach and communications, regional review committee records, examples of innovative projects, and any region-specific tools used in screening and assessing proposals. These documents, by providing information about how the program operated at the regional level, were useful in highlighting the similarities and differences between regions.

The information from the documents was analyzed using content analysis based on the evaluation questions. Relevant information from each document was organized by evaluation question, and the overall findings and conclusions were summarized for each evaluation question, with notations of agreement or discrepancies between different documents.

2.2 Key Informant Interviews

Interviews were conducted in February and March, 2008 with 58 key informants: two senior government officials; 22 NHSP staff and managers (both national and in each region); 14 Regional Review Committee (RRC) members (including all regions except for the Northwest Territories); and 20 representatives from stakeholder groups (i.e., groups that represent seniors and/or are active in seniors issues at the national level and in each region. Some, but not all of these groups, had received funding from NHSP). The breakdown of interviews by group and region is shown in Table 2.

Table 2 Breakdown of Interviewees by Group and Region				
Region	Senior Government	NHSP Staff and Managers	RRC Members	Stakeholder Group Representatives
National	2	6	n/a	2
Alberta	0	2	2	2
British Columbia	0	2	1	1
Manitoba	0	1	1	1
New Brunswick	0	1	2	1
Newfoundland & Labrador	0	1	1	1
Nova Scotia	0	1	1	1
Nunavut	0	1	1	2
Northwest Territories	0	1	0	1
Ontario	0	1	1	1
Prince Edward Island	0	1	1	1
Québec	0	2	1	3
Saskatchewan	0	1	1	2
Yukon	0	1	1	1
Total	2	22	14	20

Interviews were conducted by telephone because of the large geographic distances involved in this project. Using telephone interviews made it possible to conduct a large number of interviews within the evaluation budget, and also enabled the evaluators to schedule interviews at times convenient to the respondents.

Key informants were selected purposefully, so that those interviewed were the most knowledgeable within their group about the program as implemented between 2004-05 and 2006-07. The national managers identified appropriate regional staff and senior officials to interview, and regional program staff identified appropriate RRC members and stakeholder groups.

Depending on their level of involvement with the program, key informants were asked about program design, delivery, communication and outreach, administrative/performance information, the process of making funding decisions, and program improvements. Interviews with program staff, managers, and RRC members were approximately one hour. Interviews with senior officials and other stakeholder groups lasted between 20-30 minutes. All but one of the interviews were conducted by telephone.

A coding key was developed after a preliminary review of the interview notes. The coding key included common themes that emerged from the notes. The interview data were then analysed thematically using NVivo qualitative analysis software. Interview responses were coded according to the type of key informant and region, so that themes for each group could be identified if required. Each theme was then summarized, using the words of the respondents if possible.

An indicator of the number of times a theme was mentioned was incorporated into the narrative, using the following descriptors:

- **No/none:** no individual identified the particular issue or topic.
- **Few/very few:** one or two individuals expressed a particular opinion.
- **A minority:** between one-quarter and one-half of the individuals interviewed expressed a particular opinion.
- **A majority:** the majority of, but not all, individuals were of the same opinion and/or held similar perceptions regarding a selected issue or topic.
- **All:** All interviewees questioned on the topic expressed the same view or held the same/similar opinion.

2.3 Administrative Data Review

The administrative data review included information stored electronically in the Common System for Grants and Contributions (CSGC), as well as information from the paper files of a stratified random sample of applications and funded projects.

The CSGC contains data on NHSP activities and expenditures, project proposal information, and project reporting information. The review of CSGC data included *all* applications submitted between 2004-05 and 2006-07, inclusive. The relevant fields were extracted from the database, and imported and analysed using SPSS.

The paper files included application forms, screening and assessment materials, and for funded projects final project reports. A random sample of these files was reviewed, stratified by funding year and application status (ineligible, rejected, and awarded). The purpose was to gather data for the evaluation, as well as to assess the quality of the data in CSGC. The sample included, for each funding cycle and region:

- 5% of applications that were deemed ineligible (sample size = 81);
- 5% of applications that were eligible but rejected (sample size = 37); and
- 10% of applications that were awarded funding (sample size = 173, but only 168 files were provided by the regions).

The sample was drawn by the evaluators, and the regional staff provided copies of the paper files for the sampled projects. Relevant information from the files was entered into an SPSS database and analysed. Qualitative data were coded, using a coding key, prior to being entered into the database.

The accuracy and completeness of the CSGC data were also assessed, with the sample of paper files serving as the reference point for assessing accuracy.

2.4 Survey of Applicants

A telephone survey was conducted in August and September 2007 with two main audiences:

- Organizations that received funding from NHSP; and
- Organizations that applied for funding but did not receive funding (i.e., were deemed ineligible for funding or were rejected).

The survey samples were stratified by region, project component, funding amount and year of funding, as well as by application status (rejected or ineligible) for those who applied for funding but did not receive it. The samples included applicants who had applied for funding between 2004-05 and 2006-07 inclusive.

The survey questionnaires were designed in collaboration with HRSDC Evaluation Directorate. The questionnaires asked about characteristics of the grant recipient organizations, outcomes of the funded projects, and perceptions of various elements of the program. The surveys were conducted during daytime business hours, using Computer Assisted Telephone Interviewer (CATI) software.

A total of 1,745 interviews were completed, including 958 interviews with funding recipients and 787 with applicants who did not receive funding. The response rate for the “funded” sample was 56%, while the response rate for the non-funded sample was 69%. The approximate margin of error for a sample of this size is +/-2.8 for the funded sample and +/-3.1 for the non-funded sample, at the 95% confidence interval.

Responses to open-ended questions were coded thematically. Frequencies were calculated for both open- and closed-ended items. Frequencies were computed separately for those applicants who received funding and those who did not. The data were weighted to ensure that the aggregate sample was representative of the entire universe, based on region, funding cycle, and amount of funding.

2.5 Strengths and Limitations of the Methodology

The evaluation collected data from multiple sources using multiple methods; data triangulation increases confidence in the findings.

The documentation for the NHSP is extensive and the documents are largely consistent with one another, which enhances our confidence in the findings from the document review.

The large number of topics covered in the telephone interviews present both strengths and limitations: it allowed interviewers to capture opinions on a wide range of issues; however, there was little time for interviewers to probe for more in-depth responses. The mode of interview (telephone) also had some disadvantages, as it prevented the interviewer from noticing non-verbal cues.

The NHSP collects information in the Common Systems for Grants and Contributions (CSGC) database about every application it receives. For the most part, the relevant data in this system were complete and accurate. This provides a highly reliable source of data for the evaluation. However, there were some areas where the data were incomplete (e.g., the number of participants in the funded projects was not completed for every project). Furthermore, in some instances, there were slight differences between reports generated by the program and the results obtained through the CSGC, and it was beyond the scope of the evaluation to determine which numbers were most accurate. These instances have been noted in the text of the report, and the source used has been clearly identified.

The review of paper files supplemented the CSGC, as the files included more extensive information about the projects, including project outcomes based on the final reports. Time and budgetary constraints required that a relatively small sample of paper files be drawn. In particular, only 10% of the funded projects were reviewed. This is not a statistically representative sample. Therefore, findings from the paper files (and particularly from the final project reports) need to be treated as a rough estimate rather than a precise reflection of what is happening in all projects.

Finally, information about the short-term program outcomes is based primarily on perceptions, and should therefore be interpreted with caution. Key informants often indicated that they were speculating when providing information about the program outcomes.

3. Key Findings

This section presents a summary of the key findings, organized by evaluation question.

3.1 Program Design

Evaluation Question 1: Is the program designed in such a way that it can realistically attain its stated objectives and anticipated outcomes?

- Does the logic model reflect how the program currently operates?
 - Is the logic model adequately reflecting the program links between the activities and the expected outcomes?
 - Are resources sufficient?
-

Accuracy of the Logic Model

Figure 1 (see page 3) shows the logic model for NHSP as of April, 2007, depicting the activities and outcomes of the program when it was implemented in 2004. The activities and outcomes are described in section 2.1 of this report.

The logic model is consistent with other program documents reviewed for the evaluation, and accurately reflects the activities, outputs, short-term outcomes of the program, with one exception: the output of “networks and partnerships” identified in the logic model was eliminated as an output and made instead an outcome⁴.

There is overlap amongst several of the outcomes in the logic model. For example, the intermediate outcome of engagement of seniors in the community overlaps substantially with that of social participation and inclusion of seniors. This overlap makes the logic model less useful as a tool for a) clarifying the goals of the program, and b) providing direction for the summative evaluation.

Adequacy of Program Resources

The NHSP grant funds are allocated to the regions using a national allocation model. Table 3 presents financial information about the grant funds allocated and awarded within each region, as found in the annual roll-up reports. Looking at this information over time sheds some light on the issue of resource sufficiency.

⁴ Networks and partnerships were determined to be an outcome (not an output) of the program.

