## PREFACE

This text is an updated version of a study published under the same title following the 1991 Census. ${ }^{1}$ The text, tables and graphics have been adapted to reflect the new data from the 1996 Census. While seeking to remain true to the initial goal of presenting in a straightforward manner the country's basic demographic reality-certain analyses have been expanded.

The 1871 Census, undertaken a few years after the adoption of the country's Constitution, highlighted the ethnic duality of the population- $61 \%$ of British origin and $31 \%$ of French origin. Eighty years later, following the Second World War, those of French origin still represented $31 \%$ of the population, while the British segment had declined to $48 \%$. The stability of the proportion with French origin was due to their high fertility; the decline in those of British origin was due to the importance of international immigration in demographic growth in the years before and after the First World War. In 1951, 20\% of the population had neither British nor French origins, a considerable increase since 1871 (nearly 8\%)-those of aboriginal origin still represented about one percent of the population. The ethnic diversity of the population has been accentuated over the past half century by the high levels of international immigration and the gap between the fertility rates of the aboriginal population and that of other Canadians.

The growing number of inter-ethnic marriages has diminished the relevance of using statistical categories based on ethnic origin, at least for most of those in the population whose settlement goes back two or more generations. In fact, since the 60 s , linguistic categories have been an increasing attractive and commonly used

[^0]PREFACE
alternative. This is one reason that justifies using demolinguistic statistics to understand the situation of the two major groups in the country. The demolinguistic statistics have also had the advantage of being roughly comparable over the last half-century, which is not so for the statistics on ethnic origin.

Over the years, ethnic duality has given way to the linguistic duality. The two major ethnic groups represented more than $90 \%$ of the population in 1871; in 1996, $90 \%$ of the population speaks French or English most often in the home. However, this permanence masks the very different evolution experienced by English- and French-speaking communities across the country. It is precisely the objective of this text to examine the various factors and implications of this evolution.

Réjean Lachapelle<br>Director, Demography Division<br>Statistics Canada

## INTRODUCTION

In Canada, two large official language groups represent about $83 \%$ of the population. There are also numerous other language groups, none of which represents more than three percent of Canadians. Both geography-5,500 km (3,400 miles) from coast to coast-and history play an important role in understanding the language situation.

Because they live in different parts of the country, many Anglophones have little contact with the French-speaking population and many Francophones would seldom encounter an Anglophone. Francophones are located mostly in Quebec and the neighbouring provinces of New Brunswick and Ontario. Only three percent of Francophones live in other provinces and territories. The location of the French mother tongue population reflects the early settlement of the French in New France and their low propensity to migrate to other provinces.

If we look at Canadians as a whole, we find that the language that most ( $84 \%$ ) of them can speak is English, followed by French which about one-third ( $31 \%$ ) of the population can speak. About one in six Canadians (17\%) speak both official languages, according to the 1996 Census. Those who live in areas where the two language groups are in close proximity have a far greater tendency to speak both English and French. For example, half of the population in the Montreal metropolitan area and $44 \%$ of the population of Ottawa-Hull can speak the two official languages.

The Canadian population also shows a high level of linguistic diversity-20 \% are able to speak a language other than English or French. The fact that almost one in five Canadians can speak a non-official language is largely explained by the high proportion of immigrants in the country. In Canada, $17 \%$ of the population consists
of immigrants, compared to $8 \%$ in the United States. Those able to speak a language other than English or French tend to be concentrated in large urban areas.

How has the language situation evolved in Canada over the last forty-five years? What factors determine the size of language groups in Canada and the tendency of languages to grow or decline? These are two of the principal questions dealt with in this analysis.

Chapter 1 covers the evolution of the English language in Canada between 1951 and 1996, including the size and distribution of the English mother tongue population, the use of English as home language, knowledge of English among the Canadian population as well as the use of English as first official language spoken. While the English mother tongue group grew considerably outside Quebec, the number and percentage of Anglophones in Quebec declined markedly between 1971 and 1996. Fewer than one Quebecer in ten (9\%) reported their mother tongue as English at the time of the 1996 Census.

Chapter 2 examines changes in the French language group and the French language. While the number of Francophones increased considerably since 1951, the proportion of Canadians with French mother tongue declined. Outside Quebec, the proportion declined from $7 \%$ to $5 \%$, though the number increased by 250,000 . Chapter 3 explores the growth and decline of various non-official languages in Canada. Largely influenced by different waves of immigrants coming to the country, the language composition of this population has changed considerably since the 1950s.

Chapter 4 examines the growth in the number and percentage of Canadians who speak both official languages. English Canadians have a greater tendency to speak French than in the past. French Canadians, who have a much greater tendency to speak both languages than their Anglophone counterparts, also experienced growth in bilingualism. Another important topic related to language is also discussed in this chapter: the increase in numbers of Canadians who speak neither English nor French. Chapter 5 analyses the main factors which have contributed to changes in the language situation in Canada. The balance of these factors has changed markedly since 1951, with immigration playing a vital role in the most recent decade.

## THE ENGLISH LANGUAGE

The 1996 Census showed that 24.0 million Canadians could speak English (84\%), 19.3 million spoke English most often at home (68\%) and 17.1 million had English mother tongue ( $60 \%$ ).

## English Mother Tongue

Mother tongue is defined here as the first language a person learned at home in childhood and still understood at the time of the census.

The percentage of the population which had English as its mother tongue (Anglophones) changed very little between 1951 and 1996. Since 1981, the figures have shown a slight decline in the percentage of Anglophones in Canada. Without the heavy immigration to Canada of many people with a language other than English or French as mother tongue, an increase in the proportion of Anglophones would have occurred.

In Quebec, the proportion of Anglophones has declined continuously, dropping from $14 \%$ in 1951 to $9 \%$ in 1996. This has resulted largely from the English mother tongue population leaving Quebec to live in other provinces, particularly during the 1970s.

While the proportion of Anglophones in Canada has changed very little since 1951, the number grew in each decade, more than doubling from 8.3 million in 1951 to 17.1 million in 1996. However, the pattern was very different in Quebec, where there was an increase of about 230,000 in the first two decades, followed by a decline of about 167,000 since then. As a result of this reversal, the net effect was only a slight increase in the number of Quebec Anglophones between 1951 and 1996.

Source: Appendix, table A.1.

Why did the number of Anglophones in Canada more than double between 1951 and 1996? The most rapid growth occurred during the 1950s and 1960s, when women of childbearing age had a much higher level of fertility than those in the two subsequent decades. The English mother tongue group also grew considerably through immigration. Of all the immigrants who settled in Canada between 1991 and 1996 (and who were still in Canada at the time of the 1996 Census), $17 \%$ had English as their mother tongue. In addition, the children of immigrants often learn English as mother tongue.

Between provinces, the percentage of Anglophones varies considerably. New Brunswick has a large proportion in each of the two official language groups ( $65 \%$ Anglophone and 33\% Francophone), while Quebec is largely Francophone with the Anglophone population representing less than $9 \%$. The three most eastern provinces have very high percentages of people whose mother tongue is English (more than $93 \%)$. Ontario and the western provinces, where more immigrants have settled, have larger populations with non-official languages as mother tongue. This accounts for the lower percentages of Anglophones.

Though the number of Anglophones increased in all provinces except Newfoundland and Quebec between 1991 and 1996, the proportion dropped in some provinces. The decline, slight in most cases, was largely attributable to the arrival of immigrants with a mother tongue other than English.

Source: Appendix, table A.1.
Canadians with an English mother tongue make up a very large percentage of the population in all provinces except Quebec and New Brunswick, and in the Northwest Territories. In Quebec, where those with English as their mother tongue comprise $9 \%$ of the population, almost three quarters live in the Montreal census metropolitan area (CMA). In New Brunswick, the English mother tongue population is concentrated in the southern part of the province, while in the Northwest Territories, Anglophones are concentrated in Yellowknife. Inuktitut is the mother tongue of about one third of the people living in the Northwest Territories.

## English Home Language

Home language here refers to the language most often spoken at home at the time of the census.

Since 1971, Statistics Canada has collected data on the home language of Canadians. These data, when combined with the data on mother tongue, provide an indication of the degree to which various languages are growing or declining.

Chart 1.2 Percentage with English Home Language, Canada, Quebec and Canada less Quebec, 1971 and 1996

Source: Appendix, table A.2.
Results from the 1996 Census showed that for Canada as a whole, $68 \%$ of the population speaks English most often at home, compared to $11 \%$ in Quebec. Outside Quebec, almost nine out of ten Canadians speak English most often at home. The percentage of the Canadian population with English as its home language rose slightly, from $67 \%$ to $68 \%$ between 1971 and 1996. However, in Quebec, the proportion of the population with English as its home language declined from 15\% to $11 \%$ over the same period. This decline is largely attributable to Anglophones leaving Quebec in the 1970s and 1980s.

