Canadian Contractor Report of Hydrography and Ocean Sciences

Contractor reports are unedited final reports from scientific and technical projects contracted by the Ocean Science and Surveys (OSS) sector of the Department of Fisheries and Oceans.

The contents of the reports are the responsibility of the contractor and do not necessarily reflect the official policies of the Department of Fisheries and Oceans.

If warranted, contractor reports may be rewritten for other publications of the Department, or for publication outside the government.

Contractor reports are abstracted in *Aquatic Sciences and Fisheries Abstracts* and indexed in the Department's annual index to scientific and technical publications.

Contractor reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page. Out of stock reports will be supplied for a fee by commercial agents.

Regional and headquarters establishments of Ocean Science and Surveys ceased publication of their various report series as of December 1981. A complete listing of these publications is published in the *Canadian Journal of Fisheries and Aquatic Sciences*, Volume 39: Index to Publications 1982. The current series, which begins with report number 1, was initiated in January 1982.

Rapport canadien des entrepreneurs sur l'hydrographie et les sciences océaniques

Cette série se compose des rapports finals non révisés préparés dans le cadre des projets scientifiques et techniques réalisés par des entrepreneurs travaillant pour le service des Sciences et levés océaniques (SLO) du ministère des Pêches et des Océans.

Le contenu des rapports traduit les opinions de l'entrepreneur et ne reflète pas nécessairement la politique officielle du ministère des Pêches et des Océans.

Le cas échéant, certains rapports peuvent être rédigés à nouveau de façon à être publiés dans une autre série du Ministère, ou à l'extérieur du gouvernement.

Les rapports des entrepreneurs sont résumés dans la publication *Résumés des sciences halieutiques et aquatiques* et ils sont classés dans l'index annuel des publications scientifiques et techniques du Ministère.

Les rapports des entrepreneurs sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre. Les rapports épuisés seront fournis contre rétribution par des agents commerciaux.

Les établissements des Sciences et levés océaniques dans les régions et à l'administration centrale ont cessé de publier leurs diverses séries de rapports en décembre 1981. Une liste complète de ces publications figure dans le volume 39, Index des publications 1982 du *Journal canadien des sciences halieutiques et aquatiques*. La série actuelle a commencé avec la publication du rapport numéro 1 en janvier 1982.

ABSTRACT

G. A. Borstad Associates Ltd.. 1992. Catalogue of Geo-Referenced NOAA AVHRR Satellite Data of the Beaufort Sea, 1980-1991. Can. Contract. Rep. Hydrogr. Ocean Sci. No 42 49 p.

As part of research studies at the Institute of Ocean Sciences (Department of Fisheries and Oceans) in Sidney, British Columbia, a large collection of digital satellite imagery has been archived. This catalogue presents that part of the collection which has been geo-referenced for the western Canadian Arctic. The data is from the Advanced Very High Resolution Radiometer (AVHRR) on board the National Oceanic and Atmospheric (NOAA) series weather satellites. The photographic catalogue has been selected to represent the best example per calendar week for the period 1980 to 1991.

Keywords: Beaufort Sea, arctic, remote sensing, NOAA AVHRR, satellite imagery, archives, catalogue.

RESUMÉ

G. A. Borstad Associates Ltd.. 1992. Catalogue of Geo-Referenced NOAA AVHRR Satellite Data of the Beaufort Sea, 1980-1991. Can. Contract. Rep. Hydrogr. Ocean Sci. No. 42 49 p.

Dans le cadre des recherches effectuées à l'Institut des sciences de la mer (Ministère des Pêches et des Océans) à Sidney, Colombie-Britannique, une collection importante d'imagerie satellitaire numérisée a été archivée. Ce catalogue présente la partie de cette collection qui a été corrigée géométriquement et qui comprend la région ouest de l'Arctique canadien. Les données viennent de l'Advanced Very High Resolution Radiometer (AVHRR) à bord des satellites de la série National Oceanic and Atmospheric Administration (NOAA). Ce catalogue photographique inclut le meilleur exemple de chaque semaine civile pour la période de 1980 à 1991.

