## September estimates of production of principal field crops

- With harvest underway, the good mid-summer weather conditions have Western farmers anticipating increased production of canola, as well as higher volumes of barley and wheat as compared to 2010. Farmers in Ontario and Quebec expect lower yields and a smaller crop of corn for grain in 2011, while Quebec farmers anticipate a record soybean production.

# Analysis

---

## September estimates of production of principal field crops

With harvest underway, the good mid-summer weather conditions have Western farmers anticipating increased production of canola, as well as higher volumes of barley and wheat as compared to 2010. Farmers in Ontario and Quebec expect lower yields and a smaller crop of corn for grain in 2011, while Quebec farmers anticipate a record soybean production.

### Total wheat production increases

Total wheat production in the West is expected to reach 21.7 million metric tonnes in 2011, up 3.0% from 2010. Yield has been flat for the past four years and 2011 sees this trend continue with an anticipated yield of 40.1 bushels per acre.

The increase in production is mainly attributed to an increase in durum wheat. Durum wheat production is expected to increase 30.2% over 2010 to 3.9 million tonnes, on the strength of increases in anticipated harvested area, up 27.5%, and in expected yield, from 36.1 to 36.9 bushels per acre in 2011.

### Increased canola production expected

Western farmers reported that canola production could reach 12.8 million tonnes, up 1.1% from 2010 production. The increase is the result of a record harvested area of 17.9 million acres, an increase of 6.3% over 2010.

The expected yield of 31.6 bushels per acre represents, however, a decline of 4.8% from 2010. Of the four western provinces, only Manitoba expects its canola production to decline from 2010 levels.

### Barley production increases

Despite a lower harvested area as compared to 2010, Canadian farmers anticipate that increased yields of barley will lead to a production of 7.9 million tonnes, an increase of 292,600 tonnes, up 3.8%, from 2010.

Barley yields are expected to increase to 62.5 bushels per acre in 2011, up 5.6% from 2010. The increase is concentrated in Saskatchewan, where production is expected to reach 2.5 million tonnes in 2011, up from 1.9 million tonnes in 2010.

### Smaller corn for grain harvest for Ontario and Quebec farmers

In Ontario, production estimates for corn for grain were down 13.8% as compared to 2010, to 6.7 million tonnes, the result of a 23.4 bushels per acre drop in yield, to 140.6 bushels per acre. Harvested area should remain almost unchanged from 2010 at 1.9 million acres.

Similarly, Quebec farmers expect corn for grain production to fall 12.9% to 3.0 million tonnes in 2011, an anticipated decrease of 440,000 tonnes from the 3.4 million tonnes in 2010. The expected drop would be, primarily, the result of the 12.2% decline in yield to 130.0 bushels per acre, from 148.0 bushels per acre in 2010. The decline of 0.8% in seeded area for corn for grain represents the fourth consecutive year that Quebec farmers have seeded fewer acres to this crop.

### **Soybean national production expected to drop from record 2010 levels**

At the national level, soybean production is expected to decline to 3.9 million tonnes, down from 4.3 million tonnes in 2010. Most of this decline comes from Ontario where, despite an amount of harvested acres virtually unchanged from 2010, yield is expected to drop by 5.5 bushels per acre to 40.5 bushels per acre. Manitoba farmers also expect a lower average yield, from 31.4 bushels per acre in 2010 to 25.7 bushels per acre in 2011.

Quebec farmers, however, are expecting a second consecutive record soybean harvest in 2011, at 820,000 tonnes, 13,000 tonnes more than in 2010. The 14.6% increase in harvested area is expected to make up for the 11.3% decline in average yield.

#### ***Auxiliary data source***

*As an additional tool to assess the growing conditions of Canadian field crops during the crop year, readers are invited to visit the Crop Condition Assessment Program web application, where a vegetation index of the crop land can be monitored weekly.*

1. Commercial stocks include condominium stocks as of December 2003.
2. Grain exports exclude seed.
3. Animal feed, waste and dockage calculated residually.
4. Some durum wheat is blended with other wheats and exported as wheat excluding durum.
5. May include small amount of use by food plants.

1. Grain exports and imports include seed.

# Concepts and definitions

---

## Crop categories

**Major field crops:** wheat, oats, barley, rye, flaxseed, canola, corn for grain and soybeans.

**Oilseeds:** canola, flaxseed, soybeans, and sunflower seed.

**Major special crops:** dry white beans, dry coloured beans, dry peas, lentils, mustard seed, sunflower seed, Canary seed and chick peas.

# Methodology and data quality

---

## Survey frame and sample selection

Every five years, the Census of Agriculture collects information on agricultural operations across Canada, including institutional farms, community pastures, Indian reserves, etc. The Census of Agriculture provides a list of farms and their crop areas from which a probability sample for the September Farm Survey is selected.