In every province, there are more people with English as their home language than with English as their mother tongue, reflecting a shift toward English by people from other language groups.

THE ENGLISH LANGUAGE
The comparison of 1991 and 1996 data shows that the number of people with English as their home language rose in every province except Newfoundland. The percentage that speak English most often at home increased in New Brunswick, Manitoba, Saskatchewan and the Northwest Territories, while it decreased slightly or remained stable in the other provinces and the Yukon. In Ontario and British Columbia, the more significant decreases in the percentage were a result of immigration by people who speak non-official languages. This affects the proportion speaking English, since it increases the proportion that converses in other languages.

## Knowledge of English

In the census, knowledge of English and/or French was determined by a question about the ability to conduct a conversation in one or both languages. It should be noted that this question measured language knowledge rather than actual use of language.

While about $17 \%$ of the population of Canada speaks both English and French, most Canadians speak only one or the other. Some, mostly immigrants, speak neither of the official languages. The percentage of the population able to speak English grew
between 1951 and 1996 both inside and outside Quebec. In 1996, $98 \%$ of people living outside Quebec and $43 \%$ of Quebecers were able to conduct a conversation in English.

Source: Appendix, table A.3.
Both the number and the percentage of Canadians able to speak English rose between 1991 and 1996. During this five-year period, numbers of English speakers increased in all provinces except Newfoundland (where there was a $3 \%$ decrease in the size of the provincial population), and the percentages able to conduct a conversation in English increased in Prince Edward Island, Newfoundland, New Brunswick, Quebec, Manitoba, Saskatchewan and the Northwest Territories. Declines in percentages of English speakers in the populations of Ontario and British Columbia were largely due to the arrival of new immigrants who were unable to speak English. Despite this decline, the number of English speakers in each of the provinces actually increased. The most significant increase was in Ontario, home of

THE ENGLISH LANGUAGE
43\% of Canada's English-speaking population-where 621,000 English speakers joined the population in the five-year period.

## English first official language spoken

The first official language spoken represents the official language actually spoken which, in most cases, was acquired first. The data on first official language spoken are derived from the responses to the question on the knowledge of official languages, mother tongue and the language spoken in the home. In this way the Canadian population is sub-divided into four categories, English, French, English and French, and neither English nor French.

In 1996, 21.0 million Canadians had English as their first official language spoken. Approximately $91 \%$ of them could conduct a conversation in English but not in French. Nearly all of the rest of sub-population was made up of English-French bilinguals for whom English took precedence over French according to the information provided by the responses to the questions on mother tongue and language spoken in the home.

Persons having English as their first official language spoken represented $74 \%$ of the Canadian population. Outside Quebec, they represented more than $90 \%$ of the population in every province and territory except New Brunswick where they represented two-thirds of the population. In Quebec, English was the first official language spoken of $13 \%$ of the population.

In every province and territory the number of persons with English as their first official language spoken was greater than the number having this language as their mother tongue. Even in Quebec, where English is the minority official language, the same trend existed given the attraction of English among Allophones.

The number of persons with English as their first official language exceed the number which used this language most often in the home except in the Maritime provinces. In these three provinces, where there are few Allophones, Francophones accounted for most transfers towards English (language spoken most often in the home). These people have by definition French as their first official language since in deriving this variable mother tongue takes precedence over the language spoken most often in the home.

[^1]1. Those in the English/French category have been allocated equally to the English category and the French category in order to improve the comparability of the data relating to mother tongue and home language.

## THE FRENCH LANGUAGE

The 1996 Census showed that 8.9 million Canadians could conduct a conversation in French ( $31 \%$ ), 6.4 million spoke French most often at home ( $23 \%$ ) and 6.7 million had French as their mother tongue (24\%).

## French Mother Tongue

Although the number of people with French as their mother tongue (Francophones) has continued to increase in Canada, their proportion has declined over the last forty-five years. Between 1951 and 1996, the number of Francophones rose from 4.1 million to 6.7 million, but the proportion of Francophones in the population fell from $29 \%$ to $24 \%$.

The proportional decline is largely explained by the heavy immigration of people whose mother tongue was a language other than French. For example, of the 1,039,000 immigrants enumerated in the 1996 Census as having arrived in Canada over the previous five years, only $3 \%$ had French as a mother tongue.

In the past, the high fertility rate of Francophone women in Canada offset the impact of immigration from other countries on the distribution of language groups. With a fertility higher than that of Anglophones, Francophones made up a steady $30 \%$ or so of the Canadian population for many years. Since the 1960s, though, the fertility rate of Francophone Canadian women has declined, so much so that their fertility level has become lower than that of Anglophone Canadian women since the seventies.

Outside Quebec, children of parents with a French mother tongue sometimes learn English rather than French in early childhood. The transmission of French mother tongue is not assured, particularly when one of the parents has English as a mother tongue. The size and proportion of the Francophone population are affected by this phenomenon.

Chart 2.1 Percentage with French Mother Tongue, Canada, Quebec and Canada less Quebec, 1951-1996

Source: Appendix, table A.1.
Quebec is the only province in which the majority of the population has French as its mother tongue. In 1996, $86 \%$ of Francophones in Canada lived in Quebec. They accounted for $82 \%$ of the Quebec population. Although their number rose from 3.3 million in 1951 to 5.7 million in 1996, their proportion changed very little during that time. After decreasing between 1951 and 1971 due to both the decrease in the fertility of Francophone women and heavy immigration, the proportion of Francophones has reverted to the 1951 level since the 1980s. The proportion of Francophones rose as Anglophones left Quebec and moved to other provinces.

Outside Quebec, the Francophone population grew by 250,000 between 1951 and 1996, but the proportion of Francophones continuously declined.

Source: Appendix, table A.1.
The situation of Francophones varies widely from province to province. Quebec is the province with the highest proportion of persons whose mother tongue is French, followed by New Brunswick. It is in the latter province and in Ontario that more than three quarters ( $76 \%$ ) of Francophones living outside Quebec are found. Since its entry into Confederation in 1949, Newfoundland's provincial population has always had the smallest proportion and lowest number of Francophones.

Between 1991 and 1996, the population with French as its mother tongue and the proportion of the Canadian population made up by that group has fallen in all provinces, except Quebec and British Columbia. In these two provinces, the number of Francophones has grown while their proportion has decreased. Only in the Yukon has both the number and the proportion of Francophones in the population increased.

## French Home Language

The number of Canadians who speak French most often at home is growing: there were 6.4 million in 1996, compared with 5.5 million in 1971. However, the relative importance of French home language in the country as a whole has decreased, falling from $26 \%$ in 1971 to $23 \%$ in 1996. In Quebec, the number and proportion of persons with French as a home language increased between 1971 and 1996, while the situation was the reverse in the rest of Canada.

THE FRENCH LANGUAGE

Chart 2.2 Percentage with French Home Language, Canada, Quebec, Canada less Quebec, 1971 and 1996

Source: Appendix, table A.2.
In all provinces and territories except Quebec, the number of persons with French as a mother tongue was greater than the number of persons with French as a home language. Thus, in the provinces of Saskatchewan, Alberta and British Columbia, more than three times as many people reported having French as a mother tongue than reported French as a home language in 1996. In Newfoundland, Manitoba, and the territories, less than half of the Francophones spoke French most often at home. In the other provinces, the fraction speaking French most often at home was higher. It is really only in New Brunswick that the vast majority of Francophones seem to retain their mother tongue as their home language. In $1996,33 \%$ of the population of New Brunswick had French as a mother tongue and 30\% had French as a home language. These persons lived mainly in the northern and eastern parts of the province.

In Quebec, French, the mother tongue of the majority, is likely to be spoken most often at home by Francophones, but also by certain persons in other language groups. Thus, in 1996 the proportion of Quebecers who spoke French most often at home ( $83 \%$ ) was larger than that of Quebecers who reported French as mother tongue ( $82 \%$ ).

Comparing the situation for French as a home language in 1991 and 1996 reveals a decrease in the number and proportion of people with French as a home language in almost all provinces and territories. Only the Yukon showed an increase in both; Quebec and British Columbia registered an increase in the number only.