Mots clefs: mer de Beaufort, Arctique, télédétection, NOAA AVHRR, imagerie satellitaire, catalogue

ACKNOWLEDGEMENTS

Humfrey Melling provided access to the satellite imagery at the Institute of Ocean Sciences. As the Scientific Authority, Brian Smiley contributed to the catalogue's design and reviewed the manuscript. Jim Gower and John Wallace provided scientific and technical support for the Image Processing Laboratory at the Institute of Ocean Sciences. Charmaine Elgood, of G. A. Borstad Associates, reviewed, selected and prepared the satellite data and produced the photographic catalogue. The manuscript and photography were the responsibility of Lynne Armstrong, advised and edited by Gary Borstad and Scott Akenhead of G. A. Borstad Associates. Island Blue Print Co. Ltd. of Victoria, B.C., produced the colour copying and Fleming Express Press of Victoria provided the cover printing and binding.

Funding was provided by the Northern Oil and Gas Action Plan (NOGAP), arranged by Martin Bergman, Freshwater Institute, Winnipeg, Manitoba.

Geo-referenced NOAA AVHRR data of the Beaufort Sea in IOS collection
Selected best satellite image per calendar week, 1980 - 1991

APPENDIX A

Complete list of geo-referenced NOAA AVHRR data of the Beaufort Sea
in IOS collection, 1980 - 1991

1. INTRODUCTION

Remote sensing from satellites provides a unique data base covering large and remote areas at short time intervals. As part of research studies at the Institute of Ocean Sciences (IOS), Department of Fisheries and Oceans, in Sidney, British Columbia, a large collection of digital satellite imagery has been archived. This collection includes data for the north-east Pacific and western Arctic, from many research satellites including NOAA, NIMBUS, LANDSAT and GEOS. The largest part of the collection is digital imagery for the western Canadian Arctic from the Advanced Very High Resolution Radiometer (AVHRR) on board the U.S. National Oceanic and Atmospheric (NOAA) series weather satellites. These data offer an invaluable window on this remote area, revealing ice structure and movement, water temperature and turbidity, cloud cover, land temperature, and snow and ice coverage.

This catalogue will make the IOS archives more accessible and useful for scientists of all disciplines, by providing an up-to-date listing of IOS archive holdings of AVHRR imagery of the Beaufort Sea as of March 1992.

2. HISTORY AND PURPOSE OF THE IOS DATA ARCHIVE

The IOS Beaufort Sea collection began in the late 1970's and is still growing. The archive has not been built up systematically, but resulted from a variety of unrelated research projects over many years. It therefore reflects the time periods and locations of interest of those studies. Much of the Beaufort collection is from the activities of Dr. H. Melling of IOS, with funding from the Program for Energy Research and Development (PERD). Most of the data listed in this catalogue resides on magnetic tape at IOS, but some of the geo-corrected data is held by G.A. Borstad Associates Ltd.

