SEASONAL REVIEW 2010 – 2011¹

Summary

The potato is the most important vegetable crop in Canada, accounting for 32% of all vegetable farm cash receipts (FCR) and 18% of all horticultural FCRs in Canada, or \$972 million in the 2010 calendar year. Total potato production has been decreasing over the last five years. In 2010, total potato production was estimated at almost 4.4 million metric tonnes, which was a 4% decrease over the 2009 crop and a 14% decrease from 2006. The major producing provinces are Prince Edward Island (24%), Manitoba (20%), New Brunswick (14%), Alberta (14%), Quebec (12%), and Ontario (11%). A total of 138,813 hectares of land with potatoes were harvested in 2010, with an average yield of 31.65 tonnes per hectare.

Canada has been a world leader in the production of seed potatoes for more than 90 years. About 150 potato varieties are registered in Canada for the production of seed. The varieties grown in each production area are selected to meet the needs of specific markets and local adaptation. Russet Burbank, Shepody, Ranger Russet, Cal White and Umatilla Russet are the main frying varieties; Superior, Atlantic, Kennebec and Snowden are the main chipping varieties; Superior, Russet Norkotah, Chieftain, Yukon Gold, Norland, Ranger Russet, Goldrush, Sangre and Umatilla Russet are the leading table varieties.

In the 2010-2011 crop year, Canada exported \$218 million worth of fresh potatoes (table stock and seed potatoes). Processed potatoes (frozen and other), which Canada exported in the same time period, were valued at \$884 million. By far the largest export destination for Canadian potatoes and potato products is the United States. Our southern neighbours take in 81.2% of our potato exports, a value of \$895 million in 2010-2011. Mexico (2.8%) and Japan (2.7%) are the second and third largest export destinations. Canada imported a total value of \$366 million in potatoes in 2010-2011. Of this, \$249 million was from processed potatoes and the remaining \$117 million was from fresh potatoes.

British Columbia

The year 2010 proved to be a challenging year for potato production in the Fraser Valley and on Vancouver Island. In these areas, the spring planting season was interrupted by a prolonged period of cool, rainy weather that prevented growers from getting into their fields after some potatoes had been seeded. Some acres were lost at this time. The wet conditions also delayed planting of much of the crop, which resulted in a potentially later than normal harvest period. Then on August 31, much earlier than one would normally expect to see higher autumn precipitation levels, it began to rain heavily and routinely for the rest of the harvest season. Fields turned to quagmires that saw harvesters stuck up to their axles in many cases. The rain kept coming and growers continued to attempt to harvest. Some growers had limited success in salvaging a harvested crop, while a few were able to harvest little or no crop at all. About 45% of the average provincial potato crop was left to rot in the fields. This also affected harvesting of other storage vegetables. The extent of the crop losses led to federal-provincial assistance through the 2011 Canada-BC Excess Moisture Initiative. The smaller cohort of potato growers in the province's interior were unaffected by these issues and harvested normally with average yields.

During the summer, locally grown standard white potatoes faced increased levels of competition from imports from neighbouring states, lowering prices by 22% or \$231 per tonne for these normally premium priced varieties. The overall low provincial aggregate production level occurred in a year when the larger western U.S. potato market experienced rising price levels through the

¹ Most of the data are based on crop years that run from August of one year to July of the following year and are expressed as such (e.g. 2010-2011). Data based on calendar years are expressed as a single year (e.g. 2011). Seasonal reviews were prepared by provincial organizations – See Key Resources. Seasonal updates for Newfoundland and Labrador and Nova Scotia were not available at the time of publishing.

winter storage season as product shortages gradually developed in Idaho, Oregon, and Washington State. Unfortunately, local growers had little product to sell to the British Columbia market beyond the end of December when prices were on the rise. While local supplies lasted, grower prices for Canada No. 1 grade averaged \$410 per tonne for Russet varieties, \$585 per tonne for red varieties and \$624 per tonne for yellow varieties. Seed potato growers in the Fraser Valley were similarly affected by the fall harvest failure. Fields were abandoned as unharvestable and shortages of seed product for sale to local table potato growers for the spring 2011 planting season predictably occurred. The price per average tonne of seed potatoes remained at \$529.

Alberta

Near perfect moisture and weather conditions delivered an excellent yielding and quality seed crop in the Edmonton region. The Central Region received more moisture than required, which resulted in challenges in managing disease pressures and in the abandonment of some acreage. Overall, the central and northern growing regions produced a much larger crop on fewer acres than the previous two years.

For the southern growing regions, planted acreage was down approximately 6% as processors reduced contract volumes in response to depressed markets. Excessive rainfall in June resulted in the loss of approximately 10% of the planted acreage. The growing season was non-typical, lacking the heat and sunshine for which the province is known. Harvest was delayed due to wet conditions, which extended the season and added some bulking to what were going to be very light yields. The weather prevented the crop from fully maturing, which affected the return to growers as quality bonuses linked to maturity were not realized. Due to the loss of acres early in the season, the growers were not able to meet their contract volume obligations and potatoes were imported to satisfy processor needs.