## Knowledge of French

Despite the decline in the proportion of persons with French as a mother tongue or home language, the proportion of French speakers remained fairly stable (around $32 \%$ ) between 1951 and 1996. The number of persons able to conduct a conversation in French nearly doubled during this period, rising from 4.5 million to 8.9 million. In Quebec, as well as in the other provinces and territories, except Saskatchewan, the proportion and number of persons in the population who know French has grown continuously since 1961.

THE FRENCH LANGUAGE

Source: Appendix, table A.3.
Persons who know French are concentrated in Quebec. In 1996, some $75 \%$ of them lived in that province. However, since 1961 the concentration has declined. The decline is attributed to the increase in bilingualism among non-Francophones and has occurred despite the marked increase in the number of French speakers in the Quebec population. Over twenty-five years - that is, between 1971 and 1996 - the proportion of the population outside Quebec able to speak French among people with a mother tongue other than French rose from $4 \%$ to $7 \%$. The popularity of secondlanguage programmes (immersion or regular courses) in English-language schools has contributed to this increase.

In all provinces, except Saskatchewan, an increase was observed in the number and proportion of persons able to conduct a conversation in French between 1991 and 1996.

## French First Official Language Spoken

In 1996, 7.0 million Canadians had French as their first official language spoken. Approximately 58\% could conduct a conversation in French, but not in English. Nearly all of the rest of this sub-population was made up of English-French bilinguals for whom French took precedence over English according to the information provided by the responses to the questions on mother tongue and language spoken in the home.

Persons with French as their first official language represented 25\% of the Canadian population. In Quebec, where French is the mother tongue of the majority, it represented $86 \%$ of the population. In the other provinces and territories less than $5 \%$ of the population had French as their first official language, except in New Brunswick where the proportion reached $33 \%$.

THE FRENCH LANGUAGE
When French is spoken as a minority language the number of those with French as a first official language spoken is much closer to that of mother tongue than home language, which is always weaker. Furthermore, the number of persons with French as a mother tongue is generally slightly higher than the number with French as first official language spoken, since it excludes persons with French as a mother tongue but who are unable to conduct a conversation in their first language learned. This phenomenon is however counterbalanced in Ontario by Allophones with French as their first official language. The observed difference which favours first official language spoken is also explained by the decision to allocate half of the French and English category, which is made up principally of English-French bilinguals who have a non-official language as mother tongue and home language.

In Quebec, the number of persons with French as first official language spoken is much greater that those with French as mother tongue or those with French as home language. This is due to the large number of mother tongue and home language Allophones who are able to conduct a conversation in French but not in English.

[^2]1. Those in the English/French category have been allocated equally to the English category and the French category in order to improve the comparability of the data relating to mother tongue and home language.

## THE NON-OFFICIAL LANGUAGES

The presence of languages other than English or French in Canada reflects the ethnic and linguistic diversity that characterizes the nation. The 1996 Census showed that 5.8 million people ( $20 \%$ ) could speak at least one language other than English or French, some 2.8 million ( $10 \%$ ) spoke a non-official language most often at home and 4.7 million ( $17 \%$ ) had a non-official language as mother tongue.

## Mother Tongues Other than English or French

The percentage of the population with a non-official language as mother tongue rose between 1951 and 1996, largely because of an increase in the number of immigrants during this period, coupled with an increase in the tendency of immigrants to come from countries where languages other than English or French are spoken.

In Canada, the percentage of the population with a non-officiallanguage as mother tongue rose from $12 \%$ in 1951 to $17 \%$ in 1996. Outside Quebec, people with a nonofficial language as mother tongue represented $19 \%$ of the population in 1996, up from $15 \%$ in 1951. In Quebec, the presence of non-official languages changed considerably over this period, rising from $4 \%$ of the population in 1951 to $10 \%$ in 1996.

The number of Allophones (people with a language other than English or French as mother tongue) in Canada rose considerably between 1951 and 1996. From 1.7 million in 1951, the number has grown continually since then. This was most notable during the 1950s when a large number of immigrants from European countries made their way to Canada; over the last fifteen years,

| 1971 | $2,808.2$ | 13.0 | 372.5 | 6.2 | $2,435.6$ | 15.7 |
| 1981 | $3,120.9$ | 13.0 | 421.3 | 6.6 | $2,699.6$ | 15.2 |
| 1991 | $4,120.8$ | 15.3 | 598.5 | 8.8 | $3,522.3$ | 17.5 |
| 1996 | $4,744.1$ | 16.6 | 681.8 | 9.7 | $4,062.3$ | 18.9 |

Source: Appendix, table A.1.
immigration from Asia and the Caribbean has been a major catalyst for linguistic diversity. In Quebec, the number of people with a non-official language as mother
tongue rose from 150,000 to 682,000 between 1951 and 1996. Outside Quebec, the number rose from 1.5 million to 4.1 million over the same period.

Between 1991 and 1996, the number of people with a non-official language as mother tongue rose in every province except Manitoba and Saskatchewan. The largest increase was in Ontario, where the number of people with a mother tongue other than English or French rose by 335,000 , to represent $22 \%$ of the population ( 2.4 million people). Much of the increase resulted from the arrival of new immigrants in Toronto. In terms of average annual growth, the number of Allophones grew over the last five years by 67,000 compared to 57,000 during the 1981-91 period. However, in British Columbia-particularly Vancouver-the average annual growth was even greater: 38,000 over the last five years compared to 19,000 in the 1981 to 1991 period. Over the last five years the number of persons with a mother tongue other than French or English grew by the same number as it did during the entire 1981-1991 decade (190,000).

The percentage of the population with a non-official language as mother tongue declined in Manitoba and Saskatchewan, where German and Ukrainian groups have formed the bulk of non-official language groups in the past. Conversely, the percentage has increased in provinces that have received more recent immigrants, particularly in Ontario, Quebec and British Columbia.

Interestingly, those with a non-official language as mother tongue form only a very small percentage of the population in the eastern provinces. In fact, only a small percentage of immigrants to Canada take up residence east of Montreal. The location of people with a non-official language as mother tongue is largely a reflection of regional trends in terms of immigration.

Quebec has only a small percentage of its population (10\% in 1996), with a nonofficial language as mother tongue compared with other large provinces. This reflects the traditional pattern of a disproportionate number of immigrants settling outside Quebec. While almost a quarter of Canada's population is located in Quebec, only $13 \%$ of immigrants are living there, according to the 1996 Census.

The percentage of the population with a mother tongue other than English or French varies considerably from one census metropolitan area (CMA) to another; of Canada's 25 CMAs, Toronto had the largest proportion (37\%), followed by Vancouver (34\%) and Montreal (18\%). Almost $60 \%$ of the population that reported having a non-official language as mother tongue lived in Toronto, Vancouver or Montreal.

Source: 1996 Census of Canada.
The sizes of language groups other than English or French reflect the most recent immigration trends. The ranking of the non-official languages reported most frequently as mother tongue in Canada have changed considerably over the years. In 1971, German was the most frequently reported non-official mother tongue among Canadians $(559,000)$, with those reporting Italian as a close second $(539,000)$. The German mother tongue group has since declined in numbers to 491,000 people in 1991 and to 471,000 in 1996, now only third in the list of languages. Over the same period, the Ukrainian mother tongue group has recorded the largest decrease in numbers (a $44 \%$ decrease), slipping from third in 1971 to eighth twenty-five years
later. In 1996, $47 \%$ of people with Ukrainian mother tongue were aged 65 and over, compared to $12 \%$ for the overall Canadian population.

The Italian mother tongue group, which recorded a large increase between 1951 and 1971(from 92,000 to 539,000 ) due to considerable immigration from Italy, has been declining ever since, to 514,000 in 1996. In contrast, the Chinese mother tongue group has been experiencing rapid growth in the last fifteen years, due to increased immigration during this period. Between 1991 and 1996, the number of people who reported Chinese as mother tongue increased $42 \%$ to 736,000 , while during the twenty years before that five-year period, their number had grown in a fashion similar to the Italian group between 1951 and 1971. However, if the average annual growth of the two language groups during these twenty year periods was about the same(more than 21,000 ), there has been a remarkable average annual growth of the Chinese language group over the last five years. While the census metropolitan regions of Toronto and Vancouver accounted for $87 \%$ of all mother tongue Chinese persons during this five year period and they both experienced an average annual growth of about 18,000 persons from this group. Proportionately Vancouver experienced a greater increase. The percentage increase in this group was $65 \%$, compared to $43 \%$ in Toronto.

