# Introduction

Drug expenditure data in this publication was obtained primarily from the National Health Expenditure Database (NHEX) maintained by the Canadian Institute for Health Information (CIHI). This publication provides readers with highlights of total drug expenditure by source of funds (public and private sectors) and by type of drugs (prescribed and non-prescribed) at the provincial/territorial and national levels. International comparisons are also included. For more detailed information on the data, please see the Methodological Notes section.

## Highlights

### How much is total drug expenditure in Canada?

- Total drug expenditure is forecast to have reached \$32.0 billion in 2011 and \$33.0 billion in 2012, representing annual growth rates of 4.0% and 3.3%, respectively.
- The annual rate of change in total drug expenditure is at its lowest since 1996, and average annual growth in the past 10 years has been lower than growth over any other 10-year period dating back to 1985. This trend is due in part to patent expirations of blockbuster brand name drugs and the subsequent entry of lower-priced generic drugs used to treat common ailments like high cholesterol and hypertension, as well as the implementation of generic pricing policies by provincial drug programs.<sup>1-3</sup> (For a more comprehensive list of factors that may influence drug expenditure, see Appendix A.)
- Drugs' share of total health expenditure is forecast to have remained constant at 15.9% in both 2011 and 2012.
- Total drug expenditure per capita is expected to have reached \$927 in 2011 and \$947 in 2012, representing annual growth rates of 2.9% and 2.2%, respectively.

### What is the makeup of total drug expenditure in Canada?

- Prescribed drug spending is forecast to have made up 84.1% and 84.0% of total drug expenditure in 2011 and 2012, respectively.
- Expenditure on prescribed drugs is expected to have reached \$26.9 billion in 2011 and \$27.7 billion in 2012, representing annual growth rates of 3.8% and 3.2%, respectively.
- Expenditure on non-prescribed drugs is forecast to have reached \$5.1 billion in 2011 and \$5.3 billion in 2012, representing annual increases of 4.7% and 4.4%, respectively.

### What are the sources of finance for prescribed drug spending?

- Multiple payers (that is, provincial/territorial and federal drug subsidy programs and social security funds) are involved in the public-sector financing of prescribed drugs. In 2012, an estimated \$12.3 billion (44.5% of prescribed drug spending) was financed by the public sector, representing an annual growth rate of 1.9% (the lowest growth rate since 1996).

- In the private sector (which includes private insurers as well as households and individuals), spending on prescribed drugs is forecast to have reached \$15.4 billion in 2012, representing an annual growth rate of 4.1%.

### **How did drug expenditure vary provincially in 2012?**

- Total drug expenditure per capita is forecast to have ranged from \$736 in British Columbia and \$873 in Alberta to \$1,110 in New Brunswick and \$1,160 in Nova Scotia.
- Annual growth in total drug expenditure ranged from 2.3% in Prince Edward Island and 2.4% in Ontario to 4.1% in Alberta and 6.8% in Newfoundland and Labrador.
- The proportion of prescribed drugs financed by the public sector varied across the provinces; it is forecast to have ranged from 32.5% in New Brunswick and 34.5% in Newfoundland and Labrador to 49.3% in both Alberta and Saskatchewan.

### **How did drug expenditure in Canada compare with drug expenditure internationally in 2010?**

- Among seven comparator countries, Canada had the second-highest level of total drug expenditure per capita, after the United States (see the Methodological Notes section for a list of comparator countries).
- In Canada, average annual growth in total drug expenditure per capita, at constant 2005 Canadian dollars, between 2000 and 2010, was 3.9%. Canada was second behind Japan (4.0%) and just ahead of the United States (3.8%).
- The public sector funded 38.3% of total drug expenditure in Canada. This was the second-lowest share, ahead of that for the United States (31.7%). Germany had the highest share of public drug expenditure in total drug expenditure (76.4%).

# 1 Methodological Notes

## 1.1 Background

Drug expenditure data in this publication was obtained primarily from the National Health Expenditure Database (NHEX), which is maintained by the Canadian Institute for Health Information (CIHI). This database contains a historical series of macro-level health expenditure statistics by province and territory, beginning in 1975. Drug expenditure data in NHEX is macro-level data and does not allow for decomposition of spending by type (for example, drug costs versus professional fees) or drug class.

