Note of appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

User information

Symbols

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0s value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- p preliminary
- r revised
- x suppressed to meet the confidentiality requirements of the Statistics Act
- E use with caution
- F too unreliable to be published
- * significantly different from reference category (p < 0.05)

Acknowledgements

This publication was prepared by Donald Cutts, Jesus Dominguez, James Duffy and Susie Knox of the Livestock Estimation Unit, under the direction of Bill Parsons, Chief, Livestock Section and Bishnu Saha, Unit Head, Livestock Estimations.

Special thanks to Jeffrey Smith, Robert Pagnutti, Barbara McLaughlin, Sandra Venturino and the CANSIM and Smart Publishing teams for their support and contribution to this publication.

The support of Agriculture and Agri-Food Canada and the provincial focal points for their review of the data are also gratefully acknowledged.

1.	Sow I	Inventory at January 1, 2002 to 2012	7

Highlights

- As of January 1, 2012, hog inventories were reported at 12.0 million head, up 1.1% from the same date a year earlier.
- There were 1.3 million sows and gilts reported, down fractionally from the same date a year earlier and 1.3% less than the number reported on the same date in 2010.
- Domestic hog slaughter totalled 21.3 million head in 2011, down 0.1% from 2010. Hog slaughter in the fourth quarter of 2011 is up 2.4% from the same quarter in 2010.
- Hog exports were reported at 5.8 million head in 2011, up 1.3% from 2010. Exports in 2011 were 8.4% below the number of hogs exported in 2009 and 41.8% lower than the number observed in 2007.

Analysis

Hog Inventories

Hog inventories were seen to have increased on a year-over-year basis on January 1, 2012. Hog inventories were reported at 12.0 million head, up 1.1% from 11.9 million on January 1, 2011 and higher by 1.6% from the same date in 2010. This represents the first successive increase in the January 1 inventories since 2006.

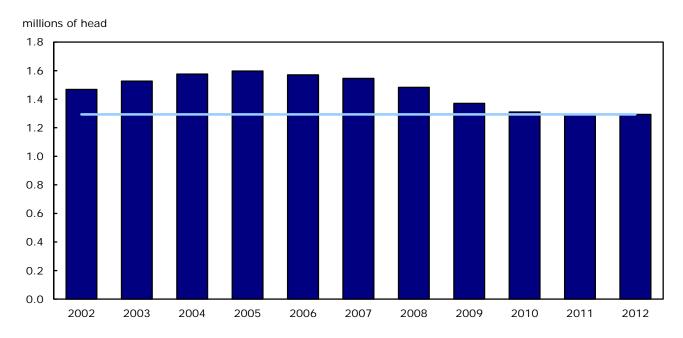

Text table 1
Hog inventories

	January 1 ^r 2011	October 1 ^r 2011	January 1 2012	October 2011 to January 2012	January 2011 to January 2012

British Columbia	79.0	88.0	89.0	1.1	12.7	

Note(s): The superscript r stands for revised.

The breeding herd continued to decline in 2011. There were 1.3 million sows and gilts reported at January 1, 2012, down fractionally from a year earlier and 1.3% less than number reported on the same date two years ago. The fourth quarter inventories of sows and gilts have not been at this level since 1999.

Chart 1 Sow Inventory at January 1, 2002 to 2012

Sows farrowed in the fourth quarter of 2011 were 1.0% higher than the number farrowed during the same period a year earlier. Sows expected to farrow in the first quarter of 2012 are estimated to be 0.1% above the fourth quarter of 2011.

Domestic hog slaughter totalled 21.3 million head in 2011, down 0.1% from 2010. Hog slaughter in the fourth quarter of 2011 is up 2.4% from the same quarter in 2010. Hog exports were reported at 5.8 million head in 2011, up 1.3% from 2010. This was the first annual increase since the peak observed in 2007. Exports in 2011 were still 8.4% below the number of hogs exported in 2009 and 41.8% lower than the number observed in 2007 prior to the introduction of the Country Of Origin Labelling (COOL) regulations in the US in the fall of 2008.

Hog slaughter prices strengthened throughout 2011. The farm product price index for hogs indicates that hog prices in the second half of 2011 reached levels not seen since 2004.

Number of pigs born during the quarter that were either on hand at the end of the quarter or had been sold.
 Export numbers from International Trade Division of Statistics Canada have been adjusted using secondary information to more accurately reflect province of origin. Canadian export totals remain unchanged.

3. Other disposition principally represents slaughter on a province of origin basis and may include hogs destined for export; varies by province.

Number of pigs born during the quarter that were either on hand at the end of the quarter or had been sold.
 Export numbers from International Trade Division of Statistics Canada have been adjusted using secondary information to more accurately reflect province of origin. Canadian export totals remain unchanged.