Other language groups that appear on the list of the largest Allophone groups in 1996 have also grown because of immigration. Thus, the Spanish, Portuguese, Punjabi, Arabic and Tagalog groups grew considerably in the twenty-five-year period leading up to 1996. Between 1991 and 1996 alone, the number of people who reported Punjabi, Arabic, Tagalog and Spanish as their mother tongue increased $46 \%, 39 \%$, $36 \%$ and $22 \%$ respectively, while those reporting Portuguese increased only $1 \%$. The Polish group, which has also increased its numbers markedly from 1971 to 1991 (a $47 \%$ increase), principally due to immigration during the 1980s, recorded a slowdown of its growth over the last five-year period, to $11 \%$.

## Aboriginal Languages

The aboriginal languages have been spoken in Canada for a long time. Because of the concentration of various aboriginal groups in particular parts of the country, their presence is much more apparent in some provinces than in others. Cree is by far the most frequently reported mother tongue among the aboriginal languages $(88,000)$, followed by Inuktitut $(28,000)$, and Ojibway $(26,000)$

Except for people with Micmac mother tongue in Nova Scotia and New Brunswick, there are few aboriginal languages reported as mother tongue in the Atlantic provinces. Nova Scotia has the highest number, with 4,200 people reporting an aboriginal mother tongue. Those with an aboriginal language as mother tongue account for a sizeable proportion of the non-official languages in both Manitoba $(17 \%)$ and Saskatchewan (25\%). People with Cree as mother tongue are located in all provinces from Quebec to British Columbia, but are heavily concentrated in

THE NON-OFFICIAL LANGUAGES
Manitoba and Saskatchewan ( $58 \%$ ). The Ojibway mother tongue population is largely found in Ontario and Manitoba (89\%), while $97 \%$ of those with Inuktitut as mother tongue live in the Northwest Territories or Quebec.

## Home Language Other than English or French

The number of people who speak a non-official language most often at home is growing in Canada, from 1.6 million in 1971 to 2.8 million in 1996. The proportion of the population with a non-official home language has also increased over this period, from $7 \%$ to $10 \%$. This holds true for Quebec as well as for the other provinces and territories combined.

[^4]

Chart 3.3 Percentage of the Population with Home Language Other than English or French, Canada, Quebec and Canada less Quebec, 1971 and 1996

Source: Appendix Table A.2.
The population that uses a non-official language most often at home ( 2.8 million people) is considerably smaller than the population that has a non-official language as mother tongue ( 4.7 million people). Many Canadians with a non-official language as mother tongue use English or French most often at home. Nevertheless, 10\% of Canadians reported a non-official language as their home language in 1996, up from $7 \%$ in 1971, due to immigration. The majority of those who spoke a non-official language most often at home were living in Ontario ( $52 \%$ ), British Columbia ( $17 \%$ ), Quebec (16\%) or Alberta (8\%).

Given the ability of the three largest census metropolitan regions in Canada(Toronto, Vancouver and Montreal) to attract immigrants, it is to be expected that these regions will experience the greatest increase in the proportion of persons speaking a language other than English or French in the home. In 1996, Toronto had the highest proportion of persons speaking a non-official language in the home ( $25 \%$ ), followed by Vancouver (22\%) and Montreal (12\%).

## KNOWLEDGE OF NON-OFFICIAL LANGUAGES

The 1991 Census was the first to ask Canadians whether they could speak a language other than English or French. In 1996, the most common non-official languages spoken were Chinese $(791,000)$, Italian $(694,000)$, German $(654,000)$ and Spanish $(506,000)$. Many Canadians have learned a non-official language as their mother tongue. Others have acquired one or more non-official languages as second languages. Other than English or French, Spanish was the most frequently acquired second language. It was estimated that some 277,000 people could speak Spanish as a second language in 1996. German (183,000 people) and Italian (180,000 people) were the two other non-official languages most often learned as second languages. Of those who reported the ability to conduct a conversation in one or more of these three non-official languages, English or French was the mother tongue of $44 \%$ of those able to speak Spanish, $23 \%$ of those able to speak German and $23 \%$ of those able to speak Italian.

At the provincial level, Italian is the most commonly known non-official language in Quebec $(193,000)$, followed by $\operatorname{Spanish}(191,000)$ and $\operatorname{Arabic}(92,000)$. Italian is also the most commonly know non-official language in Ontario $(427,000)$, followed by Chinese $(361,000)$ and German $(250,000)$. These later two languages were also the most commonly spoken non-official languages in British Columbia: 277,000 spoke Chinese and 123,000 spoke German.

Knowledge of German is quite wide spread in the provinces to the East of Quebec as well as in the Prairie provinces. With the exception of Prince Edward Island and Alberta, a substantial number of speakers of Aboriginal languages are also

[^5]THE NON-OFFICIAL LANGUAGES
present-specifically, Montagnais-Naskapi in Newfoundland, Micmac in Nova Scotia and New Brunswick and Cree in Manitoba and Saskatchewan. Aboriginal languages were also wide spread in the Northwest Territories(principally Inuktitut) and the Yukon (the Athapaskan languages).

## THE KNOWLEDGE OF OFFICIAL LANGUAGES

English and French, the two official languages of Canada, are the principal languages that the great majority of Canadians use to communicate. In 1996, $67 \%$ of Canada's population was able to conduct a conversation in English only, $14 \%$ in French only and $17 \%$ in both of these languages. Around $2 \%$ of people enumerated reported not knowing either of these two languages.

## English-French Bilingualism

English-French bilingualism rose markedly in Canada between 1951 and 1996. The number of bilingual Canadians more than doubled during that period, rising from 1.7 million to 4.8 million, while their proportion rose from $12 \%$ to $17 \%$.

In 1996, the rate of English-French bilingualism was highest in Quebec (38\%) and New Brunswick ( $33 \%$ ). In all other provinces and territories, bilingualism was considerably lower than the national rate of $17 \%$.

However, the rate of bilingualism increased nearly everywhere in the country in the five-year period before the last census. Between 1991 and 1996, the proportion of the population that was bilingual grew in all provinces and territories, except Saskatchewan where it remained constant.

THE KNOWLEDGE OF OFFICIAL LANGUAGES

Chart 4.1 English-French Bilingualism, Canada, Quebec and Canada less Quebec, 1951-1996

Source: Appendix Table A.3.
The majority of bilingual persons live in Quebec, Ontario, British Columbia and New Brunswick. In 1996, some $90 \%$ of all bilingual persons in Canada lived in these four provinces. More than half (55\%) were in Quebec, with the largest concentration in the Montreal census metropolitan area. In Ontario and New Brunswick, it is mainly in the municipalities bordering Quebec that one finds large proportions of bilingual persons. The proximity of the two officiallanguage groups is a major reason for the high rate of bilingualism in these areas. In British Columbia, more than half of bilingual persons lived in the Vancouver census metropolitan area.

The percentage of bilingual persons differs considerably from one CMA to another. Montreal has the highest rate with half of its population being bilingual. It is followed by Ottawa-Hull (44\%), where there was a marked difference between the Quebec part ( $62 \%$ ) and the Ontario part ( $38 \%$ ). In general, the census metropolitan areas in Quebec have a higher percentage of bilingual people. Outside Quebec, Sudbury was the CMA with the highest rate of bilingualism (40\%). St. John's (Newfoundland) has the lowest proportion of bilingual people (5\%) of any CMA. The rate of bilingualism increased in most census metropolitan areas between 1991 and 1996.

Source: Calculated from Appendix Table A.3.
The rate of bilingualism for language groups varies depending on where they live: minority language groups have a higher bilingualism rate than the majority. Nationally, at $41 \%$, the rate of bilingualism among Francophones was almost five times greater than that among Anglophones (9\%). Conversely, in Quebec the English mother tongue minority has the higher rate of bilingualism. Canadians with French as a mother tongue living outside Quebec have a much higher rate of bilingualism than do those with English as a mother tongue.

The rate of bilingualism among persons with a mother tongue other than English and French remained stable in the 1991 to 1996 period. Nearly $47 \%$ of Allophones living in Quebec were bilingual, a rate almost nine times higher than that of Allophones living in the other provinces and territories.

The rate of bilingualism also varies considerably by age group for Anglophones and Francophones. The difference reflects the two populations' differing ways of learning a second language. In the case of Francophones in Quebec, the rate reaches a peak at ages that correspond to high labour force participation. Thus, the rate is highest ( $48 \%$ ) for the 20-24 age group, and stays high at subsequent ages.

