## Note of appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

## User information

## Symbols

The following standard symbols are used in Statistics Canada publications:
. not available for any reference period
.. not available for a specific reference period
... not applicable
0 true zero or a value rounded to zero
0 s value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
p preliminary
r revised
x suppressed to meet the confidentiality requirements of the Statistics Act
E use with caution
F too unreliable to be published

* $\quad$ significantly different from reference category ( $p<0.05$ )

## Notice to readers

Estimates released in this publication are based on the 2006 Census counts adjusted for census net undercoverage and incompletely enumerated Indian reserves to which is added the estimated demographic growth for the period going from May 16, 2006 to the date of the estimate.

These estimates are not to be mistaken with the 2011 Census counts.
Population estimates based on the 2011 Census counts, adjusted for census net undercoverage, will be available in September 2013 while the age and sex estimates will be available later in the fall.

The analysis in this publication is based on preliminary data. These data will be revised over the coming years, and it is possible that some trends described in this publication will change as a result of these revisions. Therefore, this publication should be interpreted with caution.

Most of the components, used to produce preliminary population estimates, are estimated using demographic models or based on data sources less complete or reliable, albeit more timely, than those used for updated or final estimates.

## Highlights

- On July 1, 2012, Canada's population was estimated at $34,880,500$, up 396,500 or $1.1 \%$ compared with the same date the previous year.
- For the year ended June 30, 2012, population growth was low in the Atlantic provinces and high in the Western provinces.
- Growth exceeded the national level in Alberta (+2.5\%), Saskatchewan (+2.1\%), Yukon (+2.0\%) and Manitoba (+1.2\%).
- One Canadian in two is at least 40 years of age. The median age of Canada's population has grown by 10.2 years in the past 30 years.
- The median age is higher for women (41.0 years) than for men (39.0 years).
- On July 1, 2012, the youngest populations in Canada generally resided in the territories, while the oldest lived in the Atlantic provinces.
- Newfoundland and Labrador was the place in Canada with the oldest population (44.2 years) while Nunanvut had the youngest (24.7 years).
- Among the provinces, Alberta had the youngest population (36.1 years).

## Section 1

## Total population

This section presents preliminary estimates of the population of Canada, the provinces and territories on July 1, 2012, along with an analysis of the components of growth estimated for the period going from July 1, 2011 to June 30, 2012.

### 1.1 National portrait

### 1.1.1 Population and growth

On July 1, 2012, Canada's population was estimated at $34,880,500$, up 396,500 compared with the same

Chart 1.1
Demographic growth rate, 1982/1983 to 2011/2012, Canada

### 1.1.2 International comparison

Canada's annual growth rate in 2011/2012 (+1.1\%) exceeds that of other industrialized countries for comparable periods, ${ }^{1}$ including the United States ( $+0.7 \%$ ), Italy ( $+0.3 \%$ ) and France ( $+0.5 \%$ ) as well as other countries, such as China (+0.5\%), Spain (+0.1\%), Sweden (+0.7\%) and the United Kingdom (+0.1\%). During the same period, several industrialized countries recorded nil or negative population growth, including Japan (-0.3\%) and Germany (-0.2\%). Canada's current population growth is not the highest

1. Data from other countries come from either population estimates produced by National Statistical Agencies or, when not available, from projections produced by United Nations Word Population Prospects, 2010 Revision (medium variant projections).
amongst industrialized countries. It is, amongst others, below the estimated rate in Australia (+1.4\%).

### 1.1.3 Differential growth of provinces and territories

Population growth can vary greatly among Canada's provinces and territories (Chart 1.2). In 2011/2012, population growth was low in the Atlantic provinces and high in the Western provinces. Growth exceeded the national level (+1.1\%) in Alberta (+2.5\%), Saskatchewan (+2.1\%), Yukon (+2.0\%) and Manitoba (+1.2\%). By contrast, the population declined in the Northwest Territories (-2.0\%) and remained relatively stable in Newfoundland and Labrador, Nova Scotia and New Brunswick.

Chart 1.2
Demographic growth rate, 2010/2011 and 2011/2012, Canada, provinces and territories

Compared with 2010/2011, population growth steeply declined in Prince Edward Island, going from 1.8\% in 2010/2011 to $0.3 \%$ in 2011/2012, in the Northwest Territories, going from $0.8 \%$ in $2010 / 2011$ to $-2.0 \%$ in 2011/2012 and in Nunavut, going from 2.2\% in $2010 / 2011$ to $0.4 \%$ in $2011 / 2012$. Conversely, growth accelerated in two provinces, Saskatchewan and Alberta.

In the last 30 years, the population of the Western provinces-the Prairie provinces and British Columbia-has grown substantially (+49.0\%), while the Atlantic provinces have seen their population increase only slightly (+4.4\%). By comparison, Canada's population increased by $38.9 \%$ during this period. Since 1982, the demographic weight of the Western provinces has increased by 2.1 percentage points, reaching 31.1\% on July 1, 2012, compared
with a decrease of 2.2 percentage points for the Atlantic provinces (6.8\%). In turn, the population of Ontario grew twice as rapidly ( $+51.4 \%$ ) as that of Quebec (+22.4\%) during this period. Among the provinces, Alberta has recorded the strongest growth since 1982 with an increase of $63.5 \%$.

Provincial differences in the intensity of the population growth in the past 30 years can be attributed to several factors: interprovincial migration, which often favours the Western provinces; often higher fertility in the Prairie provinces; and a greater influx of immigrants, especially in Ontario and British Columbia. On July 1, 2012, three-quarters of Canadians were living in three provinces: Ontario (38.7\%), Quebec (23.1\%) and British Columbia (13.3\%).

### 1.1.4 Factors of demographic growth

At the national level, population growth is the result of two factors: natural increase and net international migration. Natural increase is the change in the size of a population during a given period owing to the difference between the number of births and
deaths. Net international migration basically refers to the number of moves between Canada and abroad, accompanied by a change in usual place of residence; it consists of the following components: immigration, emigration, returning emigrants, net temporary emigration and net non-permanent residents.

International migration is gaining in importance as an engine of Canada's population growth, and since 1993 it has consistently been the main source of that growth ${ }^{2}$ (see Chart 1.3). In 2011/2012, net international migration was responsible for two-thirds of population growth in Canada. By comparison, net international migration ${ }^{3}$ accounted on average for $39.2 \%$ of population growth between 1982/1983 and 1992/1993. For the year ended June 30, 2012, net international migration was estimated at 267,200, more than double the figure for natural increase $(+129,400)$.

[^0]Chart 1.3
Factors of demographic growth, 1982/1983 to 2011/2012, Canada

### 1.1.5 Natural increase

According to preliminary data, natural increase for the year ended June 30, 2012 was estimated at 129,400, down from 131,100 for the previous year. In 2011/2012, natural increase resulted from the difference between the 381,600 births and the 252,200 deaths estimated for that year. The number of persons who were added by natural increase in 2011/2012 declined by approximately 1,700 compared with 2010/2011. This is due to the fact that deaths increased more rapidly than births during this period.

The rate of natural increase was $0.4 \%$ in 2011/2012, similar to the level observed since 2005/2006. The rate was still positive in all provinces and territories. However, it was weaker in the Atlantic provinces and much stronger in the territories. In Canada, Nunavut registered the strongest natural increase (+2.0\%), while Nova Scotia obtained the weakest in 2011/2012 (+0.0\%). That province ranked last in Canada in this regard for a fourth consecutive year. Among the provinces, Alberta had the strongest natural increase in 2011/2012 ( $+0.8 \%$ ). Indeed, that province has held this title continuously since 1980/1981.

### 1.1.5.1 Births

In 2011/2012, the birth rate, which is the ratio between births and the average population during the period, was estimated at $1.1 \%$ in Canada. In the past year, these rates were higher in the territories and lower in the Atlantic provinces. The highest birth rate was observed in Nunavut (+2.5\%), while among the provinces, Alberta and Saskatchewan led the way ( $+1.4 \%$ ), closely followed by Manitoba ( $+1.3 \%$ ). Birth rates of these areas are fueled by stronger fertility rates, as illustrated by the latest total fertility rates (TFR) ${ }^{4}$.

### 1.1.5.2 Deaths

In 2011/2012, the mortality rate, namely the ratio between deaths and the average population during the period, is estimated at $0.7 \%$ in Canada. Rates are lower in the territories and higher in the Atlantic provinces. Compared with 2010/2011, mortality rates for 2011/2012 were up in all provinces, except Quebec and Saskatchewan. In Canada, the highest mortality

[^1]rates were observed all Atlantic provinces (+0.9\%) while the Nunavut and the Northwest Territories ( $+0.5 \%$ ) had the lowest rates in Canada. Among the provinces, Alberta once again in 2011/2012 registered the lowest mortality rate in Canada (+0.6\%), for a 31st consecutive year. This is not unrelated to the fact that Alberta has the youngest population of any Canadian province (on this subject, see the section on estimates by age and sex).

### 1.1.6 International migration

Net international migration was estimated at 267,200 for the year ended June 30, 2012, up from the previous year $(+226,400)$. The net international migration rate reached $0.8 \%$ in 2011/2012, an increase compared with the previous year ( $+0.7 \%$ ). In 2011/2012, the net international migration rate was above the national average in four provinces: Saskatchewan (+1.3\%), Prince Edward Island ( $+1.1 \%$ ), Manitoba ( $+1.1 \%$ ) and Alberta ( $+1.0 \%$ ).

### 1.1.6.1 Immigrants

Nearly 260,000 immigrants took up residence in Canada in the year ended June 30, 2012, a number exceeding 250,000 for a third year in a row. In 2011/2012, the immigration rate was estimated at $0.7 \%$ in Canada. Among the provinces and territories, the highest immigration rates were seen in Manitoba ( $+1.2 \%$ ) and Saskatchewan ( $+1.1 \%$ ).

In recent years, the regional distribution of immigration in Canada has changed. In 2011/2012, Ontario continued to be the Canadian province receiving the most immigrants. However, Ontario's attraction has tended to diminish in the last few years. On average between 1982/1983 and 2004/2005, Ontario received between $44.3 \%$ and $59.6 \%$ of all immigrants coming to Canada. In 2011/2012, that province received only $38.9 \%$ of Canada's immigrants. This was its second lowest proportion since 1971/1972, the first year covered by the current demographic accounting system. Compared with 2010/2011, proportionally fewer immigrants settled in Ontario $(-3,800)$, British Columbia ( $-2,700$ ), Prince Edward Island ( $-1,200$ ) and Manitoba ( -700 ). Lastly, three provinces in 2011/2012 received a record number of immigrants: Quebec $(54,200)$, Alberta $(34,500)$ and Saskatchewan $(11,400)$.