3. Other disposition principally represents slaughter on a province of origin basis and may include hogs destined for export; varies by province.

Concepts and methodology

Concepts

Livestock statistics

Inventory levels of the various types of livestock intended for sale in Canada are measured at specific times throughout the year. Surveyed operations are requested to include all animals located on the farming operation, regardless of ownership. They are also asked to include animals owned but pastured on a community pasture, grazing co-op or public land. Producers are asked to exclude animals owned but kept on a farm, ranch or feedlot operated by someone else. Inventory levels are estimated for cattle, calves, pigs, sheep and lambs. Estimates are also produced for certain categories of animals on the basis of age, sex, weight and/or purpose i.e. breeding or slaughter.

Current information on livestock inventories and related statistics such as supply and disposition enable those active in the agricultural sector to observe and assess changes in the industry, measure performance and keep the agricultural community and general public informed of developments. The primary data users are federal and provincial governments, producer boards, farmers and farm organizations, private business, academic research institutions and students. Livestock data assists governments in formulating agricultural policies and developing programs. Farming organizations use statistics in developing recommendations for producers and governments. Farmers make increasing use of prices, production, and marketing statistics in planning their operations. In addition, these livestock statistics are used in the calculation of farm incomes and in the Canadian System of National Accounts for indicators such as gross domestic product.

Methods

To produce livestock estimates, there are actually 6 different survey occasions. All of the survey occasions collect data primarily using Computer Assisted Telephone Interviews (CATI) although there are special procedures in place for the very large or complex operations.

Two of the occasions are the January Livestock Survey and the July Livestock Survey. These are large-scale general livestock surveys collecting data on cattle, hogs and sheep, referring to inventories at the 1st of the month. The probability samples include about 10,260 operations at January 1, and about 10,000 operations at July 1. These surveys collect data during a three-week period in the western provinces, Ontario and Quebec. Regardless of when operators respond, they are asked to report inventories as of January 1 or July 1. The livestock survey results are released, following processing and analysis, approximately seven weeks after the reference date.

Hog inventories are the focus of two other survey occasions collecting estimates of pig numbers at April 1 and October 1. This survey was initiated in 1998 as estimates from 1978 to 1997 were based solely on analytical tools. For the hog surveys, a sub-sample of the prior livestock survey is used. The probability samples are approximately 2,100 operations and 2,500 operations, respectively, at April 1 and October 1 and, similar to the livestock surveys, these CATI surveys cover the western provinces, Ontario and Quebec. Producers are requested to report their inventories as of the reference date, although the data are collected during a 7-day period near or before that date. The hog survey results are normally released three to four weeks after the reference date.

The June and November Atlantic Surveys are used to produce estimates for that region. These surveys are multi-purpose collecting data, primarily inventories, on livestock including cattle, hogs and sheep in addition to collecting data related to the area, yield and production of the principal field crops. The probability samples are about 1,000 operations in June and 1,100 operations in November. The results are released at the same time as the livestock results. For reference points where surveys do not exist for the Atlantic region, analytical tools are used to produce the estimates.

The total inventories are now distributed to a specific farm type, on the basis of survey results and sector level balance sheets. The two major categories are dairy and beef. The beef sector is then broken down to beef cattle on cow/calf and mixed beef and dairy operations; beef cattle on feeder, stocker/finish operations; and, beef cattle on feeding operations, which include feedlots.

Canadian exports to the United States are obtained from U.S. import custom documents and are officially released by the International Trade Division of Statistics Canada. These data try to register the province of origin of the commodity, but when unknown, will reflect the province of entry into the United States. Information from secondary sources is used by Agriculture Division of Statistics Canada to better estimate the province in which the commodity was raised/grown. Administrative data from the provinces are used to adjust the export numbers by province to better reflect provincial production. Though this methodology will result in different exports by province, the Canadian export totals will equal those released by International Trade Division. At release, some export data are unavailable. The missing data are imputed based on historical and auxiliary data sourced from the United States Animal and Plant Health Inspection Service. The imputed data are replaced with actual International Trade data when it becomes available.

To summarize, the livestock statistics are survey-based estimates. The survey relies on a list frame that is established every five years by the Census of Agriculture and updated to include new entrants, particularly large hog operations. The probability sample surveys are conducted by telephone. The survey results are analysed and corrected before the data are used to analyse the industry and fine-tune the estimates. The survey data are reviewed in a board environment before the commodity analyst works with the data primarily using supply-disposition analysis. The results of the industry analysis are reviewed by the board before being sent to the individual provinces. Once the data are finalised they are released to the public and published. The principal data released include inventories and summarized supply-disposition tables. The data also flow, via farm income estimates, to the Canadian System of National Accounts. In addition the data are used in the calculation of net farm income projections, produced by Agriculture and Agri-Food Canada in co-operation with Statistics Canada and the provinces.