For Anglophones outside Quebec, the rate of bilingualism is highest at ages corresponding to the school years. It reaches a maximum (16\%) for the 15-19 age group, and declines thereafter. The lower rates in older age groups are explained, especially, by the lesser popularity or the non-existence of French immersion programmes during their school years. In the case of most recent cohorts, from kindergarten on, children could register for a French immersion programme or take French courses. Since 1971, a growing number of English schools have been providing French immersion programmes and the number of students who are registered in them has grown continuously over the years. In other words, Anglophones outside Quebec learn French as a second language mainly at school.

In Canada, between 1981 and 1996, the number of elementary or secondary students enrolled in French immersion rose from 65,000 to 273,000 , and the proportion rose from $2 \%$ to $7 \%$ of eligible school enrolment. Ontario accounted for more than half (55\%) of all students enrolled in French immersion, while New Brunswick had the highest proportion of their students in such programmes.

[^6]In the case of Francophones in Quebec, English immersion programmes are virtually non-existent. In the regular programme, English courses are mandatory from grade four of primary school. Without a doubt, job market requirements play an important role in learning English as a second language. Between 1971 and 1996, participation in the labour force increased considerably for Quebec's population, rising from 53\% to $64 \%$ as a result of the increased presence of women in the labour force. This change has likely played a role in the advance of bilingualism, since nearly half of the labour force in that province is bilingual. In 1996, some $47 \%$ of the female population in the labour force in Quebec was bilingual, compared to $38 \%$ in 1971. This increase was greater than that in the male population, where the percentage of bilingual people rose from $46 \%$ to $52 \%$.

## Population Unable to Speak English or French

During the first half of the 1990s, the number of people in Canada who were unable to speak English or French has continued to increase. According to the 1996 Census, a total of 473,000 residents ( $2 \%$ ) spoke neither official language. These included young children who could not speak any language at all, but even excluding children under five years old, there remained 386,000 people who could not speak English or French.

[^7]THE KNOWLEDGE OF OFFICIAL LANGUAGES
Most of the people who are unable to speak English or French live in Ontario, British Columbia, Quebec and Alberta. These provinces have been popular choices of residence for many recent immigrants: a group in which many people speak neither English nor French. Other provinces and territories have far fewer people with this language difficulty, ranging from approximately 9,000 in Manitoba to fewer than 50 each in Prince Edward Island and the Yukon.

In 1996, most of the people who were unable to speak an official language lived in large urban areas. Toronto, a city in which more than $40 \%$ of the population was born outside Canada, led the way with 164,000 , followed by Vancouver $(72,000)$ and Montreal $(47,000)$. Edmonton and Calgary, the two major metropolitan areas in Alberta, were each home to about 12,000 people unable to speak either English or French.

In the first half of the 1990s, the number of people unable to speak English or French increased considerably in British Columbia and Ontario, and in the largest urban centres. In Toronto, for example, the number of people who spoke neither official language rose from 124,000 in 1991 to 164,000 in 1996, while in Vancouver their number was more than one and a half that of 1991. Calgary also experienced a considerable increase in this population, while smaller but significant increases were observed Montreal. Such increases have considerable implications for social services (for example, language training) which are needed to integrate this population into Canadian society.

People with Chinese, Italian or Portuguese as their mother tongues together account for more than half ( $55 \%$ ) of all those unable to speak English or French in Canada. Chinese, the fastest-growing language group during the five years before the 1996 Census, was the mother tongue of 135,000 of these people, followed by Italian $(45,000)$ and Portuguese $(30,000)$.

In most of the language groups, $60 \%$ of those unable to speak an official language were women. The lower labour force participation of women is one reason for the difference in language abilities between the sexes. Men's higher labour force participation exposes them to the official languages at work and may also mean that they have better access to language training programmes in their work environment.

## FACTORS AFFECTING THE EVOLUTION OF LANGUAGE GROUPS

The evolution of the size of language groups in Canada is principally the result of factors such as fertility, international migration (immigration and emigration) and also, at the provincial level, interprovincial migration. Another factor which influences the size of these groups is the parent to child transmission of the mother tongue. Since this transmission of the language is strongly influenced by whether the couple is endogamous or exogamous (based on whether both members of a couple have the same mother tongue) and by the language that is spoken most often in the home, an analysis of the evolution of the size of language groups must take into account phenomena such as exogamy and language transfers.

The most significant changes that occurred from 1951 to 1996 in the size and proportion of each language group can be summarized as follows:

## English Language Group

## Canada

<Considerable average annual growth during the forty-five-year period, particularly during the 1950s and 1960s ( $2.9 \%$ and $2.2 \%$, respectively).
<Smaller, but substantial, average annual increases in the 1970s, 1980s and the first half of the 1990s ( $1.4 \%, 1.0 \%$ and $0.9 \%$, respectively).
<A slight increase in the percentage of Anglophones in Canada's population, from $59 \%$ in 1951 to $60 \%$ in 1996.

## Quebec

<Average annual growth in the Anglophone population during the first two decades of the period considered ( $2.5 \%$ and $1.3 \%$, respectively).
<Average annual declines in the Anglophone population in both of the following decades; 1.2 \% during the 1970s and $1.0 \%$ during the 1980s. The average annual decline between 1991 and 1996 (slightly over $1 / 10$ of $1 \%$ ) was seven times smaller than between 1981 and 1991.
<Decline in the percentage of Quebec's Anglophones from 14\% in 1951 to 9\% in 1996.

## Canada less Quebec

<Substantial average annual growth in the 1950s ( $2.9 \%$ ), the 1960s ( $2.2 \%$ ) and the 1970s ( $1.6 \%$ ), but lower from 1981 to $1991(1.1 \%)$ and from 1991 to 1996 (1.0 \%).
<Slight decrease in the percentage of Anglophones outside Quebec, from 78\% in 1951 to $77 \%$ in 1996.

## French Language Group

## Canada

<Substantial average annual growth during the 1950s ( 2.6 \%), smaller growth during the 1960s ( $1.3 \%$ ) and much lower growth during the two following decades $(0.7 \%$ and $0.6 \%$, respectively). During the past five-year period, growth was only $0.5 \%$.
<Decline in the percentage of Francophones in Canada's population, from 29\% in 1951 to $24 \%$ in 1996.

## Quebec

<Substantial average annual increases during the 1950s (2.8 \%), smaller during the 1960s (1.4 \%).
<Much smaller average annual increases during the following twenty-five years: $0.8 \%$ from 1971 to $1981,0.6 \%$ from 1981 to 1991 as well as over the next five-year period.
<Slight decline in the percentage of Francophones among Quebec's population, from $83 \%$ in 1951 to $82 \%$ in 1996.

## Canada less Quebec

$<$ Small average annual increases during the first two decades of the period considered ( $1.8 \%$ and $0.9 \%$, respectively).
<Little change in the number of Francophones during the 1970s, an average annual increase of 0.6 \% during the 1980s, and a slight decrease of $0.1 \%$ during the first half of the 1990s.
<Decline in the percentage of Francophones outside Quebec, from 7\% in 1951 to $4 \%$ in 1996.

## Non-official Languages

## Canada

<Substantialaverage annual increase during the 1950s (4.8 \%), but much smaller during the following two decades ( $1.4 \%$ and $1.1 \%$, respectively).
<Remarkable increase of 1 million from 1981 to 1991 and of 623,000 from 1991 to 1996 . The average annual growth was $3.2 \%$ for the 1981-1991 period and $3.0 \%$ for the 1991-1996 period.
<Increase in the percentage of Canadians with a non-official language as their mother tongue from $12 \%$ in 1951 to $17 \%$ in 1996.

FACTORS AFFECTING THE EVOLUTION OF LANGUAGE GROUPS

## Quebec

<Considerable average annual increase in the 1950s ( $9.4 \%$ ), followed by much smaller ones in the two following decades ( $2.8 \%$ and $1.3 \%$, respectively) and a marked average annual increase of $4.2 \%$ between 1981 and 1991 and of 2.8 \% between 1991 and 1996.
<A rise in the proportion of Quebecers with a non-official language as their mother tongue, from 4\% in 1951 to $10 \%$ in 1996.

## Canada less Quebec

<A large average annual increase during the 1950s (4.3 \%), followed by a much smaller increase in each of the next two decades ( $1.3 \%$ and $1.1 \%$, respectively).
<Very large average annual increases during the next fifteen years: $3.0 \%$ for the 1981-1991 period and $3.1 \%$ for the 1991-1996 period.
<Increase in the percentage of Allophones outside Quebec from 15\% in 1951 to $19 \%$ in 1996.