Saskatchewan

With the exception of some severe spring flooding in some areas of the province, 2011 was everything that 2010 was not. The growing season was warm with timely rains. As a result, yields and tuber quality were exceptional.

Despite the fact that sales and prices were good in 2010, seed potato acreage declined again. Tablestock acres remained relatively stable, although producers were left scrambling to find alternate fields in the spring due to the flooding.

The harvest season was very warm, but it was dry and long as well, giving producers ample time to harvest all their acres.

Manitoba

The year 2011 was one of extremes for many Manitoba potato producers—from a wet spring to late plantings, to overly wet conditions, to a drought in August, capped off by a mid-September frost.

Growers entered the spring somewhat optimistically, expecting the acreage to be up 5% due to extra processing contract volumes. However, planting was dragged out by wet fields and the record flood on the Assiniboine River. As a result, for the first time in a number of years, significant acreage was planted in June.

The southern area was extremely wet in June and about 5% of the planted acreage was lost. The rain then stopped, and by August irrigation was running steadily. Early September saw hot temperatures that quickly matured the crop. Unfortunately, two nights of frost in mid-September halted any further bulking.

On the positive side, the dry harvest has led to a very storable crop, and there were very few issues with late blight or pink rot. Overall, there was about a 10% reduction in volume.

Ontario

In 2010, Ontario potato growers produced over 8 million hundredweight (cwt) of potatoes from 38,000 harvested acres. The value of the crop was about \$110 million. Approximately half of the production was used for potato chips and the other half for table consumption.

The 2010 growing season was very good in terms of temperature and rainfall, and the harvest season saw very good weather as well. Yields were generally good and the quality of the crop was excellent for both fresh and processed potatoes.

Market prices for tablestock were good, but never reached as high a level as expected because exports to Europe did not materialize to the extent anticipated.

Quebec

Potato planting began in early May and was completed in record time, thanks to the exceptional weather. The first harvests began just after mid-June, that is, seven to ten days earlier than usual. In most regions, the growing season was good, despite the fact that some fields suffered because of excessive heat. The Bas-Saint-Laurent, Gaspésie, and Saguenay-Lac-Saint-Jean regions had a very dry summer, resulting in lower yields and smaller potatoes.

The planted acreage remained stable at 17,489 hectares (43,200 acres). The average yield for the province rose to 272 cwt/ha, up slightly from recent years, for a total production of 11.6 million cwt of excellent quality potatoes. Prices were generally good, posting strong numbers in February.

New Brunswick

New Brunswick farmers planted approximately 49,000 acres of potatoes in 2011, down approximately 2,000 acres from previous years. The growing season started two weeks later than normal, in mid-May. Periods of excessive rainfall (24-36 inches) throughout the summer created ideal conditions for late blight, and some areas struggled to contain several outbreaks of the disease. A hail storm on July 12 affected approximately 3,500 acres of potatoes, causing lower-than-normal yields for many varieties. The bulk of the harvest season was very warm and harvest was delayed. As a result of the excessive rainfall and cold temperatures, there was a lot of damage to the tubers and several storages did not hold up.

Potatoes New Brunswick conducted a marketable product loss survey on November 1, 2011. The results of that survey showed a total marketable production loss of approximately 4 million cwt, a 32% reduction from the 2010 crop, because of the weather conditions during the growing season. The cold temperatures also affected the colour of the processing crop and many growers did not realize normal quality bonuses on their processing crop. Size was also affected by rainfall, resulting in higher cullage and lower bonuses. These same factors affected the tablestock crop, again resulting in fewer marketable potatoes sold per acre. In addition to these production problems, market prices for potatoes throughout North America were low because of above-average production in the western part of the continent. Overall, the 2011 crop is not proving to be profitable for the industry.

The average yield for New Brunswick was approximately 245 cwt/acre and total harvested acres were 46,500, for a total marketable yield of 11.4 million cwt.

Breakdown of 11.4 million (units cwt):

- 2,541,000 table
- 2,257,000 seed
- 6,578,000 processing

Prince Edward Island

The 2010 planting season was on par with an average year and the majority of the planting was completed by early June. The 2010 year marked a change in processing contract negotiations. A Prince Edward Island Potato Board order was amended to include a time frame for mediation and arbitration to ensure that contracts were settled prior to planting. Contracted volume on Prince Edward Island was reduced by 27.5% by one processor. The other processor did not reduce contract volume for 2010, but did reduce the number of contract growers.

Statistics Canada estimated Prince Edward Island's planted acreage in 2010 at 85,500 acres, up less than 1% from 2009. The Island had a good growing season without, in most cases, the weather challenges that had negatively affected the harvest in 2008 and 2009. The first load of new crop potatoes left the province on July 12, 2010.