3. THE NOAA SATELLITE SERIES

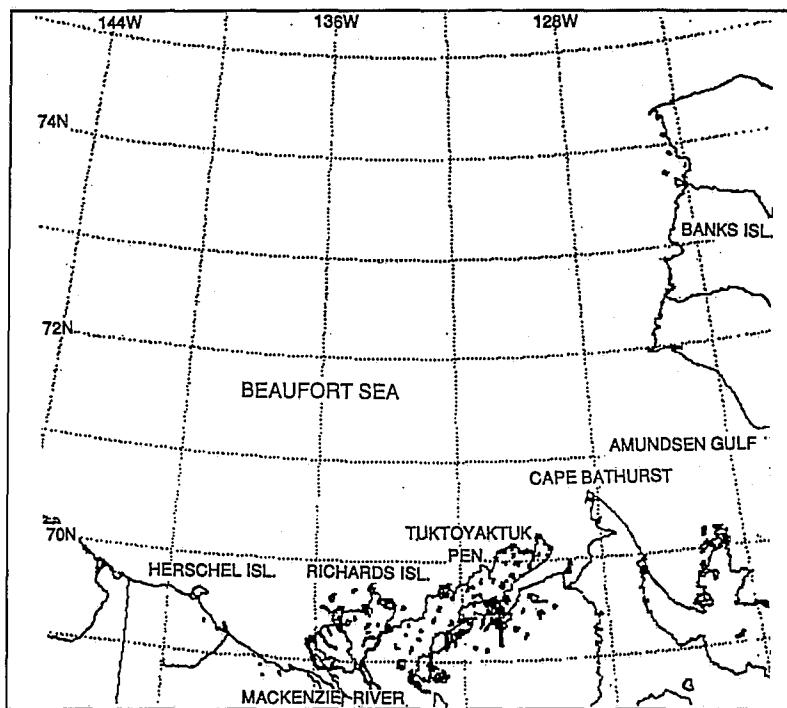

TIROS (Television and Infrared Observation Satellite) and the successive TOS (TIROS Operational System), ITOS (Improved TIROS Operational System) and TIROS-N/NOAA series have been the principal operational meteorological satellite systems for the United States and much of the world since 1960. The current third-generation series of American polar-orbiting weather satellites originated with Tiros-N in 1978 and has included six NOAA series satellites, which have been successively replaced as their orbit decayed or their sensors failed. Each of the NOAA satellites has been equipped with an AVHRR, a scanning radiometer which covers a 2,350 kilometer wide swath. This sensor gathers electromagnetic energy reflected, emitted or backscattered from the earth below its path with a spatial resolution of approximately 1.1 kilometers. AVHRR has spectral channels in the visible (.58-.68 μm), near infrared (.725-1.1 μm), middle infrared (3.55-3.93 μm), and thermal infrared (10.3-11.3 μm). Some of the later sensors also have a 11.5-12.5 μm channel. The visible and near infrared channels have been used to identify clouds, vegetative indices, land and water boundaries as well as snow and ice extent. Since the sensor responds to the cumulative signal from the target and the intervening atmosphere, including sun glint, clouds, fog, and atmospheric aerosols and particles, it is dangerous to use the raw imagery for any but the most localized or simple analyses.

4. IMAGE NAVIGATION

The raw satellite image is distorted by the earth curvature and by the scan geometry of the sensors. To allow comparison with maps and for comparison of images taken at different times, most of the images in the IOS collection have been geometrically rectified or navigated. Reflecting the fact that the work was done for a variety of projects over many years, the imagery included in this catalogue has been navigated to either a conic or an equi-rectangular projection at 1.3, 1.5 or 2.9 km resolution. The rectification process used at IOS gives good agreement with the World Data Base 2 digital coastline such that disagreements between the coastline and the image are never more than one pixel. A coastline

map has been overlaid on the images in this catalogue to aid in locating the features.

Curving lines occasionally appear across the top of the imagery in this catalogue. These arise where the tracking antenna loses synchronization with the data transmission from the satellite, and most often just before the sensor goes beneath the antenna horizon. The Beaufort Sea is very near the tracking horizon for both the receiving facilities used to acquire this data (Oceanography Department, University of British Columbia, Vancouver; Atmospheric Environment Service, Edmonton).

Map of the Southern Beaufort Sea with place names.

5. METHOD OF ENHANCEMENT:

The Appendix listing in this catalogue includes all of the digital AVHRR data of the Beaufort Sea in the IOS archives. However, the photographic catalogue displays only one image each calendar week. As a rule, the image data was originally archived because it was cloud-free, but this was not always the case.

The image with the least cloud each week was chosen for the catalogue, but in some weeks, only a cloudy image was available. The data was photographed from the video screen of the IOS PDP11/44 Adage system and the photographs later colour photocopied to make the catalogue.