### 1.1.6.2 Net non-permanent residents

The term "net non-permanent residents" represents the change in the number of non-permanent residents between two dates (in the present case, between July 1, 2011 and July 1, 2012). As with immigration, net non-permanent residents increased substantially in 2011/2012. For the year ended June 30, 2012, net non-permanent residents stood at 54,500, up strongly from 13,600 observed in 2010/2011. Net non-permanent residents were positive in 2011/2012 in all provinces. The highest rates of increase in the number of non-permanent residents were observed in Saskatchewan (+0.3\%) and Alberta (+0.3\%). And lastly, net non-permanent residents stood at record levels for two provinces in 2011/2012: Saskatchewan $(+2,900)$ and Prince Edward Island (+300).

### 1.1.7 Emigration, returning emigration and net temporary emigration

Preliminary estimates $\quad$ indicate that
in 2011/2012,

emigrated, $\quad 31,300$$\quad$| Canadians |
| :--- |

[^2]emigration stood at 29,100. Based on these three components, net emigration ${ }^{5}$ can therefore be estimated at nearly 47,300 for the year ended June 30, 2012. The net emigration rate is above national average ( $0.1 \%$ ) in three provinces: Ontario (0.2\%), Alberta (0.2\%) and British Columbia (0.2\%).

### 1.1.8 Interprovincial migration

At the provincial and territorial level, population growth results not only from natural increase and net international migration, but also from net interprovincial migration. This is the change in the size of a population during a given period as a result of population movements between Canada's provinces and territories, accompanied by a change in usual place of residence.

For the year ended June 30, 2012, net interprovincial migration was positive for only two provinces (see chart 1.4): Alberta (+28,200 or $0.7 \%$ ) and Saskatchewan $(+2,800$ or $0.3 \%)$. Alberta mainly benefited from migratory exchanges with certain provinces, with net gains of 10,700 with Ontario and 5,100 with British Columbia. Proportionally, Northwest Territories (-3.4\%), Nunavut (-1,5\%) and Prince Edward Island (-0.9\%) have recorded the largest interprovincial net migratory losses.

Chart 1.4
Interprovincial migration by province and territory, 2011/2012

### 1.1.9 Portrait of provinces and territories

### 1.1.10 Population and growth

As noted in the national section (Differential growth of provinces), for the year ended June 30, 2012, there was considerable variation among Canada's provinces and territories with respect to population growth. This section briefly summarizes the major trends for each province and territory.

### 1.1.10.1 Newfoundland and Labrador

During the year 2011/2012, the population of Newfoundland and Labrador remained relatively stable according to preliminary estimates. On July 1, 2012, the population of Newfoundland and Labrador was estimated at 512,700. The gains in international migration $(+1,200)$ were entirely offset by losses in migratory exchanges with the other provinces and territories $(-1,600)$.

### 1.1.10.2 Prince Edward Island

Prince Edward Island saw its population grow by more than 400 or $0.3 \%$ during the year 2011/2012.

On July 1, 2012, the population of Prince Edward Island was estimated at 146,100 . The gains made by this province in international migration $(+1,600)$ were almost completely offset by interprovincial migratory losses (-1,300).

### 1.1.10.3 Nova Scotia

According to preliminary estimates, the population of Nova Scotia remained relatively stable during 2011/2012. On July 1, 2012, the number of inhabitants of this province was estimated at 948,700 . The province's net international migration $(+3,100)$ was entirely offset by negative net interprovincial migration ( $-3,000$ ).

### 1.1.10.4 New Brunswick

The population of New Brunswick was estimated at 756,000 on July 1, 2012, remaining relatively stable over the previous year. The province's net international migration $(+2,200)$ was completely offset by negative net interprovincial migration $(-2,200)$. It should be noted that in 2011/2012, the province's net international migration was at a record level for the
period covered by the current demographic accounting system, that is, since 1971/1972.

### 1.1.10.5 Quebec

In 2011/2012, the population of Quebec increased by $76,800(+1.0 \%)$. It stood at $8,054,800$ on July 1, 2012. Two-thirds of the population increase in 2011/2012 for this province is attributable to net international migration (+51,700). Indeed, the province's net international migration was its highest since 1988/1989 (+53,700).

### 1.1.10.6 Ontario

In 2011/2012, Ontario saw its population increase by 139,600 or $+1.0 \%$, a growth rate very close to the national average (+1.1\%). On July 1, 2012, Ontario's population was estimated at $13,505,900$. The main factor in the increase of the province's population was net international migration, which stood at 102,100 for the last year.

### 1.1.10.7 Manitoba

The population of Manitoba grew by 15,300 (+1.2\%) in 2011/2012. On July 1, 2012, Manitoba's population was estimated at $1,267,000$. During the year, net international migration $(+14,200)$ was the main factor driving the province's growth. It was also the highest level observed in Manitoba for the period covered by the current demographic accounting system.

### 1.1.10.8 Saskatchewan

In 2011/2012, Saskatchewan saw its population grow by 22,200 or $2.1 \%$, a record increase for this province for the period covered by the current demographic accounting system. On July 1, 2012, Saskatchewan's population was estimated at 1,080,000. Net international migration $(+13,700)$ was the main factor behind the province's population growth, combined with positive net interprovincial migration $(+2,800)$, which was positive for a sixth consecutive year. For the year ended June 30, Saskatchewan was the only province along with Alberta to register gains in these migratory exchanges with other parts of Canada. It especially benefited from such exchanges with certain provinces, with net gains of 2,100 with Ontario and 600 with British Columbia.

### 1.1.10.9 Alberta

On July 1, 2012, the population of Alberta was estimated at $3,873,700$. The growth of Alberta's population in 2011/2012 was estimated at 95,700. This province's growth rate in 2011/2012 (+2.5\%) is more than twice as high as for Canada as a whole (+1.1\%). During this period, natural increase $(+29,500)$ was exceeded by net international migration $(+38,000)$ as the main factor driving population growth in Alberta compared with 2010/2011. Indeed, the province's net migration in 2011/2012 set a record as the highest level attained in the period covered by the current demographic accounting system. Over the past year, this province also posted sizable gains through interprovincial migration, which reached 28,200 , up sharply from $2010 / 2011(+8,400)$. These gains were mainly from exchanges with Ontario $(+10,700)$ and British Columbia $(+5,100)$.

### 1.1.10.10British Columbia

On July 1, 2012, the population of British Columbia was estimated at 4,622,600. In the last year, British Columbia saw its population grow by 46,000 (1.0\%). This rate is equal to the national rate and the rate observed in this province in 2010/2011. Net international migration $(+39,000)$ was the main factor behind the increase in this province's population. British Columbia also recorded migratory losses to other provinces totaling 4,600 in 2011/2012, the largest since $2001 / 2002(-8,600)$.

### 1.1.10.11Yukon

Yukon's population grew by $2.0 \%$ in 2011/2012 and was estimated at 36,100 on July 1, 2012.

### 1.1.10.12Northwest Territories

The population of the Northwest Territories declined $2.0 \%$ in 2011/2012, with a loss of 900 . On July 1, 2012, this territory's population was estimated at 43,300 . This decrease is mainly due to losses in interprovincial migration $(-1,500)$.

### 1.1.10.13Nunavut

On July 1, 2012, the population of Nunavut was estimated at 33,700 , up $0.4 \%$ in one year. The increase in Nunavut's population was mainly due to natural increase (+700).

## Section 2

## Population by age and sex

This section analyzes estimates of the population by age and sex for Canada, the provinces and territories on July 1, 2012.

### 2.1 National portrait

### 2.1.1 Population aging

In recent decades, one of the main changes related to Canada's age and sex structure is population aging. This phenomenon can basically be explained by fertility
below the replacement level in recent years, along with increasing life expectancy.

The following age-sex pyramid (Figure 2.1) illustrates the aging of Canada's population by comparing the age and sex structure of the Canadian population on July 1, 1982 and 2012. In particular, the pyramid shows the impact of the large cohort of baby boomers, born between 1946 and 1965, on Canada's age structure. The movement of the baby boomers through the age structure is especially apparent in this age-sex pyramid. Thirty years ago, the baby boomers were young adults in the 17 to 36 age range, whereas now they are in the 47 to 66 age range.

Figure 2.1
Age pyramid of population estimates as of July 1, 1982 and 2012, Canada

Population aging is a complex phenomenon that can be measured using several statistical indicators such as the median age and the proportion of the population aged 65 and over. The median age is the age that divides a population into two groups of equal size, one consisting of individuals above the median age and the other of individuals below it.

On July 1, 2012, the number of children (aged 0 to 14) was estimated at $5,663,200$ or $16.2 \%$ of the population, down 5.8 percentage points from 1982 (22.0\%). In turn, the number of persons aged 65 and over was estimated at $5,186,800$, representing $14.9 \%$ of the Canadian population. In the past 30 years, seniors' demographic weight has increased by 5.2 percentage
points. Between 1982 and 2012, the number of seniors has more than doubled (112.4\%), while the number of children has increased by only $2.5 \%$. Because it has thus grown faster, the number of persons aged 65 and over has been steadily approaching the number of children; the gap was only 476,000 in 2012 compared with 3.1 million in 1982. The aging of the population in Canada is bound to accelerate in the coming decades, as all members of the vast baby-boom cohort reach age 65. At that point, the proportion of persons aged 65 and over will exceed the proportion of children under 15 years of age. The most recent
projections show that seniors could account for more than one-quarter of the population by $2036 .{ }^{1}$

In 2012, one Canadian in two is at least 40 years of age. The median age of Canada's population has grown by 10.2 years in the past 30 years (see Chart 2.1). The median age is higher for women (41.0 years) than for men (39.0 years). This difference is explained by a persistent, although diminishing, gap in life expectancy in favour of females. The most recent data show that females' life expectancy was 83 years, compared with 79 years for males. ${ }^{2}$
2. Life expectancy, at birth and at age 65, by sex, Canada, provinces and territories. CANSIM Table 102-0512. Page visited on August 30, 2012.

Chart 2.1
Median age by gender, 1982 to 2012, Canada

Population aging does not affect all parts of the country in the same way. On July 1, 2012, the youngest populations in Canada generally resided in the territories, while the oldest lived in the Atlantic provinces. Newfoundland and Labrador was the place in Canada with the oldest population (44.2 years). Among the provinces, Alberta had the youngest population ( 36.1 years). Owing to higher fertility and lower life expectancy, Nunavut had the youngest population in Canada, with a median age of 24.7 years in 2012.