The Drugs category in NHEX is intended to measure final consumption, outside an institutional setting, of drugs purchased by consumers or third-party payers on their behalf, generally from community pharmacies. Drug expenditure data in NHEX consists of estimates that represent the final costs to Canadian consumers, which include dispensing fees, markups and appropriate taxes. NHEX data does not account for drug expenditure by non-Canadians (for example, Americans' purchases from Canadian pharmacies). The classification system employed is consistent with international standards developed by the Organisation for Economic Co-operation and Development (OECD).

### National Health Expenditure Database

The mandate of NHEX is twofold:

1. To support the development and evaluation of health programs in Canada by all levels of government and within the private sector.
2. To compile information on health expenditure that will accurately portray the importance of health care as a component of national expenditure.

**Health expenditure** includes any type of expenditure for which the primary objective is to improve or prevent the deterioration of health status.

This definition allows economic activities to be measured according to primary purpose and secondary effects. Activities that are undertaken with the direct purpose of improving or maintaining health are included. Other activities are not included, even though they may impact health. For example, housing and income support policies have social welfare goals as their primary purpose and are not considered health expenditure, yet they are recognized as powerful factors in determining population health.

## Source of Finance

National health expenditures are reported based on the principle of *responsibility for payment* rather than on the source of the funds. It is for this reason, for example, that federal health transfers to the provinces/territories are included in the provincial/territorial government sector, since it is the responsibility of provincial/territorial governments to expend federal transfers on health services. The exception to this principle is that provincial/territorial government health transfers to municipal governments are included in the provincial/territorial government sector. The following figure depicts the composition of total health expenditure by source of finance.

Figure 1: Composition of Total Health Expenditure, by Source of Finance\*

**Note**

- \* The remaining funds in the Quebec Drug Insurance Fund are financed through the Consolidated Revenue Fund; these expenditures are captured under the provincial government sector.

The **public sector** includes health care spending by governments and government agencies.<sup>i</sup> It is subdivided into *provincial government sector* and *other public sector*, as described below:

1. The *provincial government sector* includes health spending from provincial/territorial government funds, federal health transfers to the provinces/territories and provincial/territorial government health transfers to municipal governments.

i. Statistics Canada (Public Sector Statistics Division) publishes estimates of government health expenditure as part of its comprehensive reporting system of all government expenditure, the Financial Management System (FMS). The FMS public-sector health spending estimates are lower than those reported by CIHI because different classification methods are applied and a narrower definition of health expenditure is used in the FMS.

2. The *other public sector* includes the following:

- a. The *federal direct sector* refers to direct health care spending by the federal government in relation to health care services for special groups, such as Aboriginal peoples, members of the Canadian Forces and veterans, as well as expenditures for health research, health promotion and health protection. Federal direct health expenditure does not include federal health transfers to the provinces.
- b. *Municipal government sector* expenditure includes health care spending by municipal governments for institutional services, public health, capital construction and equipment, and dental services provided by municipalities in the provinces of Nova Scotia, Manitoba and B.C. Designated funds transferred by provincial governments for health purposes are not included in the municipal sector, as they are included with provincial government expenditure. Currently, no estimates of drug spending are included in this sector.
- c. *Social security funds* are social insurance programs that are imposed and controlled by a government authority. They generally involve compulsory contributions by employees, employers or both, and the government authority determines the terms upon which benefits are paid to recipients. Social security funds are distinguished from other social insurance programs, the terms of which are determined by mutual agreement between individual employers and their employees. In Canada, social security funds include health care spending by workers' compensation boards (WCBs) and the premium component of the Quebec Drug Insurance Fund.
  - Health spending by WCBs includes what the provincial boards commonly refer to as medical aid. Non-health related items often reported by the WCBs as medical aid expenditure—such as funeral expenses, travel and clothing—are removed.
  - On January 1, 1997, the government of Quebec created a basic drug insurance plan with the objective of ensuring that the population of Quebec has access to drugs as required by health status. All residents of Quebec must be covered by drug insurance, whether by private group insurance or by the public plan administered by the Régie de l'assurance maladie du Québec (RAMQ). At the beginning of the plan, the Drug Insurance Fund was the chosen mechanism to pay all drug and pharmaceutical service costs provided to subscribers<sup>ii</sup> insured by the RAMQ, as well as their children. Since July 1, 2002, the Drug Insurance Fund has also covered persons age 65 and older and social assistance recipients insured by the RAMQ. Accordingly, the public plan has been financed since then both by the expenditure allocated to this program by the Quebec government (provincial government sector) and by the amounts collected by the Drug Insurance Fund as premiums and proceeds (social security funds sector). The premiums are paid by the subscribers of the Quebec Drug Insurance Fund and by persons age 65 and older insured by this plan.