Table 3
Annual Resource Allocation and Spending by Region

Region	Funds Allocated (\$ 000s)			Funds Approved ⁵ (\$ 000s)			% of Available Funds Approved		
	04/05	05/06	06/07	04/05	05/06	06/07	04/05	05/06	06/07
Alberta	\$398.7	\$935.4	\$1,247.6	\$398.7	\$755.6	\$746.1	100%	81%	60%
British Columbia	\$651.3	\$1,569.6	\$2,100.7	\$651.3	\$1,624.3	\$1,745.8	100%	103%	83%
Manitoba	\$219.4	\$485.2	\$642.0	\$219.4	\$485.2	\$598.9	100%	100%	93%
New Brunswick	\$159.0	\$333.5	\$437.9	\$155.6	\$463.4	\$352.4	98%	139%	80%
Newfoundland & Labrador	\$120.0	\$236.0	\$306.2	\$120.0	\$310.1	\$427.1	100%	131%	139%
Nova Scotia	\$190.0	\$410.4	\$541.4	\$189.6	\$461.8	\$508.5	100%	113%	94%
Nunavut	\$50.8	\$61.9	\$72.5	\$25.0	\$185.2	\$50.1	49%	299%	69%
Northwest Territories	\$51.9	\$64.8	\$76.5	\$78.9	\$81.9	\$84.4	152%	126%	110%
Ontario	\$1,706.2	\$4,217.5	\$5,662.9	\$1,698.5	\$3,614.8	\$5,441.7	100%	86%	96%
Prince Edward Island	\$70.5	\$111.4	\$139.1	\$70.5	\$110.5	\$142.1	100%	99%	102%
Québec	\$1,122.5	\$2,752.3	\$3,692.0	\$1,152.0	\$2,273.0	\$3,304.2	103%	83%	89%
Saskatchewan	\$208.1	\$457.0	\$604.0	\$188.4	\$338.8	\$582.8	91%	74%	96%
Yukon	\$52.1	\$65.4	\$77.2	\$52.1	\$83.5	\$19.2	100%	128%	25%
Canada	\$5,000.0	\$11,700.0	\$15,600.0	\$5,000.0	\$10,788.2	\$14,003.3	100%	92%	90%

Source: annual roll-up reports

The overall grant funds allocated to the regions, as well as the total funds approved, increased steadily over the three-year period, as can be seen in Table 3 as well as Figure 2. In 2004/05, the funds allocated for grants were \$5 million, and the total amount approved was the same. In subsequent years, the grants budget increased substantially. In each of these years, the budget exceeded the amount of grants approved. The grants budget allowed NHSP to fund 1,730 projects, including 338 in 2004/05, 614 in 2005/06, and 778 in 2006/07.

The average grant size per funded project was \$17,232.

⁵ There were some discrepancies in the amount of funds approved between the CSGC findings and the regional roll-up reports, none of them more than \$25.5k. One potential reason for the discrepancies is that some organizations who were approved for funding subsequently “withdrew” the project (due to inability to implement it). The amounts from the roll-up reports are shown in this table. The amounts from CSGC were as follows:

- Alberta: \$730.4k approved in 2006/07
- New Brunswick: \$165.6k in 2004/05, \$476.9k in 2005/06, and \$340.7k in 2006/07
- Nova Scotia: \$518.5k in 2006/07
- Northwest Territories: \$66.4k in 2006/07
- Québec: CSGC \$1,177.5k in 2004/05 and \$3,295.2k in 2006/07
- Saskatchewan: \$598.6k in 2006/07

Figure 2
Value of grants and number of projects funded, by year

Source: CSGC

A majority of the staff, managers, senior officials, and RRC members who were interviewed for the evaluation thought that the program budget was sufficient. A few respondents felt that the program budget was insufficient to fund all of the projects they had wanted to support.

The differences in opinion about the sufficiency of the program budget may be due to differences in allocation among the regions. According to the report from the Early Implementation Review, the Resource Allocation Model for NHSP grant funding was developed based on the size of the seniors' population in each region, and was applied consistently across the country. Grant funds were allocated to each of the regions using a base allocation of \$50,000 (\$60,000 in 2005/06 and \$70,000 in 2006/07), which was topped up based on the percentage of seniors in the region. From Table 3, it can be seen that some regions spent more than their allocated amounts, suggesting that the allocated resources were in fact insufficient. However, unused funding from larger regions is commonly re-distributed to smaller regions on an as-needed basis. For example, while Saskatchewan has consistently under-spent its allocated budget, Newfoundland and Labrador has paid out over 30% more than its allocated budget for the second and third rounds of funding. Regional overspending occurred mostly in 2005-06 in the territories and Eastern provinces.

Twenty percent of the funded projects were awarded less funding than they had requested⁶. These projects were awarded, on average, about \$7,000 less than they had requested. Some regions had much larger percentages of projects that were awarded less funding than they had requested, such as the Northwest Territories (69%), Prince Edward Island (64%), Manitoba (48%), and Québec (40%). The evaluation did not identify the reasons for this, but the program may wish to explore this phenomenon further⁷.

Grant Size

The majority of the key informants interviewed thought that the grants were of sufficient size. However, a minority thought that the grants were too small, especially in remote areas such as the Northwest Territories or Nunavut (interviewees noted that program materials are more expensive in these regions, because the cost of shipping and transportation is high). It was also noted that while \$25,000 was sufficient to support local projects, the ceiling on project funding precluded funding on a province-wide scale. However, funding of province-wide projects is not one of the program's objectives.

A review of the applications in the CSGC database shows that 69% of applicants requested less than \$25,000. On average, applicants requested \$18,691. Combined with the interview responses, this suggests that for most applicants that are being targeted by the program, the \$25,000 grant size is sufficient.

Adequacy of Program Activities/Outputs

Key informants were asked to comment on the likelihood of achieving the program objectives, in light of the activities and resources available. A majority indicated that the program was likely to achieve its objectives. Of these, a majority thought that it was important that the program was grants-based, because the simpler administration, application, and reporting process makes it possible for smaller organizations to apply for the funding. A majority also thought that the use of RRCs to review the applications was particularly effective, as the RRC members bring a lot of experience and knowledge about the community and its needs, and are able to make better decisions than individuals who might not be as familiar with the needs of the region.

A minority of the interviewees thought that the program was somewhat likely to achieve its objectives, and very few thought that it was not at all likely. Some of the concerns raised by these interviewees were that the projects would not continue without ongoing funding, especially when organizations already have ongoing projects that require funding. Another concern was that the projects are by necessity short-term, since the funding covers only a one-year time frame.

⁶ All but five of these projects had requested grants within the \$25,000 limit.

⁷ One hypothesis that was explored was that regions with insufficient funds to cover all projects would be more likely to award lower funding than had been requested. However, this hypothesis was not supported by the data. There was no evident relationship between the percent of available funds approved and the percent of projects receiving less funding than requested.

Other interviewees noted that the program provides seed money that gives organizations an opportunity to set up projects that address community needs and, if they turn out well, the organization may then be able to sustain them over the long run.

Anticipated Project Outcomes

A review of a sample of the project application forms found the following:

- 84% of applicants expected the project to increase inclusion and decrease isolation for seniors;
- 64% expected it to give seniors an opportunity to express themselves or share their knowledge, skills and values with others;
- 54% expected to build intergenerational understanding and respect; and
- 44% expected to develop seniors' knowledge and skills.

These expected outcomes are consistent with the program objectives.

Summary

- The logic model is consistent with other program documents and for the most part does accurately reflect the activities, output, and outcomes of the program. However, overlap amongst the outcomes reduces the clarity of the model.
- The funds awarded and number of projects funded increased substantially over the three years, as the program budget increased.
- By 2006/07, there seems to have been sufficient funds allocated, at a national level, to fund all projects deemed by the RRCs to be deserving of funding, although some regions required funding beyond their regional allocations.
- Grant size was thought to be sufficient by most (but not all) interviewees. Over two thirds of the applications were for less than the maximum grant per project of \$25,000.
- Key strengths of the program design, according to interviewees, were the fact that it is grants-based, and the use of RRCs to review applications.
- Anticipated project outcomes appear to be consistent with the program objectives, which increases the likelihood of achieving the program goals.

3.2 Program Implementation

Evaluation Question 2: Is the NHSP implemented and delivered as intended?

Should changes be made to program delivery to improve its efficiency and effectiveness?

Planned and Actual Implementation

As described in section 2.1.5, the NHSP is intended to be managed at a national level by the National Headquarters (NHQ), which includes overarching planning, communications with the regions, maintaining the NHSP website, staff training, monitoring, and continuous program improvement. The program is delivered by HRSDC/Service Canada regional staff. Each year, the following steps are intended to take place:

1. Regional funding priorities, established by the RRCs, are used as the basis for the Call for Applications.
2. Regional staff engage local organizations to inform them about the Call for Applications and provide assistance in preparing proposals (e.g., by helping them understand what is required and what types of projects are eligible for funding).
3. Applications are submitted on or before the application deadline.
4. Information from the applications is entered into the CSGC database. This information is updated as the application is processed and as funded projects are carried out up to the time projects are closed out.
5. Regional staff screen applications to ensure they meet the program's eligibility requirements. In some limited instances, regional staff may request further information from the applicant.
6. RRCs meet to review the eligible proposals and carry out a more thorough assessment of whether or not the application will contribute to the program goals.
7. RRCs make a recommendation about whether to approve or reject the application.
8. Final approval is made by a delegated authority within Service Canada or HRSDC (a regional director or the Minister).
9. Letters are sent out notifying successful applicants of how much funding they have received. Unsuccessful applicants are informed the reasons why they were not awarded funding.
10. Funding is distributed and the projects are implemented.
11. The local Members of Parliament make announcements in their communities.
12. Regional staff monitor the funded projects (at a minimum, calls are made one month after the funding is issued and one month before the planned end date of the project).
13. Projects submit a final report upon completion of the project.

14. Regional staff review final reports and identify Success Stories.
15. An annual roll-up report and Best Practices report are produced.
16. Program staff identify improvements to the program prior to the next funding round.