### 2.1.2 Five-year age group

Between 1982 and 2012, the age group showing the largest increase ( $+250.1 \%$ ) was the 85 and over group (Chart 2.2), going from 202,300 in 1982 to 708,100 in 2012. Following them was the population between 80 and 84 years of age ( $+168.6 \%$ ). The growing size of the oldest segment of the Canadian population is mainly due to the marked decrease in mortality at advanced ages. Four other age groups saw their numbers more
than double in 30 years: the 50 to 54 (+114.5\%), the 45 to 49 (+112.5\%), the 75 to 79 (+104.5\%) and the 55 to 59 (+103.7\%). Except for the 75 to 79, the strong increase in the size of these age groups is due to the presence of baby boomers, who comprise the largest cohorts in the history of Canada. From 1982 to 2012, three age groups saw their numbers decrease: the 15 to 19 ( $-5.7 \%$ ), the 20 to $24(-2.1 \%)$ and the 10 to $14(-1.8 \%)$. These
cohorts were born between 1988 and 2002, a period in which Canadian fertility was at its lowest levels, reaching a low of 1.49 children per woman at the turn of the 21st century. ${ }^{3}$
3. Crude birth rate, age-specific and total fertility rates (live births), Canada, provinces and territories. CANSIM table 102-4505. Page visited on August 30, 2012.

Chart 2.2
Demographic growth rate by age group between 1982 and 2012, Canada

Age group

### 2.1.3 Sex ratio

Aside from aging, the sex structure of the population is also changing (Chart 2.3). On July 1, 2012, in the Canadian population as a whole, there were an estimated 99 males per 100 females, the same ratio as in 1982. Males outnumbered females in the 0 to 14 and 15 to 39 age ranges, owing to the sex ratio at birth, which averages 105 males per 100 females. However, when people reach their fifties, the numbers of males start to fall slightly below the numbers of females, because of a higher male mortality rate. This gap widens at more advanced ages,
with the result that among persons aged 65 to 79, there were estimated to be 90 males per 100 females on July 1, 2012. This is nevertheless an increase compared with 1982, when for 100 females there were only 80 males. In the population aged 80 and over, there were an estimated 61 males per 100 females on July 1, 2012, compared with only 54 per 100 on July 1, 1982. In recent years, life expectancy gains have been more rapid for males than for females, and this has led to a gradual narrowing in the gap represented by the sex ratio.

Chart 2.3
Sex ratio by age group, 1982 and 2012, Canada

### 2.1.4 Children (under 15 years of age)

The proportion of children within the population continues to decline. On July 1, 2012, there were an estimated 5,663,200 children aged 0 to 14 in Canada, representing $16.2 \%$ of the total population. They accounted for $22.0 \%$ of the population in 1982. The most recent population projections show that the proportion of children aged 0 to 14 years could fall below $16.0 \%$ during the 2030s. They also show that between 2015 and 2021, the number of children will be surpassed by the number of seniors. The proportion of children varies from one part of Canada to another, peaking at the national level in Nunavut (31.7\%) and, among the provinces, in Saskatchewan (19.1\%) and Manitoba (18.8\%).

The recent rise in fertility has slightly increased the weight of children under five years of age in the population. As a result, on July 1, 2012, they constituted $5.5 \%$ of the Canadian population, up slightly from the historic low reached in 2005 (5.3\%). However, children under five are still proportionally less numerous than in 1982, when they comprised $7.3 \%$ of the total population.

### 2.1.5 Working-age population ( 15 to 64 years of age)

On July 1, 2012, the number of persons aged 15 to 64 was estimated at $24,030,500$ or $68.9 \%$ of the Canadian population. This proportion is 0.6 percentage points higher than in 1982. According to the most recent population projections, the proportion of the population that is of working age could gradually decline to $60 \%$ by the early 2030s, when the baby boomers will all have crossed the age 65 threshold. The proportion of persons of working age varies from one part of Canada to another, reaching its highest levels at the national scale in Yukon ( $73.5 \%$ ) and, among the provinces, in Alberta (70.6\%) and British Columbia (69.3\%).

The working-age population can be divided into two groups: the younger segment (aged 15 to 39) and the older segment (aged 40 to 64). On July 1, 2012, the younger segment comprised $49.0 \%$ of the working-age population. On the other hand, the older segment of the working-age population has exceeded the younger segment since 2005. In 1982, the younger segment of the working-age population comprised $64.1 \%$ of the population aged 15 to 64 .

### 2.1.6 Senior population (65 years and over)

The population aged 65 and over continues to grow. On July 1, 2012, the roughly 5,186,800 people aged 65 and over comprised $14.9 \%$ of the Canadian population (see Chart 2.4). In 1982, seniors comprised $9.7 \%$ of the population. The aging of the population in Canada is expected to accelerate between 2012 and 2031, when
all of the vast cohort of baby boomers will have reached age 65.

The proportion of persons aged 65 and over differs from one part of Canada to another, ranging from 3.3\% in Nunavut to $17.2 \%$ in Nova Scotia. The most recent projections show that by 2036, seniors could constitute more than one-fourth of the population. According to these same projections, seniors could outnumber children by 2017.

Chart 2.4
Proportion of population aged less than 15 years old and 65 years old and over, 1982 to 2036, Canada

Note: From 1982 to 2012, population estimates. From 2013 to 2036, Population Projections for Canada, Provinces and Territories, 2009-2036, medium-growth scenario (M1), Catalogue no. 91-520-X.

### 2.1.7 Very elderly population (80 years and over)

Having grown steadily, the population aged 80 and over was estimated at 1,426,900 on July 1, 2012. In 2012, this population comprised $4.1 \%$ of the Canadian population, compared with $1.9 \%$ in 1982. Demographic projections indicate that in 2036, $7.6 \%$ of Canadians could be 80 years of age or older.

Also, persons aged 80 or over account for an increasing share of the population aged 65 and over. On July 1, 2012, 27.5\% of the population aged 65 and over was aged 80 and over. This proportion was estimated at $19.2 \%$ in 1982 but could reach $32,0 \%$ toward 2036.

### 2.1.8 International comparisons

Population aging is a characteristic of the populations of most developed countries. Despite its aging, Canada's population is still younger than that of many countries in the Organisation for Economic Co-operation and Development (OECD). According to recent international data, ${ }^{4}$ the proportion of seniors in Canada remains below the proportions registered in Japan (24\%), Germany (21\%), France (17\%) and the United Kingdom (17\%). However, it is slightly higher than those recorded in Australia (14\%) and the United

[^10]States (13\%). Because of the sizable demographic weight of the baby boom cohort in Canada, the proportion of seniors could be higher than in other countries in the coming years.

### 2.1.9 Portrait of provinces and territories

### 2.1.10 Population aging

Population aging does not affect all parts of Canada in the same way. On July 1, 2012, Canada's younger
populations were found in the territories and in the Prairies, and the older populations in the Atlantic provinces (Table 2.1). The youngest populations in Canada were found in Nunavut (24.7 years) and the Northwest Territories (32.1 years), owing to higher fertility and lower life expectancy.

Text table 2.1
Population estimates, 1 age distribution and median age as of July 1, 2012, Canada, provinces and territories

|  | Population | 0 to 14 years | 15 to 64 years | 65 years and over | Median age |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | number |  | \% |  | years |

| Newfoundland and Labrador | 512,659 | 14.8 | 68.6 | 16.6 | 44.2 |
| Prince Edward Island | 146,105 | 15.7 | 67.9 | 16.4 | 42.6 |
| Nova Scotia | 948,695 | 14.5 | 68.4 | 17.2 | 43.4 |
| New Brunswick | 755,950 | 15.0 | 68.1 | 17.0 | 43.4 |
| Quebec | 8,054,756 | 15.5 | 68.3 | 16.2 | 41.5 |
| Ontario | 13,505,900 | 16.3 | 69.1 | 14.6 | 39.8 |
| Manitoba | 1,267,003 | 18.8 | 67.0 | 14.2 | 37.6 |
| Saskatchewan | 1,079,958 | 19.1 | 66.2 | 14.7 | 37.1 |
| Alberta | 3,873,745 | 18.3 | 70.6 | 11.1 | 36.1 |
| British Columbia | 4,622,573 | 14.8 | 69.3 | 15.9 | 41.4 |
| Yukon | 36,101 | 17.1 | 73.5 | 9.4 | 39.4 |
| Northwest Territories | 43,349 | 21.4 | 72.4 | 6.2 | 32.1 |
| Nunavut | 33,697 | 31.7 | 64.9 | 3.3 | 24.7 |

1. Preliminary postcensal estimates.

Note(s): Figures in percent may not add up to $100 \%$ as a result of rounding.

Not only do the Atlantic provinces have older populations, but those populations have aged more rapidly in the past 30 years (Chart 2.5). This is a trend that goes back a number of years; it is attributable to regional differences in demographic behaviours, in particular the change over time in fertility, which was first higher, then lower than the national average, and substantial losses with respect to interprovincial migration.

In 1982, the provinces and territories had a very different demographic profile with regard to population aging. The provinces whose populations had the highest median ages were British Columbia (31.0 years), Ontario (30.7 years), Quebec (30.0 years) and Manitoba ( 30.0 years). On the other hand, the province with the lowest median age was Newfoundland and Labrador (25.8 years).

Chart 2.5
Median age, 1982 and 2012, Canada, provinces and territories

Note: In 1982, Nunavut was included in the Northwest Territories.

### 2.1.11 Sex ratio

The populations of the provinces and territories differ not only in their age structure but also in their sex structure (Chart 2.6). In 1982, the places with
the highest sex ratios were Yukon and the Northwest Territories, with 112 males per 100 females, and among the provinces, Alberta, with 105 males per 100 females.

Chart 2.6
Sex ratio, 1982 and 2012, Canada, provinces and territories

Note: In 1982, Nunavut was included in the Northwest Territories.

Since 1982, the sex structure of the populations of the provinces and territories has changed, in part because of the population aging process. The proportion of males has declined throughout Canada except in Quebec and Manitoba. On July 1, 2012, it was once again the territories and Alberta that posted the highest sex ratios in Canada. The Northwest Territories ranked first with 108 males per 100 females, followed by Nunavut (105); these are both places with high fertility and a young population. Among the provinces, Alberta had the highest sex ratio (104), mainly because it too has a younger population; males outnumber females in the youngest populations. Finally, Prince Edward Island and Nova Scotia were the provinces with the lowest sex ratio (95) on July 1, 2012.

### 2.1.12 Provincial and territorial variations

### 2.1.12.1 Newfoundland and Labrador

On July 1, 2012, $16.6 \%$ of the population of Newfoundland and Labrador was aged 65 and over. Its median age, estimated at 44.2 years, was the highest in Canada. In the past 30 years, this province's median age has risen by 18.4 years, the largest increase in Canada. Thus, Newfoundland and

Labrador has gone from being the province with the lowest median age in 1982 to the one with the highest median age. This province combines low fertility with substantial migratory losses, two factors that contribute to population aging.

