Note of appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

User information

Symbols

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0^s value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- p preliminary
- r revised
- x suppressed to meet the confidentiality requirements of the *Statistics Act*
- E use with caution
- F too unreliable to be published
- * significantly different from reference category ($p < 0.05$)

Note

Due to rounding, the sums of individual items may not agree exactly with the totals.

Five-year averages exclude years without data.

Concepts, methods and sources published annually in the October issue.

This publication was prepared under the direction of:

- **Marco Morin**, Chief, Crops Section
- **Faye Price**, Analyst, Grain Marketing Unit
- **Sheila Young**, Analyst, Grain Marketing Unit
- **Leslie Macartney**, Analyst, Grain Marketing Unit

Situation report — June 2011

Canadian crop progress

The Ontario Ministry of Agriculture, Food and Rural Affairs released its latest field crop report on July 20, 2011. Variability in the corn crop continued to plague a large percentage of the province's corn acres. Early planted corn has entered the critical silking stage when kernel numbers and potential yield are determined. Rainfall was needed in some areas of the province because of relatively low precipitation over the last month and where soil conditions were less than favourable during spring planting. Soybean plants were flowering with late planted beans at the beginning flower growth stage and early planted fields in full flower. Dry conditions had slowed growth and stressed the plants. Winter wheat harvest was in full swing throughout south-western Ontario. Yield reports have ranged from 40 to over 100 bushels per acre, but on average, have been lower than the past few years. Grain quality has been fair, with low fusarium pressure.

Manitoba Agriculture, Food, and Rural Initiatives issued its weekly crop report for the week ending July 25, 2011. Hot temperatures throughout the province helped crops that were behind in their development stage to advance. However, some crops felt stress from the high temperatures. The heat brought thunderstorms to many areas of Manitoba, with crops in the northwest region benefiting from the moisture. Early seeded canola was moving out of the bloom to podding stage. Some of these acres were showing the effects of early season wet conditions and recent heat, including thin stands, shorter plant height and decreased flowering time. Yields were expected to be impacted negatively. Late seeded canola was in varying stage of flowering. The winter wheat crop continued to advance, with the most mature crops about 2 to 3 weeks away from being harvested. Spring wheat crops that were seeded late were mainly in the flag leaf stage, while early seeded crops were in the dough stage.

Hot weather and wide spread rains helped Saskatchewan crops to advance, according to the Saskatchewan Ministry of Agriculture's crop report for the week ending July 18, 2011. However, some areas were still dry or experienced flooding after heavy rains. Approximately 85% of fall cereals and 74% of spring cereals were reported to be in good to excellent condition, while 72% of the oilseeds and 80% of the pulse crops were in good to excellent condition. The majority of crop damage was due to flooding, insects, diseases, wind and hail. Across the province, cropland topsoil moisture was rated as 9% surplus, 84% adequate and 7% short.

World supply and demand estimates

The United States Department of Agriculture (USDA) released its latest world agricultural supply and demand estimates on July 12, 2011.

Global wheat supplies for 2011/2012 were increased by 0.9 million metric tonnes to 852.4 million metric tonnes as higher beginning stocks more than offset lower expected world production. Larger carry in stocks for the United States and Russia accounted for most of the increase in world beginning stocks. World wheat production was lowered by 1.9 million metric tonnes with reductions in Canada, Ukraine and Mexico outweighing increases for the United States, Turkey, and EU-27. Production was estimated to be 662.4 million metric tonnes.

Global wheat exports were projected at 130.0 million metric tonnes, an increase of 2.4 million metric tonnes from last month. Exports were raised for the United States and Russia because of larger supplies. Imports were higher for EU-27, Egypt, Mexico, Japan, Sri Lanka, Malaysia and Yemen. Partially offsetting the increases were import reductions for the United States, South Korea and Vietnam.

World wheat consumption increased to 670.2 million metric tonnes because of higher wheat feeding in EU-27, Russia and Turkey; larger food use in Egypt, Japan and Russia; and expanded industrial use in Canada. Global ending stock estimates were lowered by 2.0 million metric tonnes to 182.2 million metric tonnes with most of the decline expected in Russia, Canada and the United States.

For the 2011/2012 year, global coarse grain supplies were projected to be 1307.6 million metric tonnes, or 10.3 million metric tonnes higher than previous estimates. The increase was mostly due to higher corn beginning stocks and production in the United States. Higher imports for China led to an increase in global corn trade for 2011/2012. Chinese corn imports were estimated at 2.0 million metric tonnes, an increase of 1.5 million metric tonnes from June estimates. The increase was a reflection of a recently announced US sale to China and favourable pricing opportunities for US corn into southern China where growing demand is reducing stocks.