## Fertility

Differences in fertility in different language groups can have the effect of favouring an increase in one group, particularly in times when there is considerable difference in the size of families. This was the case in the 1950s and early 1960s, when Francophone women tended to have more children than their Anglophone counterparts. For example, in the five years between 1956 and 1961, the total fertility rate (births per woman) was 4.3 for women whose mother tongue was French and 3.8 for those whose mother tongue was English. Reproducing at a rate that was considerably higher than that of Anglophones had the effect of maintaining the proportion of Francophones in Canada, despite an immigration pattern that favoured the English mother tongue population. This was a continuation of the higher fertility of French-Canadian women which had existed for the first half of the 20th century. The difference in fertility was largely responsible for maintaining the relative strength of the French population in Canada at about 30\% between 1850 and 1950.

Sources : Sources: Lachapelle, R., Evolution of Fertility Differences between Language Groups in Canada, Canadian Social Trends, No. 10, Autumn 1988, Catalogue No. 11-008E, pp. 2-8. Statistics Canada, calculations by the authors.

The fertility of French Canadian women, however, declined in the 1960s, so much so that by the end of the decade they tended to have fewer children than Anglophones. During the early 1980s, fertility among French Canadian women was nearly three times less than that of the 1950s. The historical data show a marked decrease in fertility and the convergence of fertility rates of Anglophones and Francophones in Canada. The total fertility rate for Francophone women in the 1981-1986 period was 1.5, compared to 1.7 for Anglophone women. Whereas the
data for the 1986-1991 period confirmed the lower fertility of Francophone women, those of the 1991-1996 period showed a convergence between fertility rates of the two linguistic groups. This convergence is due to the increased fertility rate of Francophone women. Demographers consider the "replacement level" fertility to correspond to a total fertility rate of 2.1. Consequently, without increases brought on by immigration or shifts from other language groups, both the Francophone and Anglophone populations in Canada would eventually decline in the long term.

The fertility of women who have a non-official language as a mother tongue has been higher than that of either Anglophones or Francophones since the mid-1960s. However, we must be careful in assessing the magnitude of the impact of this higher fertility on the growth of non-official languages in this country, since children of immigrant women who are born in Canada often learn one of the official languages as their mother tongue.

## Immigration

Immigration has been the main source of the increase in the number of Canadians whose mother tongue is a non-official language. The 1996 Census showed that 65 \% of those born outside Canada (excluding non-permanent residents) had a language other than English or French as their mother tongue. Immigration has also contributed significantly to the increase in the Anglophone population in Canada, but has had far less impact on the growth of the French mother tongue group. Among immigrants counted in the 1996 Census as having arrived in Canada between 1951 and 1996, there were almost nine times as many with English mother tongue (1,4 million) as with French mother tongue ( 159000 ). In addition, all but $14 \%$ of those who immigrated to Canada during this forty-year period were living outside Quebec, in provinces and territories where the vast majority of them learn English and where many of their children have English as their mother tongue.

Immigration contributed significantly to population growth in Canada during the 1951 to 1996 period. During this period the number of immigrants in the population went from 2 million persons to nearly 5 million persons. In 1996 the immigrant proportion of the population was $17 \%$, the highest proportion since 1951. The proportion was between $15 \%$ and $16 \%$ in each of the censuses between 1951 and 1991. While the growth in both the immigrant population (3.8\%) and the population born in Canada (2.9\%) was remarkable in the 1951 to 1961 period, it is between 1991 and 1996 that the different in the rate of growth of the two population was the greatest. With an average annual growth rate of $2.9 \%$ during the five year period, the growth in the

FACTORS AFFECTING THE EVOLUTION OF LANGUAGE GROUPS
population which immigrated to Canada was more than three times the rate of growth of the population born in Canada $(0.8 \%)$.

Sources : Census of Canada, 1951, 1961, 1971, 1981, 1991 and 1996.
The knowledge of official languages is the most important factor which influences the linguistic integration into Canadian society. It's importance is, however, dependent on the period of immigration, the country of origin and the immigrants mother tongue.

In 1996, $75 \%$ of the immigrant Allophone population in Canada reported being able to conduct a conversation only in English, $4 \%$ only in French and $11 \%$ in both languages. An evaluation of the historical data regarding knowledge of official languages in the three largest census metropolitan regions (CMR) shows that, contrary to the case in Toronto and Vancouver where the percentage of the immigrant Allophone population capable of conducting a conversation in English has hardly changed since 1971 (remaining around 80\%), knowledge of official languages has evolved considerably in Montreal. In 1971, $37 \%$ of the Allophone population knew only English, 25 years later this proportion was around $22 \%$. This situation is
explained by the substantial increase in the proportion of Allophones who spoke only French ( $14 \%$ in 1971 compared to $25 \%$ in 1996) and who spoke both English and French ( $33 \%$ in 1971 and $44 \%$ in 1996). Thus while the proportion of Allophones reporting being able to conduct a conversation in English (including those reporting a knowledge of both English and French)has remained stable between 1971 (70\%) and 1996 ( $66 \%$ ), the proportion able to speak French has experience a remarkable increase, from $48 \%$ to $69 \%$.

Sources: Census of Canada, 1971, 1981, 1991 and 1996.

The unique situation of Quebec is equally obvious when we look at the evolution of the knowledge of official languages among the Allophone immigrant population in the Montreal CMR. The 1996 Census shows that the longer the period that an immigrant has been in the country, the less likely they are to know only the majority officiallanguage (i.e. French) and the greater the proportion who know both official languages. While $18 \%$ of those who came to Canada between 1951 to 1960 indicated in the 1996 Census that knew only French, this portion rises to 31\% among recent immigrants (those who arrived between 1991 and 1996). Similarly, the proportion of the immigrant population that indicated they knew both official languages went from $47 \%$ among those who came to Canada between 1951 and 1960 to $33 \%$ among recent immigrants. In fact the proportion of those who spoke

French was as high among recent immigrants as among those who arrived between 1951 and 1960. In the regions of Toronto and Vancouver the situation was very different. The proportion of the immigrant Allophone population who reported in the 1996 Census that they knew only the majority official language (i.e. English) was higher among those who arrived prior to the 1991 to 1996 period. The proportion who spoke both official languages was both small and diminishing. As a result the proportion of English speakers among the immigrant Allophone population was much weaker among recent immigrants than among those who arrived between 1951 and 1960-particularly in Vancouver.

Moreover, if we focus specifically on recent Allophone immigrants to Montreal, the proportion who know French rises with each census. In the 1971 Census, 16\% of recent Allophone immigrants reported knowing only French. By the 1981 Census this proportion had doubled ( $34 \%$ ) and subsequently fluctuated around $31 \%$ in the 1991 and 1996 censuses. If we include those who know English and French, the proportion of French speakers rises from $41 \%$ in 1971 to $64 \%$ in 1996. We can observe the same trends in Toronto and Vancouver with regard to the knowledge of English among recent Allophone immigrants. However, in Vancouver, the relatively small proportion of recent Allophone immigrants with a knowledge of English in the 1971 to 1981 period is attributable, in part, to the significant rise in the proportion of immigrants of Asian origin. These immigrants, unlike subsequent Asian immigrants, were less likely to know English.

Table 5.5 Allophone immigrant population by knowledge of official languages and period of immigration reported in the 1996 Census, Montreal, Toronto and Vancouver.

Source: 1996 Censusof Canada, unpublished tabulations.
Across the country immigration has had the effect of increasing the population with a non-official language as a mother tongue in the short run. The experience of immigrants to Canada during the early part of this century shows that in the longer term, descendants of immigrants often learn English as mother tongue. Census data show that outside Quebec, $53 \%$ of the children of Allophone women who came to the country prior to 1981, learned English as mother tongue, compared with $17 \%$ of those of Allophone women who came to Canada since 1981. However, the language transmitted to the child is above all related to the country of birth. As a result, outside Quebec, $57 \%$ of children born in Canada to Allophone immigrant women before 1981 had English as their mother tongue, compared to $24 \%$ of those born outside Canada. Among the children of women who came to Canada since 1981, $31 \%$ of those born in Canada had English as their mother tongue, compared to $8 \%$ of those born outside the country. The proportion of Allophone women whose

FACTORS AFFECTING THE EVOLUTION OF LANGUAGE GROUPS
children have French as their mother tongue remains almost non-existent during the two periods.