Both the interviews and the review of documents indicate that the program is being implemented as intended, with some minor variations. The work processes are well-documented, and the tools and templates for program delivery that were developed by NHQ are being consistently used by the regions. There is some variance and flexibility in how the program is delivered in each region, and this is in line with the NHSP desire to be responsive to unique community needs and circumstances.

The only major variations from the intended process are:

- Exemplary projects are identified based on applications. The program appears to be working towards documenting Success Stories based on the project final reports, but this is not yet done in all regions.
- Although no Best Practices report has yet been produced, program representatives indicated that best practices and improvements are discussed with all Regions at the Annual Learning Forum.

The program is implemented somewhat differently in Québec, where a Joint Management Committee of federal and provincial government representatives has been established to fill the roll of the RRC. Community input is received from Quebec's network of Tables de concertation des aînés. This arrangement is formalized in a Memorandum of Understanding between the Québec government and the government of Canada. The JMC takes into account both the objectives of the NHSP and the objectives of the Du coeur à l'action pour les aînés du Québec / Heartfelt Action for Québec's Seniors (formerly the Engagés dans l'action pour les aînés program, a substantially similar program in Québec) when making recommendations.

Changes Made over Time

Key informants noted several improvements that have been made to the program over time:

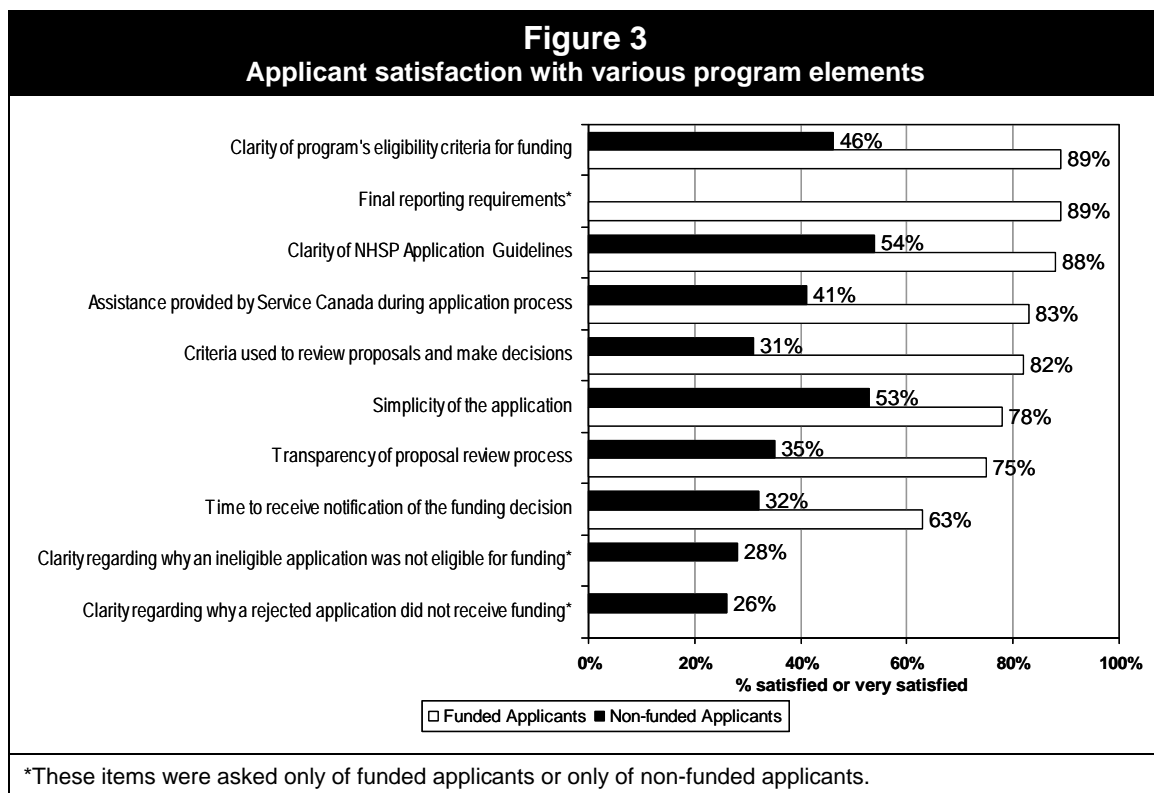

- NHQ has incrementally improved the tools and forms used to deliver the program, so that they are both more user-friendly and provide more useful information for program management. These changes were viewed to have had only positive impacts on the program.
- The budget for the program has increased substantially. This has enabled the program to fund more projects, but the accompanying increase in applications has placed some strain on staff and RRCs.
- Staff and RRCs have become better at promoting the program and making decisions about applications, which has resulted in improved applications and improved use of funding.

- New and increased regional and national priorities have been set each year have contributed to the NHSP being extended to more groups.

Satisfaction with the Program and its Elements

Based on the survey of applicants, 98% of successful applicants who received funding were satisfied with their overall NHSP experience, 97% said they were likely to re-apply in the future, and almost 100% said they would recommend similar organizations to apply for funding. Non-funded applicants were slightly less enthusiastic; 79% said they would recommend similar organizations to apply for funding, and 69% said they would re-apply.

Overall, applicants who received funding were much more satisfied with various program elements than were non-funded applicants. Average satisfaction ratings are shown in Figure 3.

According to the survey of applicants, the elements with which respondents were most satisfied were as follows:

- 89% of funded and 46% of non-funded applicants were satisfied or very satisfied with the clarity of the program's eligibility criteria for funding. Satisfaction with the eligibility criteria increased slightly over time for funded applicants (85% of those funded in 2004/05 vs. 90% of those funded in 2006/07). A similar trend was not seen in non-funded applicants.

- 89% of funded applicants were satisfied or very satisfied with the final reporting requirements.
- 88% of funded and 54% of non-funded applicants were satisfied or very satisfied with the clarity of the NHSP Application Guidelines to prepare the proposal.
- 83% of funded and 41% of non-funded applicants were satisfied or very satisfied with the assistance provided by Service Canada during the application process. Satisfaction with the assistance from Service Canada increased over time for non-funded applicants (38% of non-funded applicants in 2004/05 vs. 47% of non-funded applicants in 2006/07). A similar trend was not seen in funded applicants.
- 82% of funded applicants were satisfied or very satisfied with the criteria used to review the proposal and make a decision. However, only 31% of non-funded applicants were satisfied or very satisfied.
- 78% of funded and 53% of non-funded applicants were satisfied or very satisfied with the simplicity of the application.

Applicants were less satisfied with the following elements of the program:

- 75% of funded and 35% of non-funded applicants were satisfied or very satisfied with the transparency of the proposal review process.
- 63% of funded and 32% of non-funded applicants were satisfied or very satisfied with the time it took to receive notification of the funding decision. Satisfaction with the time it took decreased over time for both funded applicants (74% of those funded in 2004/05 vs. 59% of those funded in 2006/07) and non-funded applicants (38% of those who applied in 2004/05 vs. 30% of those who applied in 2006/07)⁸.
- 28% of applicants whose application was ineligible for funding were satisfied or very satisfied with the level of clarity provided regarding why the organization was not eligible to receive funding.
- 26% of applicants whose application was rejected were satisfied or very satisfied with the level of clarity provided regarding why the organization did not receive funding. Satisfaction with the level of clarity about why the organization did not receive funding decreased over time (46% of those who applied in 2004/05 vs. 29% of those who applied in 2006/07).

When asked why they were satisfied with their experience, about one-third of funded applicants said their satisfaction was due to the results/outcomes of the project and just under a quarter of respondents pointed to the amount of funding as the reason for their satisfaction. One-fifth of the funded applicants said that their satisfaction was related to program staff, particularly the amount of information or help they provided, as well as their speed in providing help. Other elements that contributed to satisfaction for some

⁸ It should be noted that the amount of time required to review applications increased over the three years, from an average of 9 weeks in 2004/05 to 18 weeks in 2006/07.

applicants were the flexibility of the program design and the ease/clarity of the application and reporting processes.

Through the key informant interviews, RRC members were asked if they received sufficient support to carry out their responsibilities. In general, a majority of respondents found the level of support adequate. They highly praised the regional staff for their responsiveness to any questions and concerns.

Suggested Changes

Key informants were asked to suggest changes that would improve the program. The most common suggestions were as follows:

- Lengthen the project time frame beyond one year, so that projects have more time to get started up and accomplish what they set out to do;
- Improve outreach and promotional activities;
- Increase the amount of time for organizations to submit applications, so that there is more time for community engagement;
- Simplify the application process so that it is easier for seniors to submit applications; and
- Decrease the time for processing applications once they are submitted. It should be noted that RRC members indicated that reviewing the applications was a lot of work in a short period of time. It was suggested that the departmental approval process might be streamlined rather than decreasing the review time.

Applicants who responded to the survey also indicated that they would like faster feedback about their applications and a simpler application. Those who had not received funding also wanted clearer explanations of why their application was turned down.

Similar Programs

Key informants were asked to identify other programs with similar target groups or objectives. A majority said there were none in their region that they were aware of, or that there were some programs but that they do not target seniors specifically, and are not comparable to NHSP. The ones that seem to be similar to NHSP include:

- The Positive Aging Fund in Nova Scotia: This program, which started in 2008, is very similar to NHSP in activities (grants based seed funding for new activities), target population (community organizations), goals (which include celebrating seniors, maximizing independence, health and well-being, community participation for Nova Scotia seniors), and criteria (activities consistent with the goals, seniors involved in planning and delivery). The maximum grant size is \$10,000. Organizations receiving grants from both programs may be able to undertake more ambitious projects.