Global corn consumption is to increase by 5.9 million metric tonnes to 877.6 million metric tonnes with higher expected feeding in China, the United States and Ukraine and higher industrial use expected in the United States and Canada. Ending stocks were projected to be 3.8 million metric tonnes higher with the increase in US stocks only partially offset by reductions for Canada and Mexico.

Global oilseed production for 2011/2012 was estimated at 455.5 million metric tonnes. This represents a decrease of 1.4 million metric tonnes from last month as lower soybean, peanut and rapeseed production estimates were only partially offset by increases for sunflower seed. Global soybean production was expected to be lower by 1.3 million metric tonnes at 261.5 million metric tonnes. Lower production in the United States was the main driver of the decrease. Other changes include: decreased canola production for Canada; increased rapeseed and soybean production for Russia; higher sunflower seed production for Ukraine and Russia; and lower canola, cottonseed and peanut production for the United States.

United States acreage estimates released

The USDA released its 2011 acreage estimates for principal field crops on June 30, 2011.

Corn planted for all purposes was estimated at 92.3 million acres, an increase of 5% from last year. This was also the second highest planted acreage in the United States since 1944, behind only the 93.5 million acres planted in 2007. Producers expected to harvest 84.9 million acres for grain, 4% more than last year. High prices and strong demand encouraged producers to expand their acres, in spite of planting delays and difficulties.

An estimated 75.2 million acres was planted to soybeans in 2011. Acres decreased 3% from last year. Area for harvest was also projected to be down 3% at 74.3 million acres. Increased competition for acres from corn and spring seeding delays impacted the amount of land seeded to soybeans. The states of New York and North Dakota reported having record high planted acreage for soybeans.

The area planted to all wheat was approximately 5% higher than in 2010 at 56.4 million acres. Winter wheat planted area increased 10% from 2010 to 41.1 million acres. Broken down, these acres included 29.1 million acres of Hard Red Winter, 8.3 million acres of Soft Red Winter, and 3.7 million acres of White Winter Wheat. Other spring wheat acres totalled 13.6 million acres, of which 12.9 million acres were Hard Red Spring wheat. Seeded area for durum wheat in 2011 was estimated at 1.70 million acres, down 34% from the previous year. Flooding in the Northern Plains, in particular North and South Dakotas, reduced other spring and durum wheat acres.

Flaxseed genome cracked

Researchers at the University of Alberta have deciphered the genetic code for flaxseed using a highly efficient sequencing procedure developed by the Beijing Genomics Institute. Canadian researchers will now have the genetic information to accelerate improvements for flaxseed and to determine ways to adapt the seed to modern uses.

Flaxseed was the first crop to be sequenced using *de novo* (Latin for “from nothing”) assembly of Illumina whole-genome shotgun sequencing (WGS). The Illumina WGS technology is much less expensive than previous genome-sequencing approaches, but has proved to be as valid as earlier technologies applied to such crops as rice.

From an agricultural perspective, researchers had historically had access to only a few flax DNA markers until this successful genome project. There are now over a thousand DNA markers for flax. Having the flax genome sequence and related data will help breeders and scientists advance improvements for flax.

Funding for the entire CDN\$12 million Total Utilization Flax Genetics (TUFGEN) project, of which the flax sequencing was a small part, came from Genome Alberta, Genome Prairie, Genome Canada and the National Institute of Agricultural Research (INRA, France).

Wheat genome to be mapped

International researchers hope to map the wheat genome within the next five years. The wheat genome is five times the size of the human genome, making it a difficult task. Knowing the DNA sequence will allow crop breeders to develop higher yielding and more disease resistant wheat varieties.

Researchers at the University of Saskatchewan Crop Development Centre, led by durum breeder Curtis Pozniak and spring wheat breeder Pierre Hucl, will map the genes in one of wheat's 21 chromosomes. A number of countries have selected a chromosome, or combination of chromosomes, that they are interested in sequencing. The Canadian team has chosen chromosome 6D because it contains a number of genes that are important to Western Canadian agriculture, according to Chris Pozniak. The chromosome 6D contains genes that are important to disease resistance as well as the overall end use quality of wheat.

The work of the Saskatoon research team will be funded by a variety of sources, including the federal and provincial governments, the Government of India and some farmer check-off money. A total of \$8.5 million will be received.