### 2.1.12.2 Prince Edward Island

The median age of Prince Edward Island's population stood at 42.6 years on July 1, 2012, while the proportion of its population that was aged 65 and over was estimated at $16.4 \%$. Among the Atlantic provinces, Prince Edward Island had the lowest median age and the lowest proportion of persons aged 65 and over. Also, $15.7 \%$ of the province's population was under 15 years of age, the highest proportion in the Atlantic region. Prince Edward Island is the province with the highest fertility in that region.

### 2.1.12.3 Nova Scotia

Nova Scotia had one of the oldest populations in Canada. The share of its population that was aged 65 and over was estimated at $17.2 \%$, the highest proportion in Canada. Also, its median age was 43.4 years, the second highest figure after

Newfoundland and Labrador. This situation is due both to lower fertility and to interprovincial migratory losses.

### 2.1.12.4 New Brunswick

On July 1, 2012, 17.0\% of the population of New Brunswick was aged 65 and over, the second highest figure in Canada. Its median age was estimated at 43.4 years, up 14.9 years since 1982. Like the other Atlantic provinces, New Brunswick has a fertility rate below the national average and losses in its migratory exchanges with the rest of Canada.

### 2.1.12.5 Quebec

The population of Quebec was slightly older than that of Canada as a whole. On July 1, 2012, 16.2\% of this province's population was aged 65 and over, while its median age was 41.5 years, the highest figures west of the Atlantic provinces. Quebec has continual migratory losses and a fertility rate that until recently was below the national average.

### 2.1.12.6 Ontario

Population estimates indicate that on July 1, 2012, Ontario had a slightly younger population than that of Canada as a whole. The median age of Ontario's population was 39.8 years, while the proportion of the population aged 65 and over was 14.6\%. Since 1982, this province's median age has risen by 9.1 years, an increase slightly lower than for Canada as a whole.

### 2.1.12.7 Manitoba

On July 1, 2012, 14.2\% of the population of Manitoba was aged 65 and over and its median age was estimated at 37.6 years. On the other hand, 18.8\% of this province's population was 0 to 14 years of age, the highest proportion for a province after Saskatchewan. Manitoba has had the lowest median age since 1982 (7.6 years) because of a fertility rate above the national average.

### 2.1.12.8 Saskatchewan

On July 1, 2012, Saskatchewan had the largest proportion of persons aged 0 to 14 of any province
(19.1\%). Also, $14.7 \%$ of this province's population was aged 65 and over and its median age was estimated at 37.1 years. The median age in Saskatchewan was down 0.3 years from the previous year. This situation is due to having the highest fertility of all the provinces and net international migration that has increased substantially in the past few years.

### 2.1.12.9 Alberta

Among the provinces, Alberta had the youngest population on July 1, 2012 . Its median age was 36.1 years, while its proportion of persons aged 65 years and over was estimated at $11.1 \%$, with both these figures being the smallest for any province. Moreover, Alberta had the highest proportion of working-age persons of any province (70.6\%). Alberta is characterized by high fertility and major gains from interprovincial migration

### 2.1.12.10British Columbia

On July 1, 2012, the median age of British Columbia's population was 41.4 years, while the proportion of persons aged 65 and over was estimated at $15.9 \%$, with both these figures being the highest west of Quebec. This situation is due to lower fertility and longer life expectancy.

### 2.1.12.11Yukon

On July 1, 2012, Yukon was the place in Canada with the largest proportion of working-age persons (73.5\%). This territory also had highest median age ( 39.4 years) and the largest proportion of persons aged 65 and over (9.4\%) of the three territories. Yukon stands out from the other two territories in that its fertility rate is closer to the national average.

### 2.1.12.12Northwest Territories

The Northwest Territories had the youngest population after Nunavut. Approximately one person in five (21.4\%) living in this territory was under 15 years of age, while only six persons in 100 (6.2\%) were aged 65 and over. The median age of the Northwest Territories population was estimated at 32.1 years. This territory has a fertility rate much higher than the national average, surpassed only by that of Nunavut.

### 2.1.12.13Nunavut

Nunavut has the youngest population in Canada. The median age of Nunavut's population (24.7 years) and its proportion of persons aged 65 and over (3.3\%) are by far the lowest in Canada. Furthermore, 31.7\% of
the population of Nunavut is under 15 years of age, a proportion almost twice the national average. Nunavut has the highest fertility in Canada, approximately two times higher than the national average.

1. Period from July 1 to June 30.

Note(s): Net international migration is final up to 2008/2009, updated for 2009/2010 and 2010/2011 and preliminary for 2011/2012.

## Methodology

This section describes the concepts, the data sources and the methodology used to produce the population estimates. Population estimates are produced to measure the population counts according to various characteristics and geographies between two censuses. The demographic estimates are the official population estimates at the national, provincial and territorial levels.

```
Specific information regarding age and sex distributions is provided in boxes.
```

## Population Estimates

## Estimates of the total population

## Types of estimates

Population estimates can be either intercensal or postcensal. Intercensal estimates are produced using counts from two consecutive censuses adjusted for census net undercoverage (CNU) ${ }^{1}$ (including adjustment for incompletely enumerated Indian reserves) and postcensal estimates. The production of intercensal estimates involves updating the postcensal estimates using the counts from a new census adjusted for CNU. ${ }^{1}$

Postcensal estimates are produced using data from the most recent census adjusted for $\mathrm{CNU}^{1}$ and the components of population growth. In terms of timeliness, postcensal estimates are more up-to-date than data from the most recent census adjusted for CNU, 1 but as they get farther from the date of that census, they become more variable.

## Levels of estimates

Updating population estimates between censuses entails the use of data from administrative files or surveys. The quality of population estimates therefore depends on the availability of a number of administrative data files that are provided to Statistics Canada by Canadian and foreign government departments. Since some components are not available until several months after the reference date, three kinds of postcensal estimates are produced preliminary postcensal (PP), updated postcensal (PR) and final postcensal (PD). The time lag between the reference date and the release date is three months for preliminary estimates and two to three years for final estimates. Though it requires more vigilance on the part of users, the production of three successive series of postcensal estimates is the strategy that best satisfies the need for both timeliness and accuracy of the estimates. All tables indicate the level of the estimates they contain.

## Calculation of postcensal population estimates

Population estimates - preliminary, updated and final - are produced by the component method. This method consists in taking the population figures from the most recent census, adjusted for census net undercoverage (CNU) ${ }^{1}$ (census undercoverage minus census overcoverage), and adding or subtracting the number of births, deaths, and components of international and interprovincial migration.

## A. Provincial / territorial estimates of total population

Population estimates are produced for the provinces and territories first; then they are summed to obtain an estimate of the population of Canada.

[^48]The component-method formula for estimating total provincial / territorial populations is as follows:
Figure 2
Component-method formula for estimating total population

| $\mathrm{P}_{(t+i)}$ | $=P_{(t)}+B_{(t, t+i)}-D_{(t, t+i)}+I_{(t, t+i)}-\left[E_{(t, t+i)}+\Delta T E_{(t, t+i)}\right]+\mathrm{RE}_{(\mathrm{t}, \mathrm{t}+\mathrm{t})}+\Delta \mathrm{NPR}_{(\mathrm{t}, \mathrm{t}+\mathrm{t})}+\Delta \mathrm{N}_{(\mathrm{t}, \mathrm{t}+\mathrm{i})}-\operatorname{Resid}_{(\mathrm{t}, \mathrm{t}+\mathrm{i})}$ <br> ere, for each province and territory: |
| :---: | :---: |
| $(\mathrm{t}, \mathrm{t}+\mathrm{i})$ | $=$ interval between times t and $\mathrm{t}+\mathrm{i}$; |
| $\mathrm{P}_{(t+\mathrm{i}}$ | $=$ estimate of the population at time $t+i$; |
| $\mathrm{P}_{(\mathrm{t})}$ | $=$ base population at time t (census adjusted for ( $\mathrm{CNU}^{1}$ ), or most recent estimate); |
| B | $=$ number of births; |
| D | $=$ number of deaths; |
| I | $=$ number of immigrants; |
| E | $=$ number of emigrants; |
| $\Delta T E$ | $=$ net temporary emigration; |
| RE | $=$ number of returning emigrants; |
| $\Delta N P R$ | $=$ net non-permanent residents; |
| $\Delta \mathrm{N}$ | $=$ net interprovincial migration; |
| Resid | $=$ residual deviation (for intercensal estimates). |

## B. Provincial / territorial estimates by age and sex

Postcensal population estimates by age and sex are produced by applying the component method to each age-sex cohort in the base population.

At age 0:

Figure 3
Component-method formula for estimating population at age 0
$\mathrm{P}_{(\mathrm{t}+1)}^{0}=\mathrm{B}_{(\mathrm{t}, \mathrm{t}+1)}-\mathrm{D}_{(\mathrm{t}, \mathrm{t}+1)}^{-1}+\mathrm{I}_{(\mathrm{t}, \mathrm{t}+1)}^{-1}-\left[\mathrm{E}_{(\mathrm{t}, \mathrm{t}+1)}^{-1}+\Delta \mathrm{TE}_{(\mathrm{t}, \mathrm{t}+1)}^{-1}\right]+\mathrm{RE}_{(\mathrm{t}, \mathrm{t}+1)}^{-1}+\Delta \mathrm{NPR}_{(\mathrm{t}, \mathrm{t}+1)}^{-1}+\Delta \mathrm{N}_{(\mathrm{t}, \mathrm{t}+1)}^{-1}-\operatorname{Resid}_{(\mathrm{t}, \mathrm{t}+1)}^{-1}$

## From 1 to 99 years:

Figure 4
Component-method formula for estimating population from age 1 to 99
$\mathrm{P}_{(\mathrm{t}+1)}^{\mathrm{a}+1}=\mathrm{P}_{(\mathrm{t})}^{\mathrm{a}}-\mathrm{D}_{(\mathrm{t}, \mathrm{t}+1)}^{\mathrm{a}}+\mathrm{I}_{(\mathrm{t}, \mathrm{t}+1)}^{\mathrm{a}}-\left[\mathrm{E}_{(\mathrm{t}, \mathrm{t}+1)}^{\mathrm{a}}+\Delta \mathrm{TE}_{(\mathrm{t}, \mathrm{t}+1)}^{\mathrm{a}}\right]+\mathrm{RE}_{(\mathrm{t}, \mathrm{t}+1)}^{\mathrm{a}}+\Delta \mathrm{NPR}_{(\mathrm{t}, \mathrm{t}+1)}^{\mathrm{a}}+\Delta \mathrm{N}_{(\mathrm{t}, \mathrm{t}+1)}^{\mathrm{a}}-\operatorname{Resid}_{(\mathrm{t}, \mathrm{t}+1)}^{\mathrm{a}}$

## C. Levels of estimates

The difference between preliminary ${ }^{2}$ and final postcensal population estimates lies in the timeliness of the components. When all the components are preliminary, the population estimate is described as preliminary postcensal (PP). When they are all final, the estimate is referred to as final postcensal (PD). Any other combination of levels is referred to as updated postcensal (PR).