- Du coeur à l'action pour les aînés du Québec / Heartfelt Action for Québec's Seniors (formerly the Engagés dans l'action pour les aînés program). This program is very similar to NHSP in activities (grants based seed funding for new activities), target population (community organizations), goals (which include improved living conditions of Québec seniors, and fostering/highlighting seniors' contribution to Québec's development), and criteria (activities consistent with the goals, especially inter-generational projects and projects that reduce isolation of vulnerable seniors). The maximum grant size is \$30,000. There is considerable coordination between this program and the NHSP in Québec. Organizations receiving grants from both programs may be able to undertake more ambitious projects.
- Age Friendly Initiative of World Health Organization: This program gives \$2,000 to form an age-friendly community. The goal is to contribute to the participation, health, independence, and security of older persons. Separate grants are available in cities and rural/remote communities. It appears that the program is being piloted in Manitoba at the moment. Few details were available about the program, and it is not clear what types of groups are eligible for these grants. The goals appear to be similar to NHSP, but there is likely little overlap between the programs due to the small grant size of the Age Friendly Initiative.
- First Citizens Fund in British Columbia: This program differs from NHSP in that the focus is not on seniors. Its overarching goal is to support the quality of life (including preserving their language and culture) for all First Nations people. However, one component of the program provides partial funding to Elders to offset travel costs related to the Annual Elders Gathering. This gives them an opportunity to share their Aboriginal culture and oral traditions. The value of the grants is not listed on the fund's website. There appears to be little overlap with NHSP.

Summary

- The program is, for the most part, being implemented as intended. Two variations are that Success Stories are not yet being identified in all regions; and the Best Practices report has been replaced with an Annual Learning Forum.
- There is some variance and flexibility in how the program is delivered in each region, which is in line with the NHSP desire to be responsive to unique community needs and circumstances.
- Funded applicants were satisfied with most aspects of the program. They were most satisfied with the eligibility criteria, final reporting requirements, and application guidelines. They were least satisfied with the time taken to receive notification of the funding decision.
- Applicants whose applications were rejected or ineligible for funding were much less satisfied with every aspect of the program. They were most satisfied with the clarity of the application guidelines and the simplicity of the application. However, this was only about half of non-funded applicants in both cases. They were least satisfied with the

clarity of the reasons their application was not awarded funding, and the criteria used to review proposals.

- Suggested changes to program implementation were to lengthen the project time frame to more than one year, improve outreach and promotional activities, and increase the length of time for proposal submission.
- There appears to be relatively little duplication or overlap with other Canadian programs. There are programs similar to NHSP in Québec and Nova Scotia, but not in other provinces and territories. In Québec, there is coordination between the provincial and federal programs.

3.3 Community Engagement

Evaluation Question 3: What efforts have been made to raise the stakeholder community's awareness of the program?

- What kind of outreach was done?
 - How effective was it?
 - What are the barriers, if any?
-

Types of Promotional Activities

NHQ provides support to the region for communications and outreach. It updates information on the NHSP website, where Calls for Applications and examples of successful projects are posted. It also provides a variety of standard communication materials that ensure consistent information about the NHSP is received by stakeholders across the country.

Community engagement and program promotion efforts are primarily the responsibility of regional staff. Table 4 shows the types of promotions and community engagement activities that were identified for each region through key informant interviews and a review of regional documents. There was a combination of planned activities (e.g., scheduled mailouts of application kits) and opportunistic ones (e.g., attendance at trade shows and luncheons), which varied according to regional needs.

Table 4 Communication and Outreach Activities by Region										
Activity	Region									
	BC/ YK	AB/ NWT/ NU	SK	MN	ON	QC	NB	NS	PEI	NL
Newspaper advertisements, public notices, and articles	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓
Mailouts by post or email (e.g., letters, application kits, brochures, DVDs)	✓	✓	✓	✓	✓		✓	✓	✓	✓
Presentations or information sessions to communities or community groups	✓	✓	✓	✓		✓	✓	✓	✓	✓
Information booths at events	✓		✓	✓	✓			✓	✓	✓
Assistance in preparing proposals either one-on-one or through workshops	✓	✓			✓					✓
In-person visits to community organizations/groups and attending meetings	✓	✓	✓		✓		✓		✓	
One-on-one communication by phone, email, or in person	✓	✓	✓	✓					✓	✓
Media interviews or appearances	✓	✓								✓
Inform government officials (municipal, provincial, federal) and encourage them to promote the program					✓			✓		
Putting up posters								✓		
Setting up links to the NHSP website from other organizations' websites			✓							
Source: Key informant interviews and review of regional promotions materials.										

Table 4 shows some potentially underutilized communication methods that regions may wish to consider using, such as media interviews, communications with government officials, and links to the NHSP website from other organizations' websites.

Most of the regions had at least some promotional activities that target specific groups, such as official language minority communities, Aboriginal groups, rural areas, organizations that were rejected in previous rounds, or communities that have not yet received funding.

Adequacy of Promotional Activities

All of the key informants indicated that the outreach activities by regional staff were adequate or somewhat adequate. Based on key informants' responses, the perceived level of awareness of NHSP varies from region to region and within regions, and is not necessarily directly related to the effort of NHSP staff.

Almost all (90%) of funded applicants who were surveyed rated the communications regarding the NHSP as effective or very effective. Of those who did not receive funding, only 56% rated the communications as effective. Those who rated it as ineffective indicated that they would have liked more contact or information and/or clearer information about the requirements.

The amount, sources, and quality of applications received are potential indicators of the effectiveness of the outreach. In theory, if outreach efforts are effective, there should be an increase in applications over time by an increasingly diverse group of organizations, and specific communities of interest should be represented. In addition, as the program eligibility criteria are better understood by organizations, there should be fewer applications deemed ineligible, and a larger proportion of applications should be funded. A review of the data in the CSGC database shows that:

- The number of applications received has remained relatively stable over time: 1,421 in 2004/05, 1,254 in 2005/06, and 1,415 in 2006/07.⁹
- The percent of applications that met the eligibility requirements has increased steadily since the first year of funding: 41% in 2004/05, 65% in 2005/06, and 77% in 2006/07. This trend was evident in most regions.¹⁰
- The NHSP continues to reach new communities each year. Approximately 230 different communities received funding in 2004/05; roughly 300 new communities (i.e., who had not previously received funding) were awarded grants in 2006/07; and 280 new communities received funding in 2006/07.
- The NHSP also reached new organizations over time. Approximately 330 different organizations received funding in 2004/05; 575 new organizations (i.e., who had not previously received funding) were awarded grants in 2006/07; and 630 new organizations received funding in 2006/07.
- Exactly 10% of funded projects were from official language minority communities in each of the years of the program.
- The proportion of applications from rural areas has increased slightly over time (25% in rural areas in 2004/05 to 31% in rural areas in 2006/07).
- The majority (86%) of applications are from local community, charitable, voluntary organizations. A minority are submitted by Aboriginal not-for-profit groups (5%), municipal governments and agencies (2%), provincial non-government organizations (2%), and not-for-profit Band Councils (2%). The proportions have not changed substantially over the three years of the program.

⁹ The number of applications was slightly different in the program's roll-up reports than in the findings from the CSGC. The roll-up reports indicated that there were 1,452 applications in 2004/05, 1,268 in 2005/06, and 1,426 in 2006/07.

¹⁰ The percent of eligible applications was different in the program's roll-up reports than in the findings from the CSGC. The roll-up reports indicated that 54% of applications were eligible 2004/05, 68% in 2005/06, and 76% in 2006/07. Note that the eligibility criteria are minimum criteria for consideration of an application (e.g., that the application is complete, that it is consistent with the program objectives, etc.). These criteria remained relatively consistent over the three years covered by this evaluation, so changes in eligibility rates should reflect improvements in the quality of proposals.

Types of Promotional Activities that are Effective

Key informants thought that outreach efforts were more effective when there was in-person contact (one-on-one or in groups) and assistance was provided with the application.

The survey of funded applicants found that 42% of respondents became aware of the NHSP through program-related awareness packages (including 18% from the website, 11% from a mailed information package, and 7% from a public notice/ newspaper), 24% of organizations first became aware of the NHSP through word of mouth, and 7% heard about it through their MP.

Survey respondents indicated that the best way to inform them of the program in the future would be to send an information package in the mail (mentioned by 58% of funded applicants and 64% of non-funded applicants) or to post the information on the NHSP website (46% of funded applicants and 36% of non-funded applicants). Other methods mentioned by the respondents included:

- Public notice / newspaper (27% of funded and 23% of non-funded applicants)
- Brochure or poster (25% of funded and 20% of non-funded applicants)
- Presentation by an NHSP program officer (20% of funded and 20% of non-funded applicants)
- A partner organization's newsletter (18% of funded and 16% of non-funded applicants)
- Member of Parliament (15% of funded and 15% of non-funded applicants)

The survey of applicants indicated that about three quarters of funded and non-funded applicants had visited the website. Of these, 91% of the funded applicants and 76% of the non-funded applicants rated the website as effective or very effective.

Challenges with Program Promotion

Regional staff noted that geographic distances posed a challenge in getting the word out to rural and remote communities, since travel to distant communities, particularly in the north, is costly.

A key informant in one region noted that they are reluctant to advertise too much because they have had to turn down eligible applicants.

