Note of appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

Highlights

November estimates of production of principal field crops

- Production of total wheat and canola in the Prairie provinces declined in 2010 compared with 2009, according to the third and final production estimate for 2010. In contrast, farmers in Ontario, Quebec and Manitoba reported a record soybean crop.

Analysis

November estimates of production of principal field crops

Production of total wheat and canola in the Prairie provinces declined in 2010 compared with 2009, according to the third and final production estimate for 2010. In contrast, farmers in Ontario, Quebec and Manitoba reported a record soybean crop.

Farmers in Manitoba and Saskatchewan reported problems with poor grain quality, the result of a slow and wet initial harvest and early frost damage. Yields for wheat and canola were lower than last year. In Alberta, however, farmers reported better than 2009 yields for these same crops.

In Ontario and Quebec very good harvest conditions were reported, with warm and dry conditions generally the rule. As a result, yields were higher than 2009 for soybeans.

Prairie total wheat production down

Total wheat production fell 14.6% to 21.0 million metric tonnes in the Prairies, down 3.6 million metric tonnes from 2009. Reported yield was 40.0 bushels per acre, unchanged from 2009.

Manitoba and Saskatchewan farmers reported significant drops in production of 21.3% and 26.4% respectively, while Alberta farmers experienced a production increase of 9.8%, the result of a strong yield of 46.8 bushels per acre.

Prairie canola production down slightly

Prairie farmers reported that canola production fell 4.6% from 2009 to 11.7 million metric tonnes, the result of a 2.3 bushels per acre decline in yield.

Decreases in production were reported in Manitoba and Saskatchewan, with declines of 21.7% and 16.2% respectively. In contrast, Alberta farmers harvested a record crop of 4.5 million metric tonnes. This was mainly due to a record harvested area of 5.4 million acres, and a strong yield of 36.7 bushels per acre.

Soybean production a record in Ontario, Quebec and Manitoba

Soybean production in Ontario, Quebec and Manitoba rose to highest levels ever, primarily the result of strong yields, and record harvested areas reported in all three provinces.

Ontario soybean production rose 16.4% to 3.0 million metric tonnes, 381,000 metric tonnes above the all-time high set in 2006. A yield of 46.0 bushels per acre, and record harvested area of 2.4 million acres combined to produce this year's peak production.

Quebec farmers reached a new summit of 807,000 metric tonnes of soybeans in 2010, up 52.3% or 277,000 metric tonnes from 2009 and passing the record set in 2008 of 600,000 metric tonnes. This year's robust production was the result of the strongest yield ever attained of 46.0 bushels per acre and record harvested area of 644,900 acres.

Manitoba farmers also reported an all-time high soybean production of 435,400 metric tonnes, surpassing the previous high of 321,100 metric tonnes produced in 2009. A record harvested area of 510,000 acres and a strong yield of 31.4 bushels per acre were responsible for this peak production in the province.

1. Commercial stocks include condominium stocks as of December 2003.

2. Grain exports exclude seed.

3. Animal feed, waste and dockage calculated residually.

4. Some durum wheat is blended with other wheats and exported as wheat excluding durum.

5. May include small amount of use by food plants.

1. Grain exports and imports include seed.

Concepts and definitions

Crop categories

Definitions of the crop categories referenced in Report No. 8, Field Crop Reporting Series are listed below.

Major field crops: wheat, oats, barley, flaxseed, canola, corn for grain and soybeans.

Oilseeds: canola, flaxseed, soybeans and sunflower seed.

Major special crops: dry field peas, lentils, mustard seed, canary seed, sunflower seed, chick peas, dry white beans and coloured dry beans.

Fodder corn and hay

We are asking respondents to report the percentage moisture of their harvested fodder corn and hay for silage. Estimates of production for fodder corn in this publication are calculated using a standard percentage moisture content of 70%. Production of total hay is reported at a standard dry matter content of 90%.

Methodology and data quality

Survey frame and sample selection

Every five years, the Census of Agriculture collects information on agricultural operations across Canada, including institutional farms, community pastures, Indian reserves, etc. The Census of Agriculture provides a list of farms and their crop areas from which a probability sample for the November Farm Survey is selected.

The target population for the November Farm Survey includes all farms in Canada enumerated in the Census of Agriculture except those on Indian reserves and farms from the Northwest Territories, Yukon and Nunavut. Institutional farms are also excluded from the target population.

Probability surveys can use two types of sampling frames; list and area. In the November Farm Survey, only the list frame is used in sample selection. This list frame is stratified into homogenous groups on the basis of Census characteristics (such as farm size and crop area) and sub-provincial geographic boundaries. A sample of approximately 27,600 farms has been drawn from the list frame for the November 2010 Farm Survey.

Data collection

The November Farm Survey was carried out from October 25 to November 12. Data collection is undertaken using the "Computer assisted telephone interview" (CATI) system.

Edit and imputation

With the CATI system, it is possible to implement edit procedures at the time of the interview. Computer programmed edit checks in the CATI system inform interviewers during the interview of possible data errors, which can then be corrected immediately by the interviewer and respondent. CATI significantly reduces the need for subsequent telephone follow-up, thereby reducing respondent burden and survey processing time.