---

ii. Subscribers are defined as Quebec residents younger than age 65 who do not receive social assistance benefits and who do not have access to private group insurance.

The **private sector** includes health care spending by individuals and private sources as described below:

1. *Non-consumption* includes non-patient revenues received by health care institutions, such as donations and investment income, private spending on health-related capital construction and equipment, and health research funded by private sources. Currently, no estimates of drug spending are included in this portion of the private sector.
2. *Out of pocket* includes health expenditures made by individuals for health care goods and services.
3. *Private health insurance* includes health expenditure paid by commercial and not-for-profit insurance firms, as well as the cost of administering those claims.

## Hierarchy of Classification

National health expenditure in Canada is based on a system of classification that is consistent with international standards developed by the OECD for reporting health expenditure.

National health expenditure is grouped within the broad categories of personal health care or other health expenses:

- **Personal health care** consists of expenditure for health goods and services used by individuals.
- **Other health expenses** consist of expenditure on behalf of society, such as public health; expenditure made as investments for purposes of future consumption, such as capital expenditure; the administrative expenses of planning and managing the health care system; and research.

Personal health care expenditure is classified within categories that describe the type of health care used. Certain categories overlap. The hierarchy of classification that is used to allocate overlapping categories of expenditure is as follows:

- **Institutional setting:** Health care services consumed in hospitals or other institutions are allocated to the institutional categories if the institution purchased the services on behalf of its patients. For example, drugs paid for through hospital budgets are classified as hospital expenditure. This allocates expenditure to the supplier that was actually paid by patients or their agents in the form of government or insurance companies. It also reflects data availability.
- **Self-employed provider of service:** For example, all expenses of physicians' practices are considered expenditure for physician services, even though some of these expenses are for employment of other health professionals, drugs or personal health supplies.
- **Type of good or service:** Drugs and personal health supplies are examples.

One of the categories of health expenditure within NHEX is Drugs. Other categories include Hospitals, Other Institutions, Physicians, Other Professionals, Capital, Public Health and Administration, and Other Health Spending. In NHEX, these categories are also named "use of funds."

Below is a description of the Drugs category within NHEX; it is not a definition supplied by the OECD.

- **Drugs:** At the aggregate level, include expenditure on prescribed and non-prescribed drugs and other health products purchased in retail stores. Estimates represent the final costs to consumers, including dispensing fees, markups and appropriate taxes. The breakdown of prescribed drugs, over-the-counter drugs and personal health supplies in NHEX is parallel with the breakdown in the OECD. This category has been disaggregated at the Canada level in the data tables to provide information on the following subcategories:
  - *Prescribed drugs:* substances considered as drugs under the *Food and Drugs Act* and sold for human use as the result of a prescription from a health professional.
  - *Non-prescribed drugs.*<sup>iii</sup> include two sub-components: over-the-counter drugs and personal health supplies.
    - *Over-the-counter drugs:* therapeutic drug products not requiring a prescription.
    - *Personal health supplies:* include items used primarily to promote or maintain health; examples include oral hygiene products, diagnostic items such as diabetic test strips and medical items such as incontinence products.

The Drugs category in NHEX does not include drugs dispensed in hospitals and generally in other institutions. These are included in health expenditure figures for Hospitals and Other Institutions, respectively.

## International Comparisons: Data Comprehensiveness and Boundaries of Health Care

There are 30 countries with health expenditure information that most closely follows the health care boundary proposed in the OECD manual *A System of Health Accounts* (SHA). The SHA provides a comprehensive framework for reporting expenditures on the entire field of health care activities and proposes common functional boundaries of health care for international comparisons. However, member countries do not yet fully report comprehensive data; they may also include expenditures that fall outside the boundaries of health care as defined by the OECD.

In general, international comparisons should be interpreted with caution, as variation exists among countries with regard to reporting, inclusion and classification of health expenditure. Level of income, institutional characteristics and service delivery across countries also cause differences in the share of drugs in total health expenditure.