## Base population and components of population growth

## A. Base population

The base populations are derived from the quinquennial censuses between 1971 and 2006. The population universe of the $2006^{3}$ Census includes the following groups:

- Canadian citizens (by birth or by naturalization) and immigrants with a usual place of residence in Canada;
- Canadian citizens (by birth or by naturalization) and immigrants who are abroad, either on a military base or attached to a diplomatic mission;
- Canadian citizens (by birth or by naturalization) and immigrants at sea or in port aboard merchant vessels under Canadian registry;
- persons with a usual place of residence in Canada who are claiming refugee status and members of their families living with them;
- persons with a usual place of residence in Canada who hold a Study Permit and members of their families living with them;

[^49]- persons with a usual place of residence in Canada who hold a Work Permit and members of their families living with them.

For census purposes, the last three groups in this list are referred to as non-permanent residents (NPR).
Foreign residents have not been enumerated since 1991. Foreign residents are persons who belong to the following groups:

- government representatives of another country attached to the embassy, high commission or other diplomatic body of that country in Canada, and members of their families living with them;
- members of the Armed Forces of another country who are stationed in Canada, and members of their families living with them;
- residents of another country visiting Canada temporarily (for example, a foreign visitor on vacation or on business, with or without a visitor's permit).

These base populations are adjusted as follows:

- adjustment of the population for census net undercoverage (CNU);
- addition of independent estimates for incompletely enumerated Indian reserves in 1991, 1996, 2001 and 2006;
- adjustment for early enumeration in 1991 and 1996 in parts of northern Quebec, Newfoundland and Labrador, the Yukon and the Northwest Territories;
- addition of estimates of NPRs in 1971, 1976, 1981 and 1986. Since 1991, NPRs are included in the census universe;
- estimation of the July 1 base population by addition or subtraction of the components of growth between Census Day and June 30.

Adjustment for census net undercoverage (CNU)
The adjustment for CNU is important. CNU is the difference between the number of persons who should have been enumerated but were missed (undercoverage) and the number of persons who were enumerated but should not have been or who were counted more than once (overcoverage).

Coverage studies provide undercoverage estimates for the 1991, 1996, 2001 and 2006 Censuses at the provincial and territorial levels, and for the 1971, 1976, 1981 and 1986 Censuses at the provincial level only. Estimates of overcoverage at the provincial and territorial levels are available only for the last four censuses (1991, 1996, 2001 and 2006). Overcoverage for previous censuses was estimated by assuming that the overcoverage-to-undercoverage ratio for each census between 1971 and 1986 was the same as in 1991. The CNU for the Yukon and the Northwest Territories prior to 1991 was estimated by assuming that the ratio between the CNU for each territory and the 10 provinces for each census between 1971 and 1986 was the same as in 1991.

For consistency, 1991 Census undercoverage and overcoverage were revised in 1998 to take into account the methodological improvements made in the 1996 Census coverage studies. This revision altered the CNU in all censuses between 1971 and 1986. Similarly, 1996 Census undercoverage and overcoverage were revised in 2003.

Various methods were used to produce the estimates of CNU by age and sex for 1991, 1996, 2001 and 2006. First, the national estimates of CNU based on the coverage studies by age and sex were smoothed. Then an Empirical Bayes regression model was used to generate provincial and territorial estimates of CNU by broad age groups, and a synthetic model produced estimates by single year of age. Lastly, two-way raking ${ }^{4}$ was used to ensure that the CNU estimates were consistent with the provincial and territorial CNU totals and the national estimates by age and sex.

For the 1971 to 1986 period, the CNU estimates by age and sex were simply prorated to the revised CNU estimates for the total population.

## B. Births and deaths

The numbers of births and deaths are derived directly from the vital statistics database of Statistics Canada's Health Statistics Division. Although Statistics Canada manages the National system of vital statistics, the central vital statistics registries of the provinces and territories are responsible for collecting and processing the information from those administrative files. Under provincial / territorial vital statistics statutes (or similar legislation), all live births and all deaths must be registered, and all provinces and territories provide the information to Statistics Canada.

The vital statistics universe closely parallels the census universe. Both universes include births and deaths of all Canadians, immigrants and non-permanent residents (NPR) and exclude foreign residents.

Vital statistics by province or territory of residence are used to produce our final estimates of births and deaths.
When there are no vital statistics, the number of births is estimated using fertility rates by mother's age. The number of deaths is estimated using mortality rates by age and sex. These methods are used to calculate preliminary ${ }^{2}$ estimates.

Special treatment for preliminary² estimates for Quebec and British Columbia.
Quebec and British Columbia provide their most recent estimates of births and deaths. The figures are used to produce preliminary ${ }^{2}$ estimates. For the final estimates, the two provinces' births and deaths are derived from the vital statistics compiled by Health Statistics Division.

If current vital statistics are unavailable for sex, the number of births by sex is derived by applying the latest birth distribution from vital statistics to the preliminary birth estimates.

If current vital statistics are unavailable by age and sex, the number of deaths by age and sex is derived by applying the mortality distribution from the last two years provided by vital statistics to the preliminary death estimates.

Levels of estimates
For information on the differences between preliminary ${ }^{2}$ and final estimates, see sections B. Births and Deaths, above.

## C. Immigration

Like the numbers of births and deaths, Canadian immigration statistics must be kept by law. In Canada, immigration is regulated by the Immigration and Refugee Protection Act (IRPA) of 2002. This statute superseded the Immigration Act, which was passed in 1976 and amended more than 30 times in the years thereafter. Citizenship and Immigration Canada (CIC) collects and processes immigrants' administrative files. It then provides Statistics Canada with information from Field Operational Support System (FOSS) files. The information is used to estimate the number and characteristics of people granted permanent resident status by the federal government on a given date. For Demography Division, the terms immigrant and permanent resident are equivalent.

[^50]An immigrant is a person who is not a Canadian citizen by birth, but has been granted the right to live in Canada permanently by Canadian immigration authorities. The number of immigrants does not include persons born abroad to Canadian parents who are only temporarily outside the country.

Immigrants are usually counted on or after the date on which they are granted permanent resident status or the right to live in Canada.

The number of immigrants by age and sex is derived from the Field Operational Support System (FOSS).
Levels of estimates
The difference between preliminary ${ }^{2}$ and final postcensal estimates lies in the timeliness of the source used to estimate this component. Since the FOSS file is continually being updated, new calculations are carried out each year to update the immigration estimates. Immigration estimates are preliminary the first year and final the following year.

## D. Net non-permanent residents

Like the numbers of births and deaths, Canadian immigration statistics must be kept by law. In Canada, the non-permanent residents (NPR) are regulated by the Immigration and Refugee Protection Act (IRPA) of 2002. This statute superseded the Immigration Act, which was passed in 1976 and amended more than 30 times in the years thereafter. Citizenship and Immigration Canada (CIC) collects and processes the administrative files of immigrants and NPRs in Canada. It then provides Statistics Canada with information from Field Operational Support System (FOSS) files. The information is used to estimate the number and characteristics of people granted non-permanent resident status by the federal government.

NPRs are persons who are lawfully in Canada on a temporary basis under the authority of a temporary resident permit, along with members of their family living with them. NPRs include foreign workers, foreign students, the humanitarian population and other temporary residents. The humanitarian population includes refugee claimants and temporary residents who are allowed to remain in Canada on humanitarian grounds and are not categorized as either foreign workers or foreign students. For Demography Division, the terms non-permanent resident and temporary resident are equivalent.

NPR estimates are based on the number of NPRs, not on the net. The number of people in CIC's administrative system is estimated on a specific date in each period of observation. First, the end-of-period number of NPR is estimated, and then the start-of-period number of NPR is subtracted from that estimate. That yields the net number of NPR.

Anyone who received non-permanent resident status prior to the observation date is counted. For refugee claimants, the date of their application is used. Permit holders and refugee claimants are excluded from the population if their permit has expired, if they receive permanent resident status, or if they are deported. In addition, refugee claimants are excluded if their file has been inactive for two years.

Since the FOSS file is continually being updated, the figures are recalculated for each new release period to update the estimates of the net number of NPR in Canada.

The net number of non-permanent residents by age and sex is derived from the Field Operational Support System (FOSS).
Levels of estimates
The difference between preliminary ${ }^{2}$ and final estimates lies in the timeliness of the source used to estimate this component. Since the FOSS file is continually being updated, the figures are recalculated for each new release period to update the estimates of the net number of NPRs. Non-permanent resident (NPR) estimates are preliminary the first year and updated the following year. They become final two to three years after the reference year, when all other components are also final.

## E. Emigration

The number of emigrants is estimated using data from the Office of Immigration Statistics, U.S. Department of Homeland Security, data collected by the Canada Child Tax Benefit (CCTB) program, and data from the T1 Family File (T1FF). ${ }^{5}$ The first source is used to estimate emigration to the United States. CCTB data are used to estimate emigration to other countries. The estimates of the number of child emigrants have to be adjusted because the CCTB is not universal and does not provide direct information on the number of adult emigrants. As a result, four adjustment factors are used to take into account:

- incomplete coverage due to a delay in the receipt and processing of the files of children eligible for the CCTB. Since it seems to take four years after the reference period for CCTB administrative files to become complete, the adjustment is made if the estimates are finalized after two years. The factor is derived from the two-year ratios of emigrant children based on two versions of the CCTB files;
- the program's partial coverage, that is, people who do not apply for the CCTB or are not eligible. This factor is obtained by comparing the estimated number of children in the population with the number of children in CCTB files;
- the differential propensity to emigrate between children who are eligible for the CCTB and children who are not. This factor is obtained by comparing the emigration rates of CCTB-eligible children with the rates for all children (aged 0 to 17). This factor is calculated for each province and territory and is based on the last three available years of T1FF;4
- the differential propensity to emigrate between adults and children. This factor generates the emigration rate for the population aged 18 and over. It is obtained by (1) calculating the average ratio over three years of the adult and child emigration rates based on T1FF4 data, (2) calculating the average ratio over three years of the adult and child emigration rates based on data from the Office of Immigration Statistics, U.S. Department of Homeland Security, and (3) taking the average of the two rates. This factor is calculated for Canada only.

The adult emigration rate is applied to the adult population to generate the number of adult emigrants, which is then added to the number of child emigrants to produce the number of emigrants for the entire population.

Emigration is disaggregated by province and territory based on the number of child emigrants adjusted for coverage and differential emigration.

Estimates of the number of emigrants by age and sex are obtained by disaggregating the broad age groups in the T1FF5 into five-year age groups based on data from the Office of Immigration Statistics, U.S. Department of Homeland Security, and disaggregating those estimates into single years of age using Sprague coefficients. The same distribution is used for all provinces and territories.