Summary

- A wide range of communications and outreach methods are used by the regions. Most regions use a mix of methods.
- Most funded applicants and key informants indicated that the communications regarding the NHSP was effective. Non-funded applicants were less likely to rate the

communications as effective. They would have liked more contact or information, and/or clearer information about the requirements.

- Key informants thought outreach was most effective when there was in-person contact and assistance with the application.
- Applicants indicated that the best way to inform them of the program was to send an information package in the mail and to post the information on the NHSP website.

3.4 Management Information Systems

Evaluation Question 4: Does the program have adequate management and performance information and administrative data/systems to effectively and efficiently manage the program?

- Are the performance measurement indicators adequate and appropriate?
 - What is the quality of the available performance data?
 - Are the data needed for a summative evaluation being collected?
 - Are there gaps to be filled?
-

Performance Measurement Indicators

Performance indicators are the means by which the NHSP can plan, monitor and assess the achievement of program results. The performance measurement strategy found in the program's Performance Measurement Framework (PMF) describes how the information that is needed to monitor the program effectively will be periodically gathered. This measurement strategy is directly linked to the NHSP's results-based logic model. It includes both its ongoing and its periodic performance measurement activities.

The evaluators carried out an assessment of the adequacy of the performance indicators listed in the PMF. The assessment found that the indicators for outputs are appropriate and informative. Many of the indicators for the program outcomes appear to reflect direct products of the program, and should therefore be considered output indicators rather than outcome indicators. Some examples include:

- Yearly funding priorities established and documented by RRCs;
- # of projects funded, by type of project or by type of activity;
- Total # of communities receiving funding for projects; and
- # of new organizations receiving funding for projects.

In addition, some outcome indicators do not seem to be clearly related to the outcome. Examples include:

- # of participants (estimated) involved in funded projects is not a good indicator for the outcomes: Seniors' Experience, Skills and Wisdom are Utilized and Social Participation, and Inclusion of Seniors. It should be noted that "participants" may be seniors or non-seniors) and the estimate may not reflect what actually occurred.
- Total \$s from funding partners, categorized by type of funding partner does not accurately reflect achievement of the short-term outcome Seniors are connected through networks and partnerships.

There is some overlap amongst the indicators for different levels of outcomes. Logically, long term outcomes should be different from intermediate outcomes, which should, in turn, be different from immediate outcomes, and the indicators should reflect those differences.

Also, several indicators are used multiple times across outcomes at the same level. This is not surprising given that the outcomes overlap with one another. For example, three of the four immediate outcomes refer to increased participation of seniors, and three also refer to partnerships between the funded organization and other partners. A clearer articulation of the outcomes could help to determine the defining features of each, which would simplify the performance indicators. However, in doing so, it would be important to continue to acknowledge the interrelationships among the outcomes.

In the evaluators' opinion, the current indicators are insufficient to capture the complexity of the longer-term outcomes of the program. Looking only at indicator information about the program outcomes, the reader would have a sense of only:

- Documentation of yearly funding priorities
- # projects funded (by type and activity)
- # communities receiving funding
- # participants (estimated) involved in the projects (seniors and in total)
- # of organizations with any funding partners
- # of partners
- # of organizations reporting new partnerships as a result of the funding
- \$ of contributions (in kind or cash) from partners
- # of organizations indicating that the funded activity will continue

Combined, the current indicators do not give a full picture of the intended outcomes of the NHSP, which include increased community capacity to respond to existing or emerging social challenges, increased social participation and inclusion of seniors, seniors engaged in the community, and vibrant and inclusive communities that benefit from the participation of seniors in community life. Additional outcome indicators might relate to:

- The number of funded projects in which seniors are involved in planning or operating the project;
- The organization's continued use of seniors (as leaders, volunteers, etc.) after the end of the funded project;
- Actual networking among seniors within funded projects;
- Partnerships between funded organizations and non-seniors groups;
- The number of seniors involved in any type of activity within the organization (not just funded projects); and
- Inclusion or participation of vulnerable seniors.

Availability and Quality of Data

The NHSP has implemented administrative reporting requirements to ensure efficient and effective management of the program. At the national level, there are two sources of administrative data that can be used for management, monitoring, and evaluation:

- The Common Systems for Grants and Contributions (CSGC) database, which contains basic information about each application, with more complete information about funded projects than non-funded projects. The CSGC is updated by the regional staff when applications are submitted, and throughout the lifecycle of the projects.
- Paper files that are maintained for each application by the regional offices. These files include the application forms, screening forms, assessments, funding decisions, and final project reports, among other documentation. They contain more information about the applications than can be found in the CSGC¹¹, but because the information is not in a database, it is more difficult to compile.

The British Columbia/Yukon, Québec, and Ontario regions have developed databases for their regions to enable them to find information more quickly or easily. At the national level, there are plans to develop a supplementary database that is better tailored to the information needs of the program than is the CSGC.

¹¹ CSGC was developed to capture information related to a wide range of grants and contribution programs, and does not have the flexibility to capture information that is unique to the NHSP. Examples of information from the application forms that is not easily captured in CSGC include: the ways the project meets regional priorities, the difference the project will make to the community, and plans to continue the project beyond the funding. Actual outcomes from the project final reports are also not easily captured in the CSGC.

The accuracy of the CSGC data was assessed by comparing them against the data in a random sample of paper files (10% of applications that were awarded funding and 5% of those that were ineligible or rejected). The completeness of the CSGC data was also assessed, by determining the percent of cases that contained data. In comparing the information in the project files against what was found in the CSGC, the relevant CSGC data were for the most part complete and accurate. However, there were some cases where information in project files was either missing in the CSGC or inputted incorrectly:

- The number of estimated participants was not filled in for all projects. For non-funded projects, this field was completed for only 56% of projects over 3 years.
- The number of seniors was not filled in for many of the projects (33% over three years for funded projects and 25% for non-funded projects over the same time period)¹².
- The approval date in CSGC did not always reflect what was on the paper forms (19% over three years).
- The CSGC had very little information about the decision date for non-funded projects, which makes it difficult to assess the lag time for funding decisions.
- Some applications appeared to have an incorrect project status, i.e., they were classified as rejected in CSGC, when their status should have been ineligible.
- Information about whether an application is from an Official Language Minority Community (OLMC) was not recorded for non-funded projects.
- The amount of funding requested was not recorded for some ineligible projects, especially in the first two years of the program. This makes it hard to calculate total amounts requested.

A random sample of project application files was reviewed, stratified by funding year and application status (ineligible, rejected, and awarded). For the 168 funded applications reviewed, we had final reports from only 57% of the funded projects whose files we reviewed.

Project final reports will be an important source of data for the summative evaluation. From the sample reviewed, it is estimated that final reports were submitted by 88% of the projects funded in 2004/05, 85% of projects funded in 2005/06, and 23% of those funded in 2006/07¹³.

A majority of the regional staff and managers interviewed had no concerns about the accuracy and completeness of the data in the management and information systems. A minority of interviewees had a few concerns, primarily that it is not possible to correct errors in the CSGC retroactively. If an error is serious enough, it requires the program

¹² It should be noted that the number of seniors was not systematically collected on the application forms before 2006/07. This information may have been provided in final reports, but the CSGC does not capture information about the number of participants/seniors after the project has been completed.

¹³ It should be noted that projects funded in 2006/07 may still have been in the process of submitting their reports when this evaluation was conducted. Submission of a final report is strongly encouraged but not mandatory.

staff to recreate the entire record and withdraw the original entry. If the error is minor (such as a typographical error in the name of the organization) it is usually left as is, which makes it more difficult to search the database since searches are sensitive to spelling and punctuation.

Adequacy of Data for Management, Monitoring, and Evaluation

In the key informant interviews, program staff and managers were asked if the information in the administrative data systems was sufficient to inform their work. There were differences of opinion among both staff and managers, with some indicating that they had sufficient data, and others indicating that they did not. Most of the time, staff and managers were able to get the information they needed, but sometimes managers indicated that they received requests for information and reports that could not be produced with the CSGC.

The main issue with the CSGC database is that it was designed for a very different type of program, and is not flexible enough to capture and report the type of information that the NHSP requires. For example, CSGC does not have a field to capture a description of the projects. Staff need to work around this limitation by finding an unused field where they can enter the information, but they are constrained by field length limitations. In other instances, the CSGC requires a response to items that are not applicable to the NHSP, resulting in meaningless data being recorded in the database.

In spite of these issues, there does appear to be adequate administrative data contained in the CSGC, program records, and hard copy files to provide information needed to operate the program and assess outputs, as well as most of the immediate outcomes. The only exception is the number of targeted mailings promoting the program; this does not seem to be tracked consistently. In addition, the estimated number of seniors to be involved in the funded projects was not captured in the application forms from 2004/05 or 2005/06.

Some of the output indicators may be time-consuming to assess because the information will need to be compiled from the paper application forms (e.g., OLMC information about non-funded projects, eligibility status for non-funded projects, and estimated number of seniors/participants in funded projects are not always complete or accurate in the CSGC database).

Likewise, some of the immediate outcomes may be time-consuming to assess because the information is not in the CSGC and will need to be obtained from the project final reports, which are in paper format. In addition, about 15% of funded projects appear to not have submitted final reports in the first two years of funding¹⁴, so an assessment of outcomes based on the final reports may not be completely accurate.

¹⁴ Submission of project final reports is strongly encouraged, but not mandatory.