After maincrop harvest, Statistics Canada estimated that Prince Edward Island growers left only 500 acres in the ground, compared to 3,000 in 2009. Statistics Canada estimated the average yield to be 300 cwt/acre, with total production of 25.7 million cwt. Crop quality was good, resulting in less cullage than the previous year. However, heavy snow loads in the winter of 2010-2011 resulted in some warehouse problems and the total number of dumped potatoes was 470,400 cwt. Although up from 2007, this was considerably less than the 2008 and 2009 crop years.

Large crops in Ontario and Quebec held prices in Canadian markets down for the majority of the shipping season. A drought in Europe, however, resulted in an increase of shipments from Prince Edward Island to this region, but primarily opened up the Caribbean market to increased shipments of table potatoes from the Island. Export shipments were up 112% from 2009.

The average price for 10-lb paper bags (Free on Board dealer) for the 2010-2011 season was \$1.85, up from the 2009-2010 average price of \$1.28. Although holdings were similar to 2008, the price did not match the average price for 2008-2009 which was \$2.18.

The full disposition of the 2010 Prince Edward Island potato crop was as follows:

Interprovincial and export shipments	8,528,011 cwt
Local use and processing	12,253,807 cwt
Cullage and loss	3,384,650 cwt
Seed	1,581,750 cwt
Total	25,748,218 cwt

Notes:

Biggest producer of seed: New Brunswick, Alberta, and Prince Edward Island produce 71% of seed.

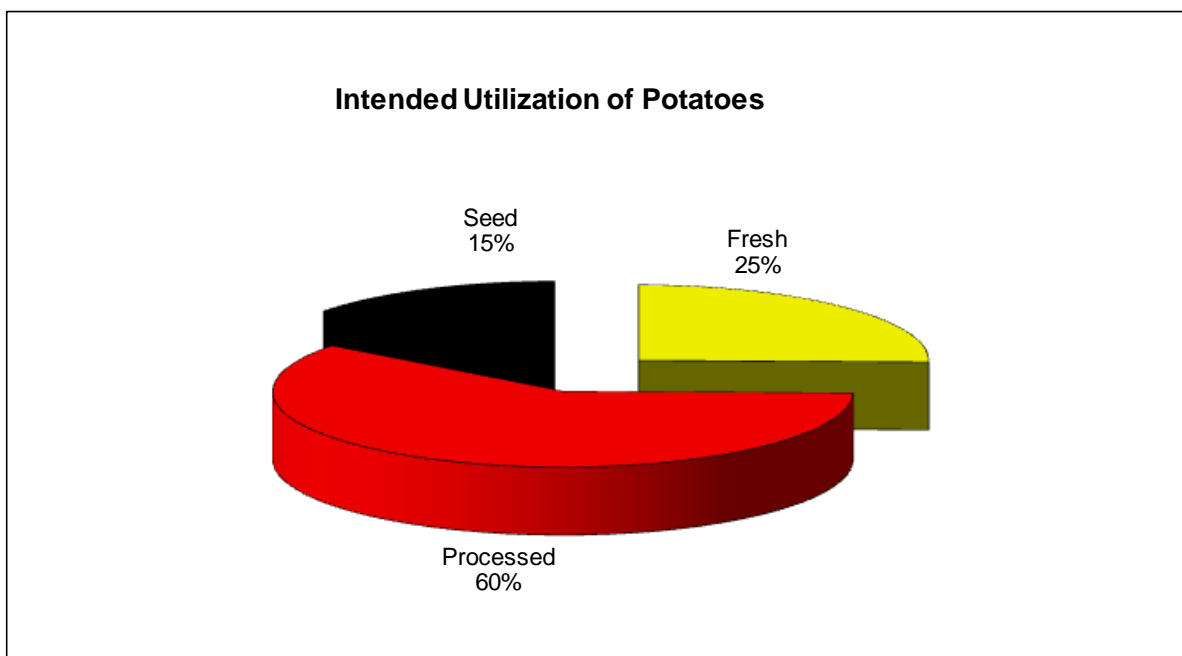

Manitoba production is for processed.

Alberta production is mostly for processed and seed.

Potatoes Available for Consumption¹ (adjusted for losses)

	2006	2007	2008	2009	2010
	Kilograms per person				
Potatoes-chips	3.01	3.09	3.16	3.07	3.2
Potatoes-frozen	6.58	7	7.16	7.49	6.98
Potatoes-other processed	3.76	3.84	3.82	3.65	3.47
Potatoes-total processed	13.35	13.93	14.14	14.21	13.66
Potatoes-white fresh ^{2,3,4}	15.55	14.49	13.54	13.59	13.57
Potatoes-white fresh and processed, fresh equivalent ^{2,3,4}	28.54	27.93	27.4	27.38	26.7

Notes:

¹ Experimental, use with caution. The data have been adjusted for retail, household, cooking and plate loss.

² Import and export data for "potatoes white" processed products have been converted to fresh.

³ Manufacture data for "potatoes white" includes potatoes used for seed.

⁴ Waste data for "potatoes white" includes cullage and animal feed beginning in 1982.