Levels of estimates
The difference between preliminary ${ }^{2}$ and final estimates lies in the timeliness of the sources used to estimate this component. The same estimation method is used.

[^51]
## F. Net temporary emigration

Some people leave Canada to live temporarily in another country; others who were temporarily outside Canada return. The net result of those departures and returns is the component known as "net temporary emigration". Estimates of the number of departures are derived from the Reverse Record Check (RRC), the most important census coverage study. The RRC provides an estimate of the number of people who left Canada temporarily during an intercensal period and are still out of the country at the end of the period. Estimates of the number of returns are based on two sources: the Census and Demography Division's estimates of returning emigrants. The census provides the number of people who were outside Canada at the time of the previous census and returned during the intercensal period. That number includes all returning emigrants. Then Demography Division's estimate of the returning emigrants' component is subtracted to produce the number of returning temporary emigrants. The estimated numbers of departures (RRC) and returns (Census and Demography Division) yield an estimate of net temporary emigration.

That estimate is for the whole intercensal period; it is disaggregated into estimates for each of the five years in the period and then into monthly estimates using a seasonal adjustment that is an average between zero seasonality and the seasonality of emigration.

Net temporary emigration is calculated first for the national level. It is then disaggregated by province or group of provinces based on the RRC estimates of temporary emigration. For the Atlantic provinces and the territories, the estimate for the group is disaggregated on the basis of each province / territory's proportion of the group's total population.

Net temporary emigration can be estimated only for the intercensal period preceding the most recent census. Net temporary emigration in the current period is assumed to be the same as in the previous period for each province and territory.

The emigration age and sex distribution is applied to obtain the age and sex structure of the net temporary emigration.
Levels of estimates
The difference between preliminary ${ }^{2}$ and final estimates lies in the timeliness of the emigration estimate used to calculate the seasonal adjustment for the net temporary emigration. The same estimation method is used.

## G. Returning emigrants

A returning emigrant is a person who returns to Canada after having been classified as an emigrant. In a manner similar to the procedure used to calculate the number of emigrants, data from the Canada Child Tax Benefit (CCTB) file and the Canada Revenue Agency's (CRA) T1FF4 are used to estimate the number of returning emigrants. Adjustment factors are applied to compensate for the fact that the CCTB program is not universal, and an adult/child ratio is used to estimate the number of adult returning emigrants. As a result, three adjustment factors are used to take into account:

- the program's partial coverage, that is, people who do not apply for the CCTB or are not eligible. This factor is obtained by comparing the estimated number of children in the population with the number of children in CCTB files;
- the differential propensity to emigrate between children who are eligible for the CCTB and children who are not. This factor is obtained by comparing the emigration rates of CCTB-eligible children with the rates for all children (aged 0 to 17). This factor is calculated for each province and territory and is based on the last three available years of T1FFs;4
- the adult / child ratio, which is based on the census used in estimating the base population.

The age and sex distribution of returning emigrants is based on Census of Canada data. Characteristics of returning emigrants are derived from census mobility data 1 year ago, after excluding non-permanent residents and immigrants. From 2006/2007, we are using distribution by age and sex derived from 2006 Census.

Levels of estimates
The difference between preliminary ${ }^{2}$ and final estimates lies in the timeliness of the sources used to estimate this component. The same estimation method is used.

## H. Interprovincial migration

Interprovincial migration represents movements from one province or territory to another, involving a change in usual place of residence. As is the case for emigration, there is no provision for recording interprovincial migration in Canada. Consequently, such movements have to be estimated using data from the Canada Child Tax Benefit (CCTB) of Canada Revenue Agency (CRA) and the T1FF. 4

Final estimates of interprovincial migration are obtained by comparing addresses indicated on personal income tax returns over two consecutive tax years. However, the migration status of taxfilers' dependants has to be imputed. An adjustment is also required to take into account migrants who do not file income tax returns. From 2001/2002 to 2005/2006, the adjustment was slightly modified (for further information, see Wilkinson, 2004). From 2006/2007, this adjustment has been slightly modified (Cyr, 2008 - Internal document).

Since income tax returns are not available at the time preliminary estimates are produced, the estimation of preliminary 2 interprovincial migration is based on CCTB administrative files, which provide counts of child migrants (aged 0 to 17) receiving benefits under the program. The estimates have to be adjusted later for children who are not receiving the CCTB. Finally, the number of adult migrants is calculated using the number of child migrants and factors derived from the T1FF. 4 As a result, three adjustment factors are used to take into account:

- the program's partial coverage, that is, people who do not apply for the CCTB or are not receiving benefits. This factor is obtained by comparing the estimated number of children in the population with the number of children in CCTB files;
- the differential propensity to migrate between children who are receiving the CCTB and children who are not. This factor is obtained by comparing the out-migration rates of children receiving the CCTB with the rates for all children (aged 0 to 17). This factor is calculated for each province and territory and is based on the last available year of T1FFs;4
- the differential propensity to migrate between adults and children. This factor generates the out-migration rate of the population aged 18 and over for each province / territory of origin and destination. It is obtained by calculating the ratio of the central migration rate for adults to the rate for children. It is estimated using data from the last three available years of T1FFs. 4

The adult migration rate is then applied to the estimated adult population. The number of adult migrants is then added to the number of child migrants to produce the number of interprovincial migrants for the entire population.

Interprovincial migration by age and sex is derived from T1FF5 data and counts from the last available census (1-year mobility variable). From 2006/2007, the 2006 Census age and sex distribution is used.

Levels of estimates
For information on the differences between preliminary 2 and final estimates of total interprovincial migration, see section H. Interprovincial migration above.

## Intercensal population estimates

Intercensal estimates - population estimates for reference dates between two censuses - are produced following each census. They reconcile previous postcensal estimates with the new census counts.

There are two main steps in the production of intercensal estimates:

- calculation of the error of closure;
- linear distribution of the error of closure.

Error of closure is defined as the difference between the postcensal population estimates on Census Day and the population enumerated in that census (after adjustment for census net undercoverage (CNU)). ${ }^{1}$

The error of closure is spread uniformly over the intercensal period of days within each month.
Intercensal estimates by age and sex are adjusted in the same way, i.e., by distributing the error of closure uniformly across the age-sex cohorts.

## Quality of demographic data

The estimates contain certain inaccuracies stemming from two types of errors:

- errors in the census data;
- imperfections in other data sources and the method used to estimate the components.

Specific information regarding age and sex distributions is provided in boxes.

## Census data

## A. Coverage, response and imputation errors

The errors attributable to census data can be divided into two groups: response and processing errors, and coverage errors. The first group implies non-response error, misinterpretation by respondents, incorrect coding and non-response imputation. Errors in the second group primarily result from undercoverage and, to a lesser extent, overcoverage. It should be noted that both types of errors are intrinsic to any survey data.

The coverage errors occur when dwellings and/or individuals are missed, incorrectly included (except for the 2006 Census, where people incorrectly included where not considered in the Census Overcoverage Study) or counted more than once. Following each census, Statistics Canada undertakes coverage studies to measure these errors. The main studies are the Reverse Record Check Survey (RRC) and the Census Overcoverage Study (COS). Based on these studies, estimates of census net undercoverage (CNU) (which is equal to the difference between undercoverage and overcoverage) are produced. Demography Division adjusts the population enumerated in the census by province and territory using these estimates.

When creating base populations, the Estimates Program corrects the census populations only for coverage errors. This correction, which is based on the findings of coverage studies, is primarily subject to sampling errors, and to a lesser extent, processing errors. Statistical tests indicate that coverage adjustments improve the quality of census data. The Estimates Program uses the estimates from coverage studies for the provinces and territories. However, given the size of the samples in these studies, estimates by age and sex are modelled. Furthermore, it is assumed that the coverage rates estimated for a province or territory apply to the regions within that geographic area. Prior to 1991, the Estimates Program used census data that was unadjusted for coverage errors. Coverage studies had been done to measure undercoverage, but none measured overcoverage. Following the decision to integrate a correction for the coverage to the enumerated population in 1991, the Program had to revise the population estimates for the period from 1971 to 1986. The correction is based on the findings of the coverage studies conducted during this period and on hypotheses regarding the ratio between the overcoverage and undercoverage levels based on the findings of subsequent coverage studies.

Nevertheless, the corrections to the census data due to CNU improved, in general, the quality of the estimates by compensating for the differential undercoverage by age, sex and by province/territory across censuses.

Text table 1
Estimated census net undercoverage, Canada, provinces and territories, 2001 and 2006 Censuses

| Geography | Census population | Census net undercoverage | $\begin{array}{r} \text { Incompletely } \\ \text { enumerated } \\ \text { Indian reserves } \end{array}$ | Adjusted population | Rate |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | A | B | C | $D=A+B+C$ | $(\mathrm{B}+\mathrm{C}) / \mathrm{D} * 100$ |

| Ontario | 11,410,046 | 436,349 | 15,960 | 11,862,355 | 3.81 |
| Manitoba | 1,119,583 | 30,903 | 110 | 1,150,596 | 2.7 |
| Saskatchewan | 978,933 | 21,231 | 581 | 1,000,745 | 2.18 |
| Alberta | 2,974,807 | 69,857 | 4,977 | 3,049,641 | 2.45 |
| British Columbia | 3,907,738 | 164,542 | 263 | 4,072,543 | 4.05 |
| Yukon | 28,674 | 1,423 | 0 | 30,097 | 4.73 |
| Northwest Territories | 37,360 | 3,295 | 0 | 40,655 | 8.1 |
| Nunavut | 26,745 | 1,256 | 0 | 28,001 | 4.49 |
| 20061 |  |  |  |  |  |
| Canada | 31,612,897 | 868,658 | 40,115 | 32,521,670 | 2.79 |
| Newfoundland and Labrador | 505,469 | 5,046 | 0 | 510,515 | 0.99 |
| Prince Edward Island | 135,851 | 1,903 | 0 | 137,754 | 1.38 |
| Nova Scotia | 913,462 | 24,558 | 0 | 938,020 | 2.62 |
| New Brunswick | 729,997 | 16,059 | 0 | 746,056 | 2.15 |
| Quebec | 7,546,131 | 60,751 | 16,600 | 7,623,482 | 1.01 |
| Ontario | 12,160,282 | 465,824 | 15,391 | 12,641,497 | 3.81 |
| Manitoba | 1,148,401 | 34,330 | 0 | 1,182,731 | 2.9 |
| Saskatchewan | 968,157 | 22,594 | 739 | 991,490 | 2.35 |
| Alberta | 3,290,350 | 111,353 | 7,272 | 3,408,975 | 3.48 |
| British Columbia | 4,113,487 | 121,551 | 113 | 4,235,151 | 2.87 |
| Yukon | 30,372 | 1,805 | 0 | 32,177 | 5.61 |
| Northwest Territories | 41,464 | 1,620 | 0 | 43,084 | 3.76 |
| Nunavut | 29,474 | 1,264 | 0 | 30,738 | 4.11 |

1. The levels and rates are based on the Reverse Record Check (RRC) and the Overcoverage Study and include non-permanent residents.