CGC announces grain variety deregistrations

The Canadian Grain Commission (CGC) announced upcoming grain variety deregistrations for wheat varieties belonging to the Canada Prairie Spring White (CPSW) and the Canada Western Red Spring (CWRS) and for flaxseed varieties.

Wheat varieties Snowwhite 475 and Snowwhite 476, belonging to the CPSW class, were deregistered effective April 28, 2011. However, the CGC had extended the period of eligibility for these varieties until July 31, 2011. Effective August 1, 2011, these varieties will only be eligible for delivery into the grade Wheat, Canada Western Feed.

Effective August 1, 2013, the CGC advised that the wheat variety Garnet belonging to the CWRS class will be deregistered. This variety will only be eligible for the grade Wheat, Canada Western Feed.

Flaxseed varieties CDC Mons and CDC Normandy will be deregistered effective August 1, 2013. Both varieties will only be eligible for the grade Flaxseed, 3 Canada Western/Canada Eastern.

The CGC also announced a number of Canada Western Red Winter wheat (CWRW) varieties will be reclassified under the Canada Western General Purpose (CWGP) class effective August 1, 2011. These varieties include: CDC Kestrel, CDC Clair, CDC Harrier, CDC Falcon and CDC Raptor. The changes are being made to allow the CWRW class to better reflect milling quality. Continuing to include varieties with high yield but low milling quality in the CWRW class affected the overall ability of the class to compete in global markets.

US ethanol subsidies to end

The United States Senate reached a deal to repeal the nearly US\$6 billion a year ethanol subsidy and end the tariff on foreign ethanol by the end of July. The agreement would reduce the United States' federal deficit by US\$1.33 billion and invest US\$668 million in new technologies to reduce the United States' dependence on oil.

Under the agreement, the 45-cent-per-gallon ethanol blender credit (VEETC) would be repealed on July 31, 2011 while the 54-cent-per-gallon tariff on ethanol imports would also expire on that date. The tax credit for cellulosic biofuel production, currently set to expire at the end of 2012, will be extended for three years, with annual caps on gallons. It will also be expanded to include promising fuels from algae. Reduced tax credits for alternative fuelling infrastructure, including electricity charging stations and natural gas fuelling stations, will be extended through 2014. The small-producer tax credit will expire at the end of 2012, with a reduction in per-gallon credit.

Prices

The Canadian Wheat Board (CWB) announced the 2011/2012 initial payments for the various grades of wheat and barley on July 25, 2011. The payments are effective August 1, 2011 for deliveries into the 2011/2012 pool accounts. The initial payments for base grades in each pool account were: \$208 per metric tonne for No. 1 Canada Western Red Spring Wheat 12.5; \$215 per metric tonne for No. 1 Canada Western Amber Durum 12.5; \$230 per metric tonne for Select Canada Western Two-Row barley; and \$155 per metric tonne for No. 1 Canada Western Feed Barley (Pool A).

Following the USDA's release of acreage estimates for principal field crops on June 30, Chicago Board of Trade (CBOT) corn futures stumbled to 3 $\frac{1}{2}$ month lows in a record-breaking price drop. The USDA estimated corn plantings and inventories as of June 1 at levels well above trade expectations, stunning market participants. Prices began to recover following announcements of large sales of corn to China and an "unknown destination".

At the end of the first quarter of the month of July, a "heat dome" settled over the Midwest, bringing temperatures topping 100 degrees Fahrenheit, just as corn was moving into a key stage of development, pollination. Concerns over the impact of the heat on yield potential pushed futures' prices sharply higher. Favourable conditions were needed to grow a large crop to replenish low inventories.

A break in the heat wave during the third quarter of July caused markets to pull back from a five-week high. Prices declined on profit-taking after the most-active December contract rose more than 22% since the beginning of the month. Spillover selling from losses in crude oil also added pressure on corn futures' prices. Market participants reduced risk over concerns about the lack of an agreement to raise the United States debt ceiling.

US wheat futures started the month on a weaker tone as the advancing harvest added supplies in the Northern Hemisphere. In France, a good-quality crop was being harvested, although yields were hurt by dryness. The Black Sea region was preparing to increase exports as harvest progressed.

Mid-month, spillover support from corn and external financial markets caused futures' prices to rally to near four-week highs. A recovery in the US dollar and increased export competition ended the sharp rally in the CBOT wheat futures after just two days. However, Minneapolis spring wheat and Kansas City hard red winter wheat contracts remained higher because of tighter supplies of good protein wheat.