In Quebec, the longer term effect of immigration is more ambiguous than for rest of the country: the children of immigrant mothers learn either English or French as mother tongue. Immigrant mothers who came to the country prior to 1981 had children who learned English as mother tongue (18\%) a little more often than French ( $17 \%$ ). Since that time, the situation has changed and the children of immigrant mothers learn French as mother tongue (14\%) more often than English (5\%).

Once again we note a significant difference according to the country of birth of the child. Among children born to immigrant women who came to Canada prior to 1981, $20 \%$ had English as their mother tongue compared to $7 \%$ of those born outside the country. These proportions where $9 \%$ and $3 \%$ respectively among the children of women who arrived since 1981. In contrast, French was transmitted as a mother tongue to a smaller proportion of children born in Canada to mothers from other countries who arrived before 1981 (18\%) than to mothers who arrived since 1981(23\%). Among children born outside the country the proportions were respectively $11 \%$ and $8 \%$.

## Interprovincial Migration

Language is an important factor when considering the tendency of Canadians to move to another province. It is most vitalfor Quebec, since moving to that province often means settling in a more Francophone environment and leaving it often means a migration to a more Anglophone environment. The linguistic situation is significant in creating a social and cultural climate that influences the propensity of Quebecers to leave the province and that of the rest of Canadians to move to Quebec.

The 1996 Census showed that the percentage of Quebecers who had recently moved from another province was the lowest of all provinces and territories in Canada - three times less than the national average. Slightly over $1 \%$ of Quebecers were living in another province five years prior to the last census, compared with $2 \%$ in Ontario and 3\% or more in the rest of the provinces and the territories.

While language is an important reason why many Francophones stay in Quebec, it can have the effect of favouring the out-migration of Anglophones from the province and facilitating the integration of the migrants in the rest of the country. In the twenty-five years prior to the 1996 Census, approximately 400,000 Anglophones left Quebec for other provinces. This number is quite high, considering that the size of
the Anglophone population was 622,000 in 1996 compared to 789,000 in 1971. At the same time, Francophone departures amounted to 210,000 ( 5.7 million Francophones were enumerated in 1996 compared to 4.9 million in 1971).

The most significant migration of Anglophones from Quebec was during the 1976-1981 period: about 130,000 left Quebec for other provinces and only 25,000 came to Quebec from the rest of Canada, for a net loss of more than 100,000 in the Anglophone population. This migration coincided with the introduction of language legislation (Bill 101), which promoted French language status, and with favourable economic conditions in other large provinces. Between 1986 and 1996, Anglophone migration declined, resulting in net losses of 22,000 between 1986 and 1991 and of 24000 between 1991 and 1996 - far less than in any of the three previous quinquennial periods.

There is relatively little movement of Quebecers with French as a mother tongue to other provinces. Much of it is compensated by the arrival of Francophones from other parts of the country. During the twenty-five years prior to the 1996 Census, Francophone departures reached a peak (about 50,000) in the 1976-1981 period. Subsequently, the number of leavers declined. Since then, the Francophone population has experienced net gains.

FACTORS AFFECTING THE EVOLUTION OF LANGUAGE GROUPS

Table 5.6 Interprovincial Migration Between Quebec and Other Provinces and Territories by Mother Tongue, 1971-1976, 1976-1981, 1981-1986, 1986-1991 and 1991-1996

| Total | -329,900 | -246,800 | -28,600 | -54,500 |

[^8]If we study the destinations of Anglophones and Francophones who left Quebec in the 1991-1996 period, we find that there is very little difference in their patterns of migration. A considerable majority of both Anglophones and Francophones went to Ontario: almost two-thirds in the first case and more than a half in the second. British Columbia was the next most favoured destination for both language groups. New Brunswick, with its large French minority (a third of the population has French as mother tongue) and proximity to Quebec, was the third most favoured destination among Francophones, while Alberta was third for Anglophones leaving Quebec.

FACTORS AFFECTING THE EVOLUTION OF LANGUAGE GROUPS

The 51,13D Anglophanes who left Quebec movad to:

The 33,590 Francophones wha left Quebec moved to:

Chart 5.2B Interprovincial Migration Between Quebec and Other Provinces and Territories by Mother Tongue, 1991-1996

Source: 1996 Census of Canada, unpublished tabulations.
If we analyse the source of migrants coming to Quebec between 1991 and 1996, we find similar patterns of migration. The majority of Francophones (64\%) and Anglophones (65\%) came from Ontario.

Outside Quebec during the 1991-1996 period, Prince Edward Island, Alberta, British Columbia and the territories recorded net inflows of Francophones. The net inflow for British Columbia amounted to 6,200 , substantially higher than in the previous five-year period $(3,600)$. In Ontario, the net outflow of Francophones $(6,000)$ was more than three times higher than the one registered during the previous five-year period $(1,600)$. In contrast, the net outflow of Francophones from New Brunswick decelerated substantially between the two census periods, from 1,900 to 500 .

## Passing on the Language

The growth and decline of language groups is affected by the tendency of one generation to pass their language on to the next. We can study this phenomenon by looking at the mother tongue of children in relation to the mother tongue of their parents. Generally, when both parents have the same official language as their mother tongue, the children almost always have that mother tongue, be it English or French. However, when parents have a non-official language as mother tongue, the children often learn one of the officiallanguages (usually English) as mother tongue instead.

The tendency to pass on a language to children is influenced by a number of factors. Among the most important is the geographic concentration of the population which makes up a particular language group. For example, parents with a non-official language as their mother tongue are more likely to pass that language to their children if they live in a large ethnic community, than if they are isolated in a large Anglophone or Francophone population.

In Quebec, in 1996, $10 \%$ of children of less than 18 years of age were from husband- wife families in which both parents had a non-official mother tongue. About $10 \%$ of these children learned French as a mother tongue and $10 \%$ learned English. While English is transmitted as often as French, use of the latter language has expanded over the course of the last 25 years. In 1971, only $3 \%$ of children having two parents with a non-official mother tongue learned French as a mother tongue, while 14\% learned English. However, Allophone parents in Quebec are more likely to transmit a non-official mother tongue to their children(76\%) than those outside Quebec (65\%).

In the case of the children of English-French couples, an increasing proportion are learning French as a mother tongue both in Quebec and outside this province. In Quebec, French is now transmitted more often than English as a mother tongue. In 1996, $54 \%$ of the children learned French compared to $33 \%$ who learned English. In 1971 the situation was reversed, $49 \%$ learned French and 51\% learned English. Moreover, we have noted an increase in the transmission of both languages as mother tongue. In 1996, $12 \%$ of children had English and French as mother tongues compared to $10 \%$ in 1991. In the other provinces and territories, the progress of French has been even more considerable over the last 25 years. In 1971, $10 \%$ of children from English-French couples learned French as a mother tongue. In 1996 the proportion was $16 \%$. Moreover, the proportion with both mother tongues also increased between 1991 and 1996, from $4 \%$ to 5\%.

In 1996, in Quebec, children of couples in which both parents where of the Anglophone minority learned English as a mother tongue in 98\% of cases, while outside Quebec those from French parents received French in 93\% of cases. There have been, nonetheless, improvements in the situation of Francophones outside Quebec over the last 25 years since in 1971, $90 \%$ of children learned French as their mother tongue.

## Language Shift and Exogamy

While it does not have a direct bearing on the size and growth of language groups, language shift, the tendency to speak a language at home that differs from the mother tongue, is often an indicator of future change. The language spoken most often at home will often be the one passed to the children as their mother tongue.

Language shift is an indicator of the dominance of a language and does not necessarily imply the abandonment of the mother tongue. It is therefore possible that the mother tongue is used in the home, but less often than the other.

Over the last 25 years we have seen an increase in language shift among the Francophone minority outside Quebec. In 1971, 30\% of Francophones used a language other than French most often in the home, compared to $35 \%$ in 1991 and $37 \%$ in 1996. Only Francophones in British Columbia and the Yukon experienced a decline in the number of persons transferring to another language. Francophones in New Brunswick are the least likely to transfer to another language. From 1971 to 1996, the proportion having reported the use of a language other than French most often in the home has remained quite stable, going from $9 \%$ to $10 \%$. The Anglophone minority in Quebec has also experienced an increase in language shifts over the quarter century which preceded the 1996 Census, going from $8 \%$ to $10 \%$, however it remained relatively stable between 1991 and 1996.