The adjustment also incorporates the results of a study on the estimates of the number of people living on incompletely enumerated Indian reserves to complete the corrections for coverage errors in the census. The results of the coverage studies contain mainly sampling errors.

These adjustments have a direct impact on:

- the error of closure and its distribution by age and sex within a province or a territory as well as by province/territory as the CNU1 and its distribution vary from one census to another;
- within-cohort consistency of population estimates. If for example, the male cohort in age group 0 to 4 in 1981 was tracked up to the 2001 Census (unadjusted for CNU) ${ }^{1}$ the age group 20 to 24 would be noticeably smaller in 2001 than the age group 15 to 19 in 1996. Since Canada receives many immigrants within these age groups, the opposite would be expected. However, only after adjustment for CNU, 1 the cohort size increases from 1996 to 2001.

Text table 2
Estimated census net undercoverage by age and sex, 2006 Census, Canada

|  | Census population | Census net undercoverage | Incompletely enumerated Indian reserves | Demographic adjustment | Adjusted population | Rate |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| All ages | 31,612,897 | 868,658 | 40,115 | 0 | 32,521,670 | 2.79 |

For further information regarding the main coverage studies, please see the following document on Statistics Canada's web site: 1996, 2001 and 2006 Census Technical Report on Coverage.

## Components

Errors due to estimation methodologies and data sources other than the census can also be significant.

## A. Births and deaths

Since the law requires the recording of vital statistics, the final estimates for births and deaths data meet very high standards. Nevertheless, since preliminary estimates are derived, they can be slightly different from final estimates.

## B. Immigration and non-permanent residents

With respect to immigrants and non-permanent residents, Citizenship and Immigration Canada (CIC) administers special data files on both of these components. Since immigration is controlled by law, data on immigrants and NPRs are compiled upon arrival in Canada. These data represent only "legal" immigration and exclude illegal immigrants. Thus, for the "legal" part of international movement into Canada, the data are considered to be of high quality. However, some biases such as the difference between the stated province of intended residence at the time of arrival and the actual province of residence, may persist. Finally, since information provided by the Visitor Data System (VDS) from (CIC) is not complete (age and sex of dependents, province of residence for certain groups of permit holders), estimates of NPRs are more prone to error than data on immigrants.

## C. Emigration, returning emigration and net temporary emigration

Of all the demographic components that are used in the population estimates program, these components are the most difficult to estimate with precision. Canada does not have a complete border registration system. While immigration and non-permanent residents (NPRs) are well documented by the federal government, Statistics Canada has always used indirect techniques for the estimation of the number of persons leaving the country. For this reason, available statistics regarding these three components have historically been of a lower quality than other components.

Estimates of the number of emigrants and returning emigrants are both derived using Canada Child Tax Benefit (CCTB) data provided by Canada Revenue Agency (CRA). Data are adjusted to take into account the incomplete coverage of the program and to derive the emigration and returning emigration of adults.

These adjustments and the delay in obtaining the data are the two main sources of errors. As current information on the number of persons living temporarily abroad does not exist, estimates are based on the Reverse Record Check (RRC) and the census. Estimates for the intercensal period, distributed equally among the five years, are maintained constant for the postcensal period. Moreover, assumptions were made to allow for the distribution of annual estimates to a quarterly level. Any geographical or quarterly variation may introduce error in the estimation of these components.

## D. Interprovincial migration

Since July 1993, preliminary2 interprovincial migration estimates have been based on Canada Child Tax Benefit (CCTB) files. Under this program, only $76 \%$ of children aged 0 to 17 at the Canada level were entitled to benefits on July 1, 2001. Consequently, preliminary CСТВ based estimates are subject to larger error than final estimates derived from Canada Revenue Agency (CRA) tax files.

## E. Level of detail of components

As a more detailed breakdown of the data introduces a greater risk of inaccuracy into the estimates, the possibility of error in the components is augmented by the method used to distribute the estimates by age and sex. It seems that, in general, the initial errors should be minimal where the distribution of annual estimates of births, deaths and immigrants is concerned, and more significant with regard to the distribution of other components (non-permanent residents, emigrants, returning emigrants, net temporary emigrants and interprovincial migrants). Finally, the size of error due to the age and /sex distribution may vary by period and errors in some components may have a greater impact on a given age group or sex.

## Quality assessment

In order to assess the quality of our estimates, two evaluation measures are used: precocity errors and errors of closure.

## A. Precocity error

The quality of preliminary estimates of components is analyzed using precocity errors. Precocity error is defined as the difference between preliminary and final estimate of a particular component in terms of its relative proportion of the total population for the relevant geographical area. It can be calculated for both population and component estimates.

Precocity error allows for useful comparisons between components, as well as between provinces and territories or geographical areas of different population size. Note that when compared to the total population for an area, the differences between preliminary and final estimates of the components are quite small. There are, however, differences in the amount of impact on the population estimates between components and between provinces and territories.

Generally speaking, net interprovincial migration yields the greatest precocity errors. This is likely the result of the use of different data sources for preliminary and final estimates. In most years and for most provinces/territories, births, deaths and immigration estimates yielded the smallest precocity errors. For immigration estimates, this reflects the completeness of the data source and the availability of data for the more timely preliminary estimates. In the case of births and deaths, small precocity errors can be explained by the use of a different method (method of ratios) for preliminary estimates

According to the analysis of the most recent precocity errors and assuming that the quality of the basic data remains constant, the present postcensal estimates should have an acceptable degree of reliability.

Precocity errors by age and sex are not currently available.

## B. Error of closure

The error of closure measures the exactness level of the final postcensal estimates. It can be defined as the difference between the enumerated population of the most recent census (after adjustments for census net undercoverage (CNU)) ${ }^{1}$ and the most current postcensal population estimates as of Census Day.

The error of closure comes from two sources: the relative differences in the amount of CNU1 between two censuses and errors in the components of demographic growth over the intercensal period. This can be calculated for total population estimates and for age, sex and marital status. With each 5-year intercensal period, the error of closure can only be calculated with the release of census data and estimates of CNU. 1

The error of closure can be calculated for total population estimates and for age and sex.

| 95 to 99 | 16 | 0.05 | 9 | 0.13 | 7 | 0.03 |
| 100+ | 1 | 0.02 | -1 | -0.12 | 2 | 0.05 |

By dividing the error of closure by the census population adjusted for CNU, 1 the differences are relatively small at the national level ( $0.16 \%$ for 2001 and $0.32 \%$ for 2006 ). At the provincial and territorial level, differences are understandably larger, since the estimates are also affected by errors in estimating interprovincial migration. Nevertheless, the provincial/territorial final postcensal estimates generally fall within $1 \%$ of the adjusted census population, except for the territories that falls within closer adjustments.
Text table 5
Error of closure of the estimates of population, Canada, provinces and territories, 2001 and 2006

|  | 2001 |  | 2006 |  |
| :---: | :---: | :---: | :---: | :---: |
|  | number | rate in percent | number | rate in percent |
| Canada | 49,948 | 0.16 | 105,352 | 0.32 |
| Newfoundland and Labrador | 11,381 | 2.18 | -1,137 | -0.22 |
| Prince Edward Island | 1,483 | 1.09 | 74 | 0.05 |
| Nova Scotia | 9,005 | 0.97 | -2,778 | -0.30 |
| New Brunswick | 4,587 | 0.61 | 3,404 | 0.46 |
| Quebec | -222 | 0.00 | 26,088 | 0.34 |
| Ontario | 11,288 | 0.10 | 50,173 | 0.40 |
| Manitoba | -1,035 | -0.09 | -5,396 | -0.46 |
| Saskatchewan | 16,017 | 1.60 | -3,061 | -0.31 |
| Alberta | 1,604 | 0.05 | -47,801 | -1.40 |
| British Columbia | -4,347 | -0.11 | 88,057 | 2.08 |
| Yukon | -360 | -1.20 | -979 | -3.04 |
| Northwest Territories | 497 | 1.22 | -875 | -2.03 |
| Nunavut | 50 | 0.18 | -417 | -1.36 |

Note(s): The error of closure is equal to the postcensal estimate (at the census date) minus the census count adjusted for census net undercoverage (including adjustment for incompletely enumerated indian reserves). The percentage is: error of closure, divided by the census count adjusted for census net undercoverage and incompletely enumerated indian reserves, multiplied by 100.

## Explanatory notes for the tables

Text table 1
Annual population estimates and factors of growth, provincial perspective

| Year | Population at beginning period | Natural increase | Net interprovincial migration | Net international migration | Total net migration | Total growth |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2006/2007 | PD | D | D | D | D | D |

| Modified since ${ }^{1}$ | 2007/2008 | 2008/2009 | 2010/2011 | 2006/2007 | 2006/2007 | 2006/2007 |

1. Modified since indicates the year from which the data were revised since the last release. Last year's data were not modified as they are released for the first time. Notes: D: Final estimates. PD: Final postcensal estimates. R: Updated estimates. PR: Updated postcensal estimates. P: Preliminary estimates. PP: Preliminary postcensal estimates.

Text table 2
Annual estimates of demographic components, provincial perspective

| Year | Birth | Death | Immigrant | Emigrant | Returning <br> emigrant | Net <br> temporary <br> emigrant | Net <br> non-permanent <br> resident | In-migrant |
| :--- | ---: | :--- | ---: | :--- | ---: | ---: | ---: | ---: | ---: |
| Out-migrant |  |  |  |  |  |  |  |  |

1. Modified since indicates the year from which the data were revised since the last release. Last year's data were not modified as they are released for the first time. Notes: D: Final estimates. R: Updated estimates. P: Preliminary estimates.

## Appendix A

## Glossary

Age
Age as of July 1.

## Ageing (of a population)

An increase in the number of old persons as a percentage of the total population.

## Average age

The average age of a population is the average age of all its members.

## Census coverage

Census net undercoverage: Difference between undercoverage and overcoverage.
Overcoverage: Number of persons who should not have been counted in the census or who were counted more than once.

Undercoverage: Number of persons who were intended to be enumerated in a census but were not.

## Cohort

Represents a group of persons who have experienced a specific demographic event during a given year. Thus, the married cohort of 2001 consists of the number of persons who got married in 2001. In the cast of births, persons born within a specified year are referred to as a generation.

## Components of demographic growth

Any of the classes of events generating population movement variations. Births, deaths and migrations are the components responsible for the variation since they alter either the total population or the age and sex of the population.

## Dependency ratio

The ratio of the combined population aged from 0 to 14 years old and the population aged 65 years and over to the population aged from 15 to 64 years old.