US wheat futures continued to move lower on concerns about diminishing demand. Exporters faced increasing competition from countries in the Black Sea region, where wheat was being offered for sale at a significant discount compared to United States and European wheat. As the month progressed, wheat futures' price found some support from a rallying corn market. Nearby wheat and corn contracts traded almost even with each other, unusual as wheat typically holds a premium to corn.

US soybean futures were underpinned throughout the month by weather uncertainties for developing crops during the summer growing season. Traders added risk premium to prices over concerns hot Midwest weather could threaten yields if it lingered into the crop's critical yield-producing stage in August. Sluggish demand, as China stepped back from the market, kept a ceiling on prices early in the month.

By the third quarter of July, speculative profit-taking pushed futures' prices lower. The market was fearful that a change in weather could abruptly change price trends, encouraging participants to book some profits. A combination of new and old export demand, crop uncertainties and strength in global vegoil markets limited losses, even as weather outlooks improved for the Midwest.

US soybean futures stumbled to two-week lows near month's end as improved weather conditions and external market pressure weighed on prices. Traders reduced exposure in riskier grain markets as cooler, wetter forecasts and continued concerns about the US debt ceiling's impact on the global economy encouraged them to decrease their holdings. Slower export demand added further weakness to the market. Support was found amid disappointing crop condition ratings. The threat of poor crop conditions as soybeans prepare to head into a critical pod filling stage of development encouraged traders to add risk premium back into prices.

At the beginning of July, Winnipeg canola futures were supported by concerns about lost production due to smaller than expected acreage and the relatively slow pace of farmer deliveries into the cash pipeline. Light commercial demand, including covering domestic crusher needs and the pricing of old export business to Japan, further underpinned futures' prices. The strong Canadian dollar and lack of fresh export business offset some of the upside momentum.

Canola futures continued to move higher on new weather outlooks calling for extreme heat to settle over the canola growing areas of Western Canada. The heat was seen as coming at the wrong time for crop development and could cause unexpected crop stress. Canola futures also moved in reaction to outside oilseed markets, including the CBOT soybean and soyoil complex, Malaysian palm oil and European rapeseed.

By the middle of July, a large portion of Western Canada was in the midst of a heat wave. The high temperatures, and resulting thunderstorms, kept uncertainty in the market, in spite of reports that the Canadian canola crop was developing well. Strength in the Canadian dollar continued to weigh on futures as the month progressed. Domestic crush margins deteriorated and canola looked less attractive in comparison to other oilseeds. A seasonal slow-down in end-user demand and increased farmer deliveries as the crop year wound down combined to limit the upside potential in the market.

1. Number 1 and number 2 represent the grade and quality of the grain.

2. Includes flour that is not specified.

3. Millfeeds are the by-products of the milling process used mainly for animal feed.

1. Excluding Durum.

2. Includes British Columbia.

Note(s): Deliveries are as reported by the Canadian Grain Commission (with any adjustments prorated monthly) plus estimates for unlicensed deliveries. Includes deliveries to condominium storage as of August, 2003. Negative deliveries may indicate that farmers removed more grain from condominium storage than they delivered.

1. Includes unlicensed shipments to U.S. markets.

2. Includes British Columbia.

Note(s): Deliveries are as reported by the Canadian Grain Commission (with any adjustments prorated monthly) plus estimates for unlicensed deliveries.
Includes deliveries to condominium storage as of August, 2003. Negative deliveries may indicate that farmers removed more grain from condominium storage than they delivered

1. Beginning in June, 2002 excludes deliveries to process elevators.

2. Includes unlicensed shipments to U.S. markets.

3. Includes wheat (excluding durum), durum wheat, oats, barley, rye, flaxseed and canola.

4. Includes British Columbia.

Note(s): Deliveries are as reported by the Canadian Grain Commission (with any adjustments prorated monthly) plus estimates for unlicensed deliveries. Includes deliveries to condominium storage as of August, 2003. Negative deliveries may indicate that farmers removed more grain from condominium storage than they delivered.

1. Includes a small amount of Alberta corn.

2. Includes a small amount of Saskatchewan corn.

3. Includes a small amount of eastern corn.

4. Includes a small amount of Manitoba peas.

5. Excludes grain products (soybean meal, canola meal, etc.).

Note(s): Excludes feedlots. Excludes feedmill purchases from licensed grain companies. Coverage of companies in Alberta is incomplete.**Source(s):** Statistics Canada, Agriculture Division, Feed Grain Purchases Survey.