Because they are submitted shortly after the end of the project, the final reports of funded projects do not provide the information necessary for the assessment of intermediate and long-term outcomes. There does not appear to be any follow-up with funded projects that might provide information about these longer-term outcomes.

Gaps in Data

There are a number of questions not currently being explored through the program administrative data, and that may be answered more appropriately through the upcoming summative evaluation. These include:

- To what extent are seniors' skills and wisdom actually being utilized in the funded projects?
- What contributions are seniors making to the funded organizations (both during and after the project)?
- What contributions are seniors making to vulnerable peers or other groups?
- What contributions are seniors making to community life?
- To what extent is the contribution of seniors valued by community leaders?
- To what extent have seniors developed and enhanced their own social networks?
- To what extent are vulnerable seniors participating more in community activities?
- What new partnerships have been formed between funded organizations and other groups (including non-seniors groups)?
- How have these partnership been sustained?
- What are funded organizations doing to identify emerging social challenges in their communities?
- To what extent are funded organizations and their partners able to launch a more coordinated response to social challenges?

Summary

- The performance indicators for outputs are appropriate and informative.
- The performance indicators for outcomes do not give a full picture of the intended outcomes of the NHSP. Many of the performance indicators reflect outputs rather than outcomes, and several do not seem to be related to the outcome. In some instances, the essence of the outcome is not captured at all. There is also some overlap amongst the indicators for different outcomes.

- The CSGC database contains data that are sufficiently accurate and complete to meet most management needs and to inform the program's performance indicators for outputs. However, some important output data in the CSGC are not complete (e.g., number of participating seniors, OLMC for non-funded projects, amount of funding requested by ineligible projects) and some were not accurate (e.g., project status, approval date) when compared with the paper files.
- The number of targeted mailings promoting the program, which is one output indicator, does not seem to be tracked.
- Some indicators for immediate outcomes will be time-consuming to assess because the information is not captured in the CSGC, and will need to be compiled from the paper application forms. In addition, about 15% of funded projects appear to not have submitted final reports in the first two years of funding, so an assessment of outcomes based on the final reports may not be completely accurate.

3.5 Program Outputs

Evaluation Question 5: To what extent has the program produced its intended outputs?

- What is the profile of projects in each of the regions?
 - What barriers work against achieving the intended outputs?
 - What supports the achievement of the intended outputs?
-

The NHSP intended outputs are:

- Funding priorities are identified by the RRCs;
- Promotions/awareness plans are developed and implemented;
- Projects are funded; and
- Program reports are generated for the previous year to enable ongoing learning.

Funding Priorities

Funding priorities are to be established each year by the RRCs, which are intended to be representative of the diversity of their regions. RRCs (or a Joint Management Committee, in Québec) have been established in each province and territory. RRC membership lists show that the RRCs vary in size, from 4 to 13 members, and generally include a cross-section of representation, including government, seniors, community organizations, and target populations (e.g., specific cultural groups, Official Language Minority Communities). A majority of the NHSP staff and managers and RRC members felt that the RRC representation was either representative or mostly representative of stakeholders and target groups in their region.

Regional priorities for each round of funding have been established and posted on the NHSP website. The priorities vary both from region to region and from year to year. A majority of key informants felt the priorities adequately reflected regional needs.

Promotions/Awareness Plans

Regional staff are intended to raise awareness of the program among targeted geographical communities and communities of interest, and to engage seniors and other volunteers who may not have participated yet in the Program. Each region is intended to develop a promotional plan that outlines the types of activities they will carry out to reach the targeted communities.

Only seven of the regions provided formal promotions and awareness plans for the evaluation to review, but there was evidence of a variety of promotional activities taking place in each of the regions (see Table 4 on p. 23). While all provinces and territories except Québec explicitly indicated that they had sent out targeted mailings to promote the NHSP, the evaluation could not determine the actual number of targeted mailings across all of the regions

The amounts, sources, and quality of applications received are good indicators of the effectiveness of the promotional efforts. These are covered in detail under Evaluation Question 3 and are not repeated here.

Funded Projects

Following the application period, applications are intended to be assessed and recommended or rejected for funding by the RRCs. Approvals are intended to occur through a departmental review process, and approved projects should then be provided with funding. Projects funded by the NHSP should benefit seniors, but they can also utilize seniors' experience, skills and wisdom to address community needs.

Over the three years examined, 4,090 applications were received, and 1,730 of these were approved.¹⁵ As can be seen in Figure 4, both the number and percent of applications approved increased over the first three rounds of funding. This trend was evident in most regions.

¹⁵ There were slight differences between the CSGC data and the program roll-up reports. According to the program roll-up reports, there were 4,146 applications and 1,729 of these were approved.

Figure 4
Status of applications, by year

Source: CSGC

As the number of eligible applications has increased over the years, so too has the length of time required to review and approve the applications. According to the CSGC data, it took an average of about 9 weeks to review and approve funded applications in 2004/05. This increased to about 13 weeks in 2004/05, and to about 18 weeks in 2006/07. The review of paper files suggests it took another 2-4 weeks to send notification of the decision to the applicants.

An indicator for the output of funded projects is the breakdown of projects by theme (active living of seniors, contribution to community, partnership building, or social participation). Project staff have indicated that this indicator is not particularly useful, as most projects address more than one theme, but CSGC requires a single theme to be chosen. The percent of projects identified as addressing each theme is as follows:

- Active living of seniors: 35%;
- Contribution to community: 33%;
- Social Participation: 29%; and
- Partnership Building: 3%.

The review of 10% of the application forms for funded projects found that virtually all of the funded projects were consistent with regional or national priorities, and the vast majority were consistent with both. A majority of the key informants agreed that there was a good match between funding decisions and regional priorities.

The most common types of project activities, as recorded in the CSGC, were inter-generational learning (30%), community capacity building (19%), recreation (19%), networking (17%), outreach (16%), health and social service (13%), and educational (12%).

Previous Year Program Reporting

Previous year program reporting is intended to ensure continuous program improvement as well as accountability. Outputs should include a summary roll-up report for each round of funding, the identification of “Success Stories” to promote the development of similar projects, and final reports submitted by the funded projects.

Annual summary roll-up reports were produced for each of the first three rounds of funding.

“Exemplary projects” have been identified for each region and posted on the NHSP website. According to key informants, the exemplary projects were identified based on project application forms, and are therefore examples of “good ideas” rather than “projects that had the desired outcomes.” It appears that at this point, some regions have gone beyond this to identify “Success Stories” based on the project outcomes as described in the final project reports, and the intent is that all regions will eventually do so. In some regions, staff actively seek out Success Stories, and in one region the Service Canada staff provide a report summarizing the projects and their respective levels of success. This practice varies by region.

Exemplary projects and Success Stories are shared through the following vehicles:

- The regional staff or representatives of funded projects share project examples with prospective applicants (either in person by workshops and community visits, or through newspaper ads, brochures/fact sheets, DVD, word of mouth).
- Exemplary projects are posted on the National website. Applicants are encouraged to look at the website for ideas.
- While Success Stories are beginning to be collected by regional staff in some regions, there does not seem to be a consistent method for distribution of these stories at this point in time.

Barriers and Supports to Achieving the Intended Outputs

Key informants identified very few barriers and supports to the achievement of the intended outputs.

Barriers that were perceived by key informants included stakeholders not working well together, lack of awareness of the program, a lack of understanding of cultural diversity, favouring specific groups or communities over others, and the call for applications being too short. None of these barriers emerged as strong themes among the key informant interviews.

A minority of the key informants identified factors that they thought supported the achievement of the NHSP outputs, including the visibility of NHSP within the community, the available funding, and NHSP staff support. Again, none of these emerged as strong themes among the key informant interviews.

Summary

- Regional Review Committees have been formed that are, for the most part, representative of the diversity of their regions, and RRCs establish regional funding priorities each year.
- Although not all regions have formal promotions and awareness plans, all of the regions except for Québec have sent out targeted mailings to promote the NHSP. All of the regions undertake a variety of promotional activities to engage target communities.
- A total of 1,730 projects were approved in the first three rounds of funding. The approved projects are consistent with the program objectives and regional priorities. The only concern is that, as the number of eligible applications increases, so too does the time required to review and approve the applications.
- A summary roll-up report is produced each year. It is estimated that about 85% of funded projects submit final reports within a year of finishing up their projects. Exemplary projects have been identified and shared with prospective applicants. Some regions have begun to identify Success Stories based on the outcomes described in the project final reports, but not all regions have started this process as yet.

3.6 Short-term Program Outcomes

Evaluation Question 6: To what extent has the program achieved its short-term outcomes?

- What barriers work against achieving the intended outcomes?
 - What supports the achievement of the intended outcomes?
 - Were there any unintended outcomes?
-

The NHSP intended immediate outcomes are:

- Community priorities are addressed;
- Seniors' experience, skills and wisdom are utilized;
- Funded organizations have increased capacity to serve community needs;
- Seniors are connected through networks and partnerships.

Community Priorities are Addressed

Our review of a sample of final reports showed that the most common benefits to the communities were:

- Increased inclusion and decreased isolation for seniors (84%);
- Development of seniors' knowledge/skills (42%);
- Building intergenerational understanding/respect/connections (42%);
- Opportunity for seniors to express selves, share knowledge skills & values (38%);
- Recreation/enjoyment (28%); and
- Promotion of active living, exercise (24%).

Further research is needed to determine the extent to which these benefits are aligned with specific community needs. However, 85% of the funded applicants who were surveyed indicated that their projects contributed somewhat or a lot to enhancing community capacity to respond to existing or emerging challenges, which does suggest that community priorities may be better addressed as a result of the program.