## Emigrant

Canadian citizen or immigrant who has left Canada to establish a permanent residence in another country.

## Error of closure

Difference between the postcensal estimate at the census date and the results of the census adjusted for census net undercoverage (including adjustment for incompletely enumerated Indian reserves).

## Generation

Unless otherwise specified, refers here to a group of persons born within a given period. The 2001 generation represents people born during the year 2001.

## Immigrant

Within the framework of this publication, the term immigrant refers to landed immigrant. An immigrant is a person who does not have Canadian citizenship but was granted the right by the immigration authorities to live in Canada on a permanent basis.

## International migration

International migration represents movement of population between Canada and a foreign country which involves a change in the usual place of residence. A distinction is made with regard to immigrants, emigrants, returning emigrants, net temporary emigrants and net non-permanent residents.

## Interprovincial migration

Interprovincial migration represents movement between provinces or territories involving a change in the usual place of residence. A person who takes up residence in another province or territory is an out-migrant with reference to the province or territory of origin and an in-migrant with reference to the province or territory of destination.

## Median age

The median age is an age " $x$ ", such that exactly one half of the population is older than " $x$ " and the other half is younger than " $x$ ".

## Natural increase

Variation in the population size over a given period as a result of the difference between the numbers of births and deaths.

## Net international migration

Net international migration is obtained according to the following formula: Immigrants + returning emigrants + net non-permanent residents - (emigrants + net temporary emigrants).

## Net interprovincial migration

Net interprovincial migration represents the difference between in-migrants and out-migrants for a given province or territory.

## Net non-permanent residents

Net non-permanent residents represent the variation in the number of non-permanent residents between two dates.

## Non-permanent residents

A non-permanent resident belongs to one of the five following groups:

- persons with a usual place of residence in Canada who are claiming refugee status;
- persons with a usual place of residence in Canada who hold a Study Permit;
- persons with a usual place of residence in Canada who hold a Work Permit;
- persons with a usual place of residence in Canada who hold Minister's permits (including extensions);
- all non-Canadian born dependants of persons claiming refugee status, or of persons holding study permits, work permits or minister's permits and living in Canada.

## Net temporary emigrant

Net temporary emigration represents the variation in the number of temporary emigrants between two dates. Temporary emigration includes Canadian citizens and immigrants living temporarily abroad who have not maintained a usual place of residence in Canada.

## Population

Estimated population and population according to the census are both defined as being the number of Canadians whose usual place of residence is within that area, regardless of where they happened to be on Census Day. Also included are any Canadians staying in a dwelling in that area on Census Day and having no usual place of residence elsewhere in Canada, as well as those considered non-permanent residents.

## Population estimate

(a) Postcensal: Population estimate produced by using data from the most recent available census adjusted for census net undercoverage (including adjustment for incompletely enumerated Indian reserves) and estimate of the components of demographic growth since that last census. This estimate can be preliminary, updated or final.
(b) Intercensal: Population estimate derived by using postcensal estimates and data adjusted for census net undercoverage (including adjustment for incompletely enumerated Indian reserves) of censuses preceding and following the year in question.

## Population growth or total growth

Variation of population size between two dates. It can also be obtained by summing the natural increase, total net migration and if applicable, substract residual deviation. It can be positive or negative.

## Precocity error

Difference between preliminary and final estimate in terms of its relative proportion of the total population for the relevant geographical area. It can be calculated for either population estimates or components of population growth.

## Rate

Refers to the ratio of the number of events estimated in a year $(t, t+1)$ to the average populations at the beginning and the end of the period. In this regard, births, deaths, immigration rates, etc are calculated. Generally, the rates are expressed in per 1,000.

Demographic growth rate or population growth rate: Ratio of population growth between the year $t$ and $t+1$, to the average population of both these years. The rate is generally expressed in per 1,000.

Overcoverage of population rate: The ratio of the number of persons who should not have been counted in the census or who were counted more than once to the total number of persons that should have been enumerated in the census. Generally, the rate is expressed in percentage.

Undercoverage of population rate:The ratio of the estimated number of persons not enumerated in the census (who were intended to have been enumerated) to the total number of persons that should have been enumerated in the census. Generally, the rate is expressed in percentage.

Census net undercoverage of population rate: The difference between the census undercoverage rate and the census ovecoverage rate.

## Residual deviation

Difference between demographic population growth calculated using intercensal estimates of population between two dates and that obtained by the sum of the components for the same period. This deviation results from the distribution (based on the number of days) of the error of closure between years within the quinquennial period.

## Returning emigrant

Canadian citizen or immigrant having previously emigrated from Canada and subsequently returned to the country.

## Sex ratio

The ratio of the number of men to the number of women. This is not to be confused with the sex ratio at birth, which is the ratio of the number of live-born boys to the number of live-born girls. This ratio is usually expressed as an index, with the number of females taken to be a base of 100 .

## Sprague coefficients

Series of factors which, when multiplied to a population distributed by multiples age groups, give a distribution of the same population by single years of age.

## Total net migration

Sum of net international and net interprovincial migration.

## Vital events

Includes all the demographic events (births, deaths, marriages and divorces) for which there exists a legal requirement to inform the Provincial or Territorial Registrar's Office.

## Year

Unless otherwise specified, the term "year" refers to the period beginning July 1 of a given year and ending June 30 of the following year.

## Appendix B

## Sources and remarks

## Base population

May 16, 2006 Census of Population adjusted for census net undercoverage and incompletely enumerated Indian reserves.

2006 Census: Statistics Canada, Census of Canada, 2006, Catalogue no. 92-200-X.
Census net undercoverage: See The Daily, September 29, 2008.
Incompletely enumerated Indian reserves: See The Daily, September 29, 2008.

## Births and deaths

Statistics Canada, Health Statistics Division.
Statistics Canada, Demography Division, catalogue no. 91-215-X, annual.
Births: $\quad$ Fertility rates for 2010 based on births by age of mother provided by Health Statistics Division applied to the female population estimates at the beginning of the quarter. Births for Quebec and British Columbia were provided by their respective agencies.

Deaths: Mortality rates for 2009 based on deaths by age group and sex provided by Health Statistics Division applied to the population estimates by age group and sex at the beginning of the quarter. Deaths for Quebec and British Columbia were provided by their respective agencies.

## Immigration

Estimates are based on the immigrant files provided by Citizenship and Immigration Canada (CIC) according to information made available on August 20, 2012.

## Emigration

The estimates are produced by Demography Division using:

- data from Canada Revenue Agency (CRA) Canada Child Tax Benefit files (CCTB). For 2010/2011 and 2011/2012, we used 2009/2010 data;
- tax data provided by the Income Statistics Division of Statistics Canada. For 2010/2011 and 2011/2012, we used 2009/2010 data;
- data provided by the U.S. Department of Homeland Security, Office of Immigration Statistics. For 2011/2012, we used 2010/2011 data;
- since CRA revised its identification procedure of returning emigrant children, we revised the emigrants in order to have a coherent series for the 2006/2007 to 2011/2012 period based on the 2012 data version. This revision also includes minor modifications made to the emigrant children by the CRA.

## Returning emigration

The estimates are produced by Demography Division using:

- data from Canada Revenue Agency (CRA) Canada Child Tax Benefit files (CCTB). For 2010/2011 and 2011/2012, we used 2009/2010 data;
- 2006 Census - 1 year mobility;
- CRA modified its identification procedures of returning emigrants children. In order to have a coherent series in the postcensal period, we revised the data from July 2006 based on data obtained in the 2012 version.

## Net temporary emigration

The estimates are produced by Demography Division using:

- data from the Reverse Record Check (RRC) of the 2006 Census;
- 2006 Census - 1 year mobility;
- estimates of returning emigration for 2001/2006 intercensal period;
- since CRA revised its identification procedure of returning emigrant children, we revised this estimate for the 2001 to 2006 period. These (unreleased) data allowed us to estimate new net temporary emigration for the postcensal period and gave us a coherent series for the 2006/2007 to 2011/20102 period based on data from the 2012 version.

## Non-permanent residents

The estimates are produced by Demography Division using Field Operational Support System files (FOSS) from CIC. These files, received on August 20, 2012, document the number of persons holding permits/authorizations or claiming refugee status.

## Interprovincial migration

The estimates are produced by Demography Division using:

- CCTB-based adjusted migration data for children;
- factors corresponding to the ratio of the migration rate of all children to the migration rate of eligible children calculated using 2010/2011 tax file data;
- factors used to calculate adult migration and corresponding to the ratio of the adult to child migration rates, calculated on a three-year basis using tax file data for 2008/2009, 2009/2010 and 2010/2011;
- children interprovincial migration data from July 2011 to March 2012 were revised for the following reasons:

Canada Revenue Agency (CRA) recently modified its definition of eligible children for the Canada Child Tax Benefit (CCTB). This change had an impact on the children origin-destination matrix which is the base of the total interprovincial migration method;
following discussions with CRA, it was decided to use a new source of data to adjust for the partial coverage of the CCTB. This report is part of the series of files received monthly and has the advantage of being created at the same time and by the same team as the children origin-destination matrix, offering a better coherence;

- these modifications had a minor impact :
the change in classification reduces the number of in and out migrants but has little impact on the monthly net migration;
the change of data source for CCTB coverage adjustment has very little impact on the estimates;
the combination of the 2 changes slightly reduces the number of in and out migrants but has little impact on the monthly net migration;
- following a modification in the age and sex distribution model, the interprovincial migration estimates where revised from 2006/2007. This modification does not affect the total estimate of this component.

[^0]:    2. For intercensal periods, total growth is not only made of natural increase and net international migration. It also includes residual deviation which is the difference between population growth calculated using censal estimates of population between two dates and that obtained by the sum of the component of growth for the same period.
    3. Including residual deviation.
[^1]:    4. Statistics Canada, Births, 2010, Catalogue no. 84F0210X.
[^2]:    5. Net emigration is obtained as follows: difference between emigration and returning emigration to which is added net temporary emigration.
[^3]:    1. Total growth is final up to 2008/2009, updated for 2009/2010 and 2010/2011 and preliminary for 2011/2012.
[^4]:    1. The number of deaths is final up to 2008/2009, updated for 2009/2010 and 2010/2011 and preliminary for 2011/2012.
[^5]:    1. The number of emigrants is final up to 2008/2009, updated for 2009/2010 and 2010/2011 and preliminary for 2011/2012.
[^6]:    1. The number of interprovincial migrants is final up to 2010/2011 and preliminary for 2011/2012.
[^7]:    1. Total growth is final up to 2008/2009, updated for 2009/2010 and 2010/2011 and preliminary for 2011/2012.
[^8]:    1. The net interprovincial migration is final up to 2010/2011 and preliminary for 2011/2012.