Considerable care is required in interpreting the imagery in this catalogue. Because of changes in illumination through the seasons and differences in viewing geometry between orbits and cloud cover, the digital level of the imagery can differ strongly even between consecutive days. The image digital values were all colour coded and individually enhanced using a rainbow-like lookup table progressing from black to blue, green, yellow, red and white. The enhancement varies considerably from image to image. For imagery for the months of April through September, where the visible band data is shown, this sequence indicates increasing radiance, usually with open water depicted as dark blue, and snow and ice shown as either yellow, red or white depending on its brightness, a function of albedo, and illumination, among other factors. For winter months (typically October through the end of March) where the sun is below the horizon, thermal infrared band 4 data are shown. Cloud, thin ice and leads or small patches of open water all show as blue in the band 4 data, while the ice and land are depicted as yellow, red or white. Cloud can generally be recognized by its soft edges, while ice has sharper boundaries. Possible confusion may arise from the gradations in colour over the pack-ice. Cloud overlaying the ice pack will appear as blue (for example December 4, 1985).

Depending on the contrast range, the ice may all show as yellow, or yellow and red/red-brown or yellow/red/white all on the same day. This should not be read as ice thickness or any specific measurement, because the colour range is dependent on the recorded brightness level which varies from day to day. The same care must be taken when looking at the water, which may show as blue or black. The pseudo-colour range has been manipulated to simplify the patterns, rather than to compare days or to show the full digital range of the data.

6. SOME APPLICATIONS AND EXAMPLES:

The southern Beaufort Sea is a good target for the AVHRR because of the high contrast, at thermal and visible wavelengths, between ice, water and land. In summer months the warm and turbid Mackenzie River water can be easily distinguished from much colder, clearer waters off the Tuktoyaktuk Shelf. Visible AVHRR bands, particularly band 1, respond more or less linearly with total suspended particulate load (Figure 1). The infrared bands delineate plumes of warm water extending out of the mouth of the Mackenzie River (Figure 3 and frontispiece image to the colour catalogue). With *in situ* temperature measurements, these images can be empirically calibrated. The ice itself is bright and is well imaged with the visible bands in the summer (Figure 2, 4 and 5). In the winter, there is sufficient thermal contrast between ice and water to map the larger leads.

An eddy in Amundsen Gulf, formed from the Beaufort Gyre, a circulation pattern which moves the ice south and west from Banks Island, is outlined by the trailing ice edge in Figure 6. In this same area the formation of new ice in October shows in Figure 7. Ice movement can be followed by watching the large floe of characteristic rounded triangular shape, first seen in the December 29, 1985 image, migrate westward to the image edge, on April 08, 1986. Interesting details of water circulation patterns are most evident in the enhanced thermal infrared band data.

Many of the IOS studies in physical oceanography have focused on ice structure and water circulation (Carmack *et al.* 1989, Marko and McAleese 1992, Cherniawsky *et al.* 1987). The PERD Projects "Beaufort Sea Ice Motion" and "Subsurface Ice Characterization" (Melling) and "Mesoscale Ice Deformation and Limiting Stress in the Southern Beaufort Sea" (Topham) significantly increased the collection. There have also been several ecological studies of bowhead whales and other marine mammals which used satellite imagery to explain the movements and distributions of these animals (eg. Borstad 1985, Thomson *et al.* 1985, Fissel *et al.* 1987). Satellite imagery has also been used in support of studies of MacKenzie Shelf circulation and water chemistry (MacDonald *et al.* 1989).

7. DATA AVAILABILITY

Most of the data in the IOS archives is owned by the Department of Fisheries and Oceans, and is available for scientific studies for the cost of handling. Inquiries and requests for data should be addressed to G.A. Borstad Associates Ltd., 9865 West Saanich Road, Sidney, British Columbia, Canada, V8L 3S1.