Seniors' Experience, Skills and Wisdom are Utilized

All of the key informants thought that the projects would result in better use of seniors' wisdom, experience and knowledge. They had high praise for intergenerational projects that allowed seniors to share their wisdom with younger generations. They also noted that the sharing of experience and knowledge benefits both the seniors and their community.

One indicator of this outcome identified in the PMF, is the number of participants (estimated) in funded projects. According to the CSGC data, the funded projects expected to have between 0 and 35,000 participants, with a median of 100.

In 2006/07, the program began collecting information about the estimated number of seniors participating in the projects, which is a more precise indicator. Data about the number of seniors were available for almost 70% of the projects funded in that year. The estimates ranged from 2 to 20,000, with a median value of 65.

The survey of funded applicants also asked about the number of seniors participating in the projects. Respondents indicated that 40% of projects had more than 50 seniors participating; 29% of projects had between 21 and 50 seniors participating; and 27% had 20 or fewer seniors participating. One third reported that seniors participated all of the time, and 56% reported that seniors participated most of the time.

Almost all of the project final reports that were reviewed indicated that the project increased the social participation of seniors. The findings from the survey of funded applicants were similar: about 96% of respondents reported that their funded projects contributed somewhat or a lot to increased social participation or empowerment of seniors.

About three-quarters of the final reports that were reviewed indicated that the project reduced the isolation of vulnerable seniors. In the survey, 94% of applicants reported that their funded projects contributed somewhat or a lot to increased inclusion of seniors in the community, or reduced isolation of vulnerable seniors.

In the final reports that were reviewed, a very limited number of projects (35) provided information about the number of seniors involved in planning and organizing funded projects. They ranged from 0 to 649 seniors involved in planning and organizing, with 89% of the 35 projects having at least one senior involved. While these results cannot be generalized to all projects, they do indicate that at least some of the projects have seniors in leadership roles. This tentative finding can be explored further during the upcoming summative evaluation of the program.

Funded Organizations have Increased Capacity to Serve Community Needs

A majority of the key informants felt that the program improved organizations' ability to serve community needs, largely because the program provides seed funding that enables the organizations to enhance the activities they currently offer. They also thought the program helps bring a variety of community members together and increases awareness of seniors' issues. The vast majority of funded applicants who were surveyed (97%) also said that the grants increased their organization's ability to serve the needs of the community, in at least some cases because they were able to enhance their programming. However, the review of a sample of final reports found that slightly less than half of the reports indicated that the project enhanced the organization's opportunities to build their community capacity and partnerships.

Over 90% of projects submitting final reports planned to continue the project activities beyond the end of the funding, which is an indication of continued organizational capacity. Likewise, 83% of survey respondents reported their funded projects had/would continue beyond the end of the funding. Among those few who reported that they did not/would not continue their projects, about half indicated that they did not have enough funds to continue.

Having funding partners is assumed to increase an organization's capacity to serve community needs. Based on the CSGC data, 65% of funded projects had at least one funding partner other than the sponsoring organization. The total cash contributions from all sources was estimated to be \$37.85 million across the three years, which is about one and a quarter times as much as the total amount of grants distributed. The anticipated cash contributions from the sponsoring organizations and their partners averaged about \$21,000 per funded project (about one and a quarter times as much as the average grant size).

The largest cash contributions were expected to be made by sponsoring organizations, followed by non-profit sector organizations and provincial governments. The total anticipated in-kind contributions from all sources was estimated to be \$14.61 million across the three years (an average of about \$8,500 per funded project). The largest in-kind contributions were again expected to be made by sponsoring organizations, followed by non-profit sector organizations and municipal governments. The total

anticipated value of cash and in-kind contributions over the three years was estimated to be \$52.46 million (an average of \$30,000 per funded project). However, it is not known how the estimates compare to the actual cash or in-kind contributions received.

Seniors are Connected Through Networks and Partnerships

A majority of the key informants felt that the funding would improve organizations' networks with their partners, because the organizations – especially smaller organizations – often make their applications with partners. The interviewees also pointed out that NHSP regional staff try to connect organizations if they see benefits in doing so. A minority of the key informants felt that “true partnerships” that lasted beyond the funding were not happening very often, and a minority felt that the program needed to do more work to promote partnerships and networking.

About three quarters of the final reports that were reviewed indicated that the organizations had developed new partnerships through the NHSP-funded project. The number of funding partners listed in the final reports ranged from 1 to 23, with most projects having between 1 and 4 funding partners¹⁶. The most common types of partners were municipal government (38% of projects), other federal government departments (21%), and crown corporations (18%).

In addition to connections among organizations, this outcome covers networks and connections among individual seniors. The review of project final reports found that about half of the reports indicated that the project enhanced the opportunities for networking and association between seniors.

In all, 90% of the survey respondents reported that their funded projects contributed somewhat or a lot to strengthened networks and partnerships between community members, community organizations and government.

Unintended Outcomes

The formative evaluation did not identify any unintended program outcomes. Unintended outcomes should be explored in greater depth in the summative evaluation of the program.

Supports and Barriers to Achieving Outcomes

The most common challenges experienced by projects, according to the survey of applicants and the final reports, were:

- Recruiting staff or volunteers;
- Coordinating projects in light of time constraints and conflicting schedules;

¹⁶ No information is collected in the final reports about the *number* of non-funding partners, although the reports do ask whether or not the project helped the organization develop new partnerships or networks with other organizations in their community, and to list the organizations with which the partnerships will continue.

- Travel costs or transportation;
- Demand for activities outstripping what is available; and
- Language barriers.

In talking about building networks and partnerships among organizations, key informants noted that partnerships were hard work, and were especially challenging in rural areas where the pool of potential partners is limited.

A minority of the key informants felt that the networking that occurs between organizations and community centres, schools, or other organizations supports the achievement of the intended outcomes. The energy generated from seniors working together and feeling valued was also seen as a supporting factor – this provided them with the motivation to continue to contribute.

Summary

- Most participating organizations indicate that they have increased their community capacity to respond to existing or emerging challenges, but conclusive information is not available.
- Both funded applicants and key informants thought that the program was encouraging the use of seniors' experience, skills and wisdom. Most of the projects involve between 30 and 150 seniors, and preliminary evidence shows that seniors are involved in organizing at least some of the projects. Most of those involved in funded projects report that the projects have increased the social participation and inclusion of seniors. Many of the projects also appear to reduce the isolation of vulnerable seniors.
- The program seems to increase many organizations' capacity to serve community needs by enabling them to enhance their programs and services. Most of the funded projects continue beyond the end of the funding.
- About three quarters of the organizations have developed new partnerships through the NHSP-funded projects. Over half of the projects had funding partners other than the sponsoring organization (usually between 1 and 4), which may contribute to the sustainability of the projects.
- A total of \$52.46 million in cash and in-kind contributions were made by the sponsoring organizations and funding partners, including \$37.85 million in cash contributions and \$14.61 million in in-kind contributions.
- About half of the projects seem to have fostered networking and association among seniors.

4. Conclusions

This section highlights the main conclusions regarding the program design and delivery, outreach and promotion, performance measurement strategy, production of outputs and achievement of short-term outcomes for the NHSP.

Program Design

The program appears to be designed in a way that it can realistically attain its stated objectives and outcomes. The anticipated outcomes of the funded projects are consistent with the program outcomes and objectives, which increases the likelihood that the program goals will be achieved. The logic model, while consistent with program documents, needs to be revisited with respect to overlapping outcomes.

Most key informants felt that the program budget was sufficient and that the grant size was adequate. A total of 1,730 projects have been over a three-year period. Over two-thirds of the applications were for less than \$25,000.

The main strengths of the program design identified by key informants included the fact that it was grants-based and the use of Regional Review Committees (RRC) to review applications.

Implementation and Delivery

For the most part, the NHSP is being implemented as intended. Each region has an RRC or equivalent, and there is flexibility in how the program is delivered in each region, reflecting unique community needs and circumstances.

At the national level, there has been ongoing monitoring, and improvements have been made to the program tools and processes over time. At this time, the only elements of the program that have not been carried out as intended are: 1) the identification of Success Stories based on project final reports, which some regions are not doing yet, and 2) the Best Practices report, which has been replaced with an Annual Learning Forum where best practices and program improvements are discussed with all regions.

Funded applicants were satisfied with most aspects of the program, including the eligibility criteria, final reporting requirements and application guidelines. Although non-funded applicants were less satisfied with some aspects of the program, a majority said that they would re-apply, and would recommend to other organizations that they apply for funding.

Those who did not receive funding felt that the program's eligibility criteria lacked clarity and were dissatisfied with both the transparency of the proposal review process and the explanation as to why their organization was not eligible to receive funding. Funded and non-funded applicants both indicated lower levels of satisfaction with the time it took to receive notification of the funding decision.

There appears to be relatively little duplication or overlap with other Canadian programs. There are similar programs at the provincial level in Nova Scotia and Québec, as well as for First Nations groups in British Columbia; but for the most part, the NHSP fills a unique niche in that there are few other grants programs that promote the involvement of seniors in their communities.

Outreach and Promotion

The regional staff have used a wide variety of methods to engage the communities in their regions, including mail-outs of applications kits, presentations to communities or groups, advertisements, and one-on-one communication.

Many survey respondents became aware of the NHSP through program-related awareness packages (the website, mailed information package, and public notice/newspaper). Most respondents indicated that they would prefer future communications about the program through an information package in the mail or to have the information posted on the NHSP website.