The target population for the September Farm Survey includes all farms in Canada enumerated in the Census of Agriculture except institutional farms, farms on Indian reserves and farms from the Northwest Territories, Yukon, Nunavut and Atlantic region.

Probability surveys can use two types of sampling frames: list and area. In the September Farm Survey, only the list frame is used in sample selection. This list frame is stratified into homogenous groups on the basis of Census characteristics (such as farm size and crop area) and sub-provincial geographic boundaries. A sample of approximately 14,100 farms has been drawn from the list frame for the September 2011 Farm Survey.

## Data collection

The September 2011 Farm Survey was carried out from September 1 to September 9. Data collection is undertaken using "Computer assisted telephone interview" (CATI) system.

## Edit and imputation

With the CATI system, it is possible to implement edit procedures at the time of the interview. Computer programmed edit checks in the CATI system inform interviewers during the interview of possible data errors, which can then be corrected immediately by the interviewer and respondent. CATI significantly reduces the need for subsequent telephone follow-up, thereby reducing respondent burden and survey processing time.

## Response rate

Usually by the end of the collection period, 80% of the questionnaires have been fully completed. The refusal rate to the survey is approximately 8 to 9%. The remainder of the sample unaccounted for can be explained by non-contact and non-response. Initial sample weights are adjusted by a process called "raising factor adjustment" in cases of total or partial non-response.

## Sampling and non-sampling errors

The statistics contained in this publication are based on a random sample of agricultural operations and, as such, are subject to sampling and non-sampling errors. The overall quality of the estimates depends on the combined effect of these two types of errors.

Sampling errors arise because estimates are derived from sample data and not from the entire population. These errors depend on factors such as sample size, sampling design and the method of estimation. An important feature of probability sampling is that sampling errors can be measured from the sample itself.

Non-sampling errors are errors which are not related to sampling and may occur throughout the survey operation for many reasons. For example, non-response is an important source of non-sampling error. Coverage, differences in the interpretation of questions, incorrect information from respondents, mistakes in recording, coding and processing of data are other examples of non-sampling errors.

## Estimation

The survey data collected are weighted in order to produce unbiased level indicators which are representative of the population. These level indicators then undergo a validation process, based on subject matter analysis, before final estimates are published.

## Revisions

The September crop production estimates contained in this publication are preliminary and as such are subject to revisions once final data will be received from the November survey.

## Data quality

The September production estimates are based on level indicators obtained from a probability survey of farming operations. The potential error introduced by sampling can be estimated from the sample itself by using a statistical measure called the “coefficient of variation” (c.v.). Over repeated surveys, 95 times out of 100, the relative difference between a sample estimate and what would have been obtained from an enumeration of all farming operations would be less than twice the c.v.. This range of values is referred to as the “confidence interval”. While published estimates may not exactly equal the level indicators due to the validation, these estimates do remain within the confidence interval of the survey level indicators. For the September Farm Survey, c.v.’s range from 3% to 10% for the major crops. Coefficients of variation for specialty crops and small areas are usually within 11% to 25%.

## Data confidentiality

Data confidentiality is ensured under the *Statistics Act*, which prohibits the divulging of individual or aggregated data where individuals or businesses might be identified.

# Field crop reporting series calendar

---

## Catalogue 22-002-X

The eight reports in this series, which are released at strategic times during the crop year, contain data on stocks of grain and crop area, yield and production. Three reports provide data on stocks of grain at both farm and commercial positions for Canada and the provinces (report nos. 1, 3 and 6). The first report on seeded area (no. 2, in April) contains the seeding intentions of producers, while the June report (no. 4) contains the actual seeded areas of field crops. Yields and levels of production by province are estimated before harvest (report no. 5), during harvest (no. 7) and after harvest (no. 8). Release time for all reports is 08:30 a.m., Eastern time. For further information, please contact Client Services, Agriculture Division, Statistics Canada at 1-800-465-1991 or by email: [agriculture@statcan.gc.ca](mailto:agriculture@statcan.gc.ca).

Report No. and Title	2011 Release Dates
1 Stocks of principal field crops at December 31, 2010	February 4
2 March intentions of principal field crop areas	April 26
3 Stocks of principal field crops at March 31, 2011	May 6
4 Preliminary estimates of principal field crop areas	June 23
5 July 31 estimates of production of principal field crops	August 24
6 Stocks of principal field crops at July 31, 2011	September 7
7 September estimates of production of principal field crops	October 4
8 November estimates of production of principal field crops	December 6

## Cereals and oilseeds review

### Catalogue 22-007-X

This publication provides up-to-date marketing data and analysis for wheat, coarse grains, oilseeds and special crops. Each monthly issue contains producer marketings, exports of grain and grain products, domestic and international supply-disposition tables, oilseed crushing and grain milling data, and cash and future prices. A situation report highlights the month's events.

Some issues contain annual supplementary data. They include the Prices supplement; the Processing supplement; the Methodology and concepts supplement; the Feed grain purchases supplement and the Grain storage & movement supplement.