In the country as a whole, the tendency of Allophones to speak either English or French most often at home declined from 1971 to 1996. In 1971, 47\% of Allophones had transferred to either English or French. By 1991 this proportion had declined to $44 \%$ and declined to $40 \%$ in 1996. This decline is principally attributable to the higher rates of immigration experienced during the 1986-1996 decade. In Quebec, the situation was quite different than that of the rest of the country. A much smaller proportion of Allophones spoke a language other than their mother tongue most often in the home, $32 \%$ in 1996 and this proportion has remained constant since 1971. However, French has attracted increasing numbers of Allophones. Among those who have experienced a transfer to either English or French, a growing proportion have adopted French: 39\% in 1996, compared to $37 \%$ in 1991 and $29 \%$ in 1971.

Source: Census of Canada, 1971, 1991 and 1996, unpublished tabulations.
Among those persons living as part of a couple, the mother tongue of the partner can be the reason motivating a language shift. When both members of a couple have the same mother tongue (an endogamous couple), the language spoke most often in the home will be very commonly the mother tongue. However, when members of a couple have different mother tongues (an exogamous couple), one or the other will have to speak a different language most often in the home. Where the other spouse is also able to speak both languages it is possible the other mother tongue will also be used in the home, though less often.

In Quebec, Anglophones living in couples are much more likely than in the past to have a French mother tongue partner: $29 \%$ in 1996 compared to $15 \%$ in 1971. An increasingly smaller proportion of Anglophones in exogamous couples speak English most often in the home: $52 \%$ in 1996 compared to $62 \%$ in 1971. Moreover, $85 \%$ of

Anglophones with a Francophone partner were English-French bilinguals in 1996, compared to $75 \%$ in 1971.

Outside Quebec, Francophones living in couples have increasingly an English mother tongue partner: $36 \%$ in 1996 compared to $22 \%$ in 1971. However, in this case the frequency of language shifts has always been very high (about $96 \%$ in 1971 and 1996), as a result the increase in the number of exogamous couples will not improve the situation of French as a language spoken most often in the home.

In the case of Allophones, given their increasing numbers, the phenomena of exogamy has not evolved as rapidly as Francophone and Anglophones living in a minority context. In 1996, both within and outside Quebec, more than $80 \%$ had a partner with a mother tongue other than English or French. In Quebec, more than two-thirds of Allophones in endogamous couples spoke a non-official language most often in the home, compare to $61 \%$ outside Quebec. In Quebec, $88 \%$ Allophones with an Anglophone partner spoke English most often in the home, while $65 \%$ of those with a Francophone partner had French as their home language. This situation was similar to that which existed 1971. In 1996, among Allophones with a Francophone or Anglophone partner about three quarters where English-French bilingual. In 1971, the rate of bilingualism among Allophones in AllophoneAnglophone couples (50\%) was much weaker than those in Allophone-Francophone couples (67\%).

[^11]
## Overview of the factors

Despite an increasing number of Francophones in Canada, their relative share of the Canadian population declined between 1951 and 1996. The two main factors that contributed to this decline were the reduction in the fertility of Francophone women and the immigration to Canada of many people whose mother tongue is a language other than French. The arrival of these immigrants added considerably to the Anglophone population, and to the population with a non-official language as mother tongue, but augmented the Francophone population only slightly.

In Quebec, the number of Francophones increased considerably, but the percentage has fluctuated between $80 \%$ and $83 \%$ in the 1951 to 1996 period. The departure of many Anglophones has enabled the Francophone population to maintain its relative strength despite a decrease in the fertility of Francophone women, and an increase in the Allophone population, particularly in the last fifteen years.

Outside Quebec, the number of Francophones has grown, but the percentage has declined steadily. This decline which, until 1991, resulted mainly from increases in the non-Francophone population which gained considerable numbers through immigration, is now also explained by a decrease in the numbers of Francophones. Besides the decrease of the fertility of Francophone women, the high tendency of children born to English-French couples to learn English as their mother tongue has contributed to this decline.

The size of the Anglophone population in Canada increased considerably between 1951 and 1996, while the percentage ( $60 \%$ in 1996) changed very little. Immigration and the tendency of children of immigrants to learn English as mother tongue contributed substantially to the increase in Anglophones. In Quebec, the English mother tongue group has declined both in number and percentage due to strong migration to other provinces and territories.

The population with a non-official language as mother tongue increased both in number and in proportion among the Canadian population. Immigration is the main source of growth for most language groups other than English or French, the majority of immigrants having a non-official language as mother tongue.

## CONCLUSION

The last forty-five years, from 1951 to 1996, were a time of considerable change in the linguistic portrait of our country. During this period the Canadian population more than doubled, from fourteen to twenty-nine million people. Such increases rarely occur without an effect on the composition of the population. This study has presented an overview of important changes, as well as a portrait of the current language situation.

The factors which have led to the present situation of English, French and other language groups - fertility, migration (international and interprovincial) and the transmission of a language to the next generation - will continue to play a vital role in the future evolution of language groups all over the country. It is difficult to imagine a reasonable scenario which would reverse the trend towards a reduction in the proportion of Francophones in the overall population of the country.

The fluctuations in the percentage of Allophones in the Canadian population are due to immigration. In the short run, immigration increases this population, but in the long run the children and grandchildren of immigrants tend to learn one of the official languages as mother tongue. Thus, heavy immigration could maintain or increase the percentage of Canadian Allophones briefly, but if the patterns observed for immigrants continue, a decline in their percentage will eventually take place.

The population whose mother tongue is English has grown as a result of immigration, as people with English mother tongue move to Canada, and as the descendants of immigrants from other language groups move toward using the language of the North American majority. While the short-term impact of heavy immigration is to increase the non-official language groups, use of the English language has experienced considerable long-term growth through immigration.

If immigration continues to favour the growth of the Anglophone group and fertility of the two official language groups remains similar to current levels, it is likely that both the number and proportion of Anglophones will increase in the future.

## Allophone

| English Speaker | Person who is able to conduct a conversation in <br> English. |
| :--- | :--- |
| French Speaker | Person who is able to conduct a conversation in <br> French. |
| Language Group | Population with a common mother tongue. |
| Language Transfer | Refers to the use of a language most often at <br> home which is different from the mother tongue. |
| Exogamy | Situation occurring when partners in a couple have <br> different mother tongues. |

## DATA QUALITY

Statistics used for this study come from the sample data from the 1971 to 1996 Censuses. For the 1971 Census, they are taken from responses obtained from one third of Canadian households that completed the long form questionnaire and, since the 1981 Census, from one fifth. The mother tongue data from this sample, especially for the 1991 and 1996 Censuses, are considered to be more accurate than those collected from the entire population, since there are far fewer multiple responses. Evaluations have shown that the number of people with more than one mother tongue is overestimated for households completing the short form questionnaire. The difference in the proportion of multiple responses obtained from each source is probably due to the fact that, in the short form, the question on mother tongue was the only language question asked while on the long form, other language questions were asked before the question on mother tongue. Respondents would be less likely to indicate two or more mother tongues if they were first able to indicate their language knowledge. However, the direction of most trends is consistent regardless of the data base used.

Since the 1981 Census, data from the $20 \%$ sample data base exclude institutional residents. Consequently, the figures for this census and the following ones are lower than they would be with this population included, and are not strictly comparable with previous censuses.

In the trend analysis, multiple responses were evenly divided between the languages reported. For example, if a given number of respondents provided English and French as their mother tongue or home language, half were assigned to the English category and half to the French. The same procedure was followed for multiple responses which included an official language and a non-official language.

## DATA QUALITY

The 1991 Census included, for the first time, residents of Canada who were non-permanent residents. These include people who hold student or employment authorizations, Minister's permits or who are refugee claimants, as well as their dependants. Prior to 1991, such people were considered foreign residents and were not enumerated. Since many of these people have non-official languages as mother tongue, their inclusion boosts the percentage of this population slightly for 1991 and 1996.

[^3]:    1. In 1971, Dutch includes respondents who reported Flemish or Frisian.
[^4]:    1. 

    On some Indian reserves and Indian settlements in the 1996 Census, enumeration was not permitted, or was interrupted before it could be completed. Moreover, some Indian reserves and Indian settlements were enumerated late or the quality of the collected data was considered inadequate. The impact of this under enumeration may be significant for some language groups, particularly those with small numbers.

[^5]:    1. The estimates for the second language numbers correspond to the difference between the number of people able to speak a given language and the population having that language as mother tongue.
[^6]:    1. The eligible school enrolment is the total school enrolment less the number enrolled in minority language programmes. For the 1980-1981 period, the data for Alberta are excluded from the total.
    2. Excluding Quebec.
    3. In Alberta, data on French immersion programmes are available back to the 1983-1984 school year. The number of students was then 14,523 or $3.2 \%$ of the eligible school enrolment.