Response rate

Usually by the end of the collection period, 80% of the questionnaires have been fully completed. The refusal rate to the survey is approximately 8 to 9%. The remainder of the sample unaccounted for can be explained by non-contact or non-response. Initial sample weights are adjusted by a process called "raising factor adjustment" in cases of total and partial non-response.

Sampling and non-sampling errors

The statistics contained in this publication are based on a random sample of agricultural operations and, as such, are subject to sampling and non-sampling errors. The overall quality of the estimates depends on the combined effect of these two types of errors.

Sampling errors arise because estimates are derived from sample data and not from the entire population. These errors depend on factors such as sample size, sampling design and the method of estimation. An important feature of probability sampling is that sampling errors can be measured from the sample itself.

Non-sampling errors are errors which are not related to sampling and may occur throughout the survey operation for many reasons. For example, non-response is an important source of non-sampling error. Coverage, differences in

the interpretation of questions, incorrect information from respondents, mistakes in recording, coding and processing of data are other examples of non-sampling errors.

Estimation

The survey data collected are weighted in order to produce unbiased level indicators which are representative of the population. These level indicators then undergo a validation process, based on subject matter analysis and consultation with provincial statisticians, before final estimates are published.

Revisions

The November crop production estimates contained in this publication are final for the crop year. Revisions to these estimates may still be made for up to two years after the end of the crop year.

The following table contains some statistics which indicate the magnitude and direction of the updates between the November production and final revised production estimates. The magnitude is measured by the average percent change between the final and revised estimates. The direction of the update is indicated by counting the number of years that the preliminary estimate is above or below the final estimate. The data indicate, for example, that the estimates of the November production for barley are changed by a magnitude of, on average, 2.6% and usually in a downwards direction.

Text table 1
Magnitude and direction of changes between November and final production estimates, Canada, 1999 to 2009

Crop	Average change	Number of years November production estimates are revised:	
		Upwards	Downwards
	%	number	
Wheat	3.3	3	7
Oats	3.1	4	4
Barley	2.6	2	7
Flaxseed	2.4	1	4
Canola	5.0	5	4
Corn for grain	1.0	4	4
Dry peas	4.3	1	6
Soybeans	0.8	4	4

Data quality

The November crop production estimates are based on level indicators obtained from a probability survey of farming operations. The potential error introduced by sampling can be estimated from the sample itself by using a statistical measure called the “coefficient of variation” (c.v.). Over repeated surveys, 95 times out of 100, the relative difference between a sample estimate and what would have been obtained from an enumeration of all farming operations would be less than twice the coefficient of variation. This range of values is referred to as the “confidence interval”. While published estimates may not exactly equal the level indicators (due to the validation and consultation process), these estimates do remain within the confidence interval of the survey level indicators. For the November Farm Survey, c.v. range from 1% to 5% for the major crops.

For the different types of special crops, the estimates contained in this publication have been assigned a letter to indicate their coefficient of variation (c.v.) expressed as a percentage. The letter grades represent the following c.v. ranges:

Text table 2
Coefficient of variation rating system for special crops

Coefficient of variation range	Grade	Meaning
0.00% to 4.99%	A	Excellent
5.00% to 9.99%	B	Very good
10.00% to 14.99%	C	Good
15.00% to 24.99%	D	Use with caution
25.00% and more	F	Too unreliable to publish

Data confidentiality

Data confidentiality is ensured under the *Statistics Act*, which prohibits the divulging of individual or aggregated data where individuals or businesses might be identified.

Field crop reporting series calendar

Catalogue 22-002-X

The eight reports in this series, which are released at strategic times during the crop year, contain data on stocks of grain and crop area, yield and production. Three reports provide data on stocks of grain at both farm and commercial positions for Canada and the provinces (report nos. 1, 3 and 6). The first report on seeded area (no. 2, in April) contains the seeding intentions of producers, while the June report (no. 4) contains the actual seeded areas of field crops. Yields and levels of production by province are estimated before harvest (report no. 5), during harvest (no. 7) and after harvest (no. 8). Release time for all reports is 08:30 a.m., Eastern time. For further information, please contact Client Services, Agriculture Division, Statistics Canada at 1-800-465-1991 or by email: agriculture@statcan.gc.ca.

Report No. and title

- 1 Stocks of principal field crops at December 31, 2010
- 2 March intentions of principal field crops areas
- 3 Stocks of principal field crops at March 31, 2011
- 4 Preliminary estimates of principal field crops areas
- 5 July 31 estimates of production of principal field crops
- 6 Stocks of principal field crops at July 31, 2011
- 7 September estimates of production of principal field crops
- 8 November estimates of production of principal field crops

Cereals and oilseeds review

Catalogue 22-007-X

This publication provides up-to-date marketing data and analysis for wheat, coarse grains, oilseeds and special crops. Each monthly issue contains producer marketings, exports of grain and grain products, domestic and international supply-disposition tables, oilseed crushing and grain milling data, and cash and future prices. A situation report highlights the month's events.

Some issues contain annual supplementary data. They include the Prices supplement; the Processing supplement; the Methodology and concepts supplement; the Feed grain purchases supplement and the Grain storage & movement supplement.