Key informants thought that outreach efforts were most effective when there was in-person contact and assistance with the application. Some form of in-person contact is taking place in every region.

The majority of funded and non-funded applicants had visited the NHSP website and both groups felt that it was an effective communications tool.

Performance Measurement and Monitoring

For the most part, NHSP appears to have the necessary management and performance information and the administrative data/systems in place to effectively manage the program. However, the lack of flexibility in the CSGC database means that information for some performance measures have to be collected using a more time-consuming manual process.

While the performance indicators for program outputs are appropriate and informative, the performance indicators for program outcomes do not give a full flavour of the intended outcomes of the NHSP. Many of the outcome indicators reflect direct products of the program or are not clearly related to outcomes. These issues need to be resolved to ensure that there will be appropriate and adequate data for the summative evaluation.

Production of Outputs

Evidence gathered from documents, key informants and administrative data indicate that the NHSP has produced most of its intended outputs. Regional Review Committees have been formed that are, for the most part, representative of the diversity of their regions, and they establish regional funding priorities each year. All of the regions undertake a variety of promotional activities to engage target communities.

The approved projects are consistent with the program objectives and regional priorities. The only concern is that, as the number of eligible applications increases, so too does the time required to review and approve the applications.

A summary roll-up report is produced each year. It is estimated that the majority of funded projects submit final reports within a year of finishing up their projects. Exemplary projects have been identified based on information in the applications, and shared with prospective applicants.

Achievement of Short-Term Outcomes

There is some preliminary evidence that the NHSP is achieving its short-term outcomes. The program encourages the use of seniors' experience, skills and wisdom according to funded applicants and key informants. Most of the projects involved between 30 and 150 seniors, and preliminary evidence shows that seniors are involved in organizing at least some of the projects.

The program seems to increase many organizations' capacity to serve community needs by enabling them to enhance their programs and services. Most of the funded projects continue beyond the end of the funding.

About three-quarters of organizations have developed new partnerships through NHSP-funded projects. More than half of the projects had funding partners other than the sponsoring organization, which may contribute to the sustainability of the projects.

In addition, it was estimated that about \$52 million in cash and in-kind contributions would be made by sponsoring organizations and funding partners. These funds were seen as contributing to organizational capacity and may play a role in projects continuing beyond the funding period.

5. Recommendations

1. Improve the transparency of the decision-making process by providing clear and detailed written explanations for projects that are not awarded funding. Currently, non-funded projects can request a debrief indicating precisely why they were not eligible, or how they ranked in comparison to other projects that received funding. According to program representatives, many non-funded applicants do not pursue this option.
2. Put measures in place to decrease the amount of time required to make decisions regarding funding and streamline the departmental approval process. For example, allowing ongoing submission of applications, with the RRCs reviewing applications four times per year (rather than once per year) might be considered as this would likely reduce the amount required for decisions at any given sitting. It would also put less pressure on organizations to meet deadlines and so could conceivably result in better applications.
3. Review and update the program's performance indicators for outputs, immediate outcomes, intermediate outcomes, and long-term outcomes. Indicators should be directly relevant to the output or outcome, feasible to measure over time, and, cumulatively, should provide sufficient benefit to justify the burden of ongoing measurement.
4. Improve the capture and collation of information about the short-term outcomes of the program. This information is available in the project final reports, but is not captured in a database that can be readily analysed. One possibility would be to adapt the CSGC to capture this type of information.
5. Ensure that CSGC data are complete for any fields that will be used for tracking performance or for the summative evaluation evaluation (e.g., number of participants, number of seniors, approval date, OLMC, amount of funding requested, project status).

Appendix A – Issues Matrix

Evaluation Question	Indicators	Methodologies
<p>1. Is the program designed in such a way that it can realistically attain its stated objectives and anticipated outcomes?</p> <p>Sub-questions:</p> <ul style="list-style-type: none"> • Does the logic model reflect how the program currently operates? • Is the logic model adequately reflecting the program links between the activities and the expected outcomes? • Are resources sufficient? 	<ul style="list-style-type: none"> • Key informant perceptions of the adequacy and appropriateness of: <ul style="list-style-type: none"> ○ Program resources, ○ Program activities, and ○ Program outputs. • Number of applications. • Percent of applications funded. • Type of activities funded. • Range of possible outputs from projects. • Resources available for program delivery. 	<ul style="list-style-type: none"> • Key informant interviews • Document review • Administrative data review • Survey of Applicants
<p>2. Is the NHSP implemented and delivered as intended?</p> <p>Sub-questions:</p> <ul style="list-style-type: none"> • Should changes be made to program delivery to improve its efficiency and effectiveness? 	<ul style="list-style-type: none"> • Key informant perceptions of the advantages and disadvantages of program delivery. • Key informant perceptions of the sufficiency of supports for RRCs. • Improvement areas identified. • Perceived improvements in program processes over time. • Existence of other federal, provincial, or territorial programs that have similar objectives, target groups, and/or activities. 	<ul style="list-style-type: none"> • Key informant interviews • Document review • Administrative data review
<p>3. What efforts have been made to raise the stakeholder community awareness of the Program?</p> <p>Sub-questions:</p> <ul style="list-style-type: none"> • What kind of outreach was done? • How effective was it? • What are the barriers, if any? 	<ul style="list-style-type: none"> • Type and number of promotional activities, by region. • Type and number of organizations reached, by region. • Content of communications, by region. • Number of applications, by region over time. • Types of groups submitting applications, by region. • Percent of applications funded, by region. • Change in number and type of grants from one funding cycle to the next. • Key informant perception about the adequacy and appropriateness of outreach activities by region. • Perceived level of awareness of the NHSP among organizations serving seniors. 	<ul style="list-style-type: none"> • Key informant interviews • Document review • Administrative data review • Survey of Applicants

Evaluation Question	Indicators	Methodologies
<p>4. Does the Program have adequate management and performance information and administrative data/systems to effectively and efficiently manage the program?</p> <p>Sub-Issues:</p> <ul style="list-style-type: none"> • Are the performance measurement indicators adequate and appropriate? • What is the quality of the available performance data? • Is the data needed for a summative evaluation being collected? • Are there gaps to be filled? 	<ul style="list-style-type: none"> • Existence of administrative and information systems. • Accuracy of Administrative System Document. • Content of administrative and information systems. • Existence of performance standards. • Completeness of data in administrative and information systems. • % projects submitting final reports. • Accuracy of data in administrative and information systems. • Staff perceptions of the extent to which available data is sufficient to inform their work. • Managers' perceptions of the extent to which available data is sufficient for management purposes. • Evaluators' perceptions of the extent to which available data is sufficient for evaluative purposes. 	<ul style="list-style-type: none"> • Key informant interviews • Document review • Administrative data review
<p>5. To what extent has the program produced its intended outputs?</p> <p>Sub-issues:</p> <ul style="list-style-type: none"> • What is the profile of projects in each of the regions? • What barriers work against achieving the intended outputs? • What supports the achievement of the intended outputs? 	<ul style="list-style-type: none"> • Formation of RRCs. • Number and composition of RRCs. • Yearly funding priorities established and documented by RRC. • Number of targeted mailings promoting the program. • Number of applications received that reflect communities of interest (i.e., Official Language Minority Communities). • Number of applications received that reflect geographic areas (rural/urban). • Number and percent of applications deemed eligible, National and by region. • Number and percent of eligible projects approved, National and by region. 	<ul style="list-style-type: none"> • Key informant interviews • Document review • Administrative data review • Survey of Applicants

Evaluation Question	Indicators	Methodologies
	<ul style="list-style-type: none"> • Number and percent of projects funded: <ul style="list-style-type: none"> ○ by region ○ by type of project (type = theme) ○ by “activity” (networking, needs assessment, community capacity building, planning, program development. • Consistency between funding decisions and regional/national priorities. • Amount and % of total budget approved, National and by region. • Lag time for application review and fund transfer. • Number and percent of projects submitting final reports. • Annual summary roll-up report produced yearly. • Key informant perceptions of barriers and supports. • Exemplary projects (Success Stories) identified. 	
<p>6. To what extent has the program achieved its immediate outcomes?</p> <p>Sub-issues:</p> <ul style="list-style-type: none"> • What barriers work against achieving the intended outcomes? • What supports the achievement of the intended outcomes? • Were there any unintended outcomes? 	<ul style="list-style-type: none"> • Number of projects, by type and by regional priority addressed. • Number of participants (estimated) involved in funded projects. • Number of seniors involved in funded projects. • Percent of projects, by type of funding partner. • Number and percent of projects with different numbers of funding partners. • Total funding dollars (cash and in-kind) levered from partnering organizations involved with funded projects, not including applicant organizations – all together, and by type of funding partner. • Number and percent of funded projects where the recipient organization had any funding partners (cash or in-kind), not including applicant organizations. 	<ul style="list-style-type: none"> • Key informant interviews • Document Review • Administrative data review • Survey of Applicants

Evaluation Question	Indicators	Methodologies
	<ul style="list-style-type: none"> • Number of organizations indicating (in final project report) that the activity funded by the project will be continued beyond the project funding. • Number and percent of projects where the activity involved “networking”. • Number and percent of organizations that have reported the development of new partnerships/networks because of the completion of the project. • Key informant perceptions of: <ul style="list-style-type: none"> ○ Barriers and supports ○ Immediate outcomes ○ Unintended outcomes.