The OECD maintains a comparative database on health-related statistics, including health expenditure. This database captures information on expenditure for pharmaceuticals and other medical non-durables outside an institutional setting (equivalent to drugs purchased in retail establishments in Canada). Pharmaceutical and other medical non-durables include prescribed drugs, over-the-counter drugs and a wide range of medical non-durables such as bandages, elastic stockings, incontinence articles, condoms and other mechanical contraceptive devices.

---

iii. For more information on over-the-counter drugs and personal health supplies, see General Methods in Section 1.3 of the Methodological Notes.

To eliminate the differences in price levels between countries, purchasing power parities are used. To make useful comparisons of trends in drug expenditure per capita over time, it is necessary to deflate nominal drug expenditure through the use of a suitable price index to derive real spending per capita. Due to the unavailability of a specific pharmaceutical price index, the OECD uses the gross domestic product.

Drug expenditure data from 7 of the 30 OECD comparator countries is covered in the Highlights section: Australia, Canada, France, Germany, Japan, New Zealand and the United States.

## Other Terms

**Gross domestic product (GDP):<sup>4</sup>** The GDP implicit price index (in 1997 dollars) is used to compare the annual percentage change of drug expenditure with inflation in the Canadian economy. GDP is the unduplicated value of production originating within the boundaries of Canada, regardless of the ownership of the factors of production.

**Purchasing power parity (PPP):<sup>5</sup>** PPPs are the rates of currency conversion that equalize the purchasing power of different currencies. This means that a given sum of money, when converted into different currencies at the PPP rates, will buy the same basket of goods and services in all countries. Thus PPPs are the rates of currency conversion that eliminate differences in price levels between countries.

## 1.2 Data Limitations

Data contained in NHEX is estimated. The data is collected from diverse sources and includes varying classes of financial information. The data is collected and classified according to methods established by a review committee. CIHI's analysts and external experts continue to improve the comprehensiveness, accuracy and currency of the data to provide the most complete and objective estimates possible. Notwithstanding these improvements, national health expenditure data consists of estimates and should be used accordingly.

Most private-sector expenditure is estimated from survey data. Prior to 1996, the Family Expenditure Survey by Statistics Canada,<sup>6</sup> an important source of private-sector data, was not carried out annually; therefore, trend data was imputed for years between surveys. Private-sector data was revised following a methodology review in the early 1990s. The revised private-sector data incorporated information estimated directly from new sources for 1988 and subsequent years. Prior years were estimated using trend data. As a result, readers should use caution when using the private-sector expenditure data for small provinces and for years prior to 1988.

In 2010, the Survey of Household Spending (formerly the Family Expenditure Survey) underwent a major redesign by Statistics Canada. This affects out-of-pocket health expenditure in NHEX. See Section 1.3: Collection and Non-Response for more details.

## Drugs in Hospitals

NHEX uses a classification system that is consistent with international standards developed by the OECD for reporting health expenditure. Similar to the functional category Pharmaceutical and Other Medical Non-Durables in the OECD's SHA, the Drugs category in NHEX is intended to measure final consumption, outside an institutional setting, of drugs purchased by consumers or third-party payers on their behalf, generally from retail outlets. Drugs in hospitals are considered inputs (intermediate consumption) to the production of health care in hospitals. Consequently, drugs paid for through hospital budgets are not identified separately in NHEX but are classified as Hospitals expenditure. Similarly, drugs purchased by residential care facilities for their residents are classified as Other Institutions expenditure. All expenses of physicians' and dentists' practices, including drugs, are considered to be expenditure for physicians' and dentists' services, respectively. Some drug expenditure is also included in the NHEX category of Public Health (for example, vaccines). While the above hierarchy of classification is essential in allocating overlapping categories of expenditure, it also reflects data availability. For example, data on expenditure by provincial/territorial governments is usually extracted from provincial/territorial government public accounts. In the accounts, it is generally not possible to isolate drug spending from other categories of expenditure within program areas (for example, hospitals or public health). Although other possible data sources exist, the use of a single data source for the different categories of provincial government health expenditure—such as the provincial/territorial public accounts—has the major advantage of minimizing the risk of double counting.

## Measuring Drug Prices

There is no authoritative composite price index for all drugs sold in Canada. The difficulty lies in the fact that traditional statistical measurement considers the price of tablets or capsules rather than measuring the nature of the product itself (that is, its therapeutic properties). In pure economic terms, the price of a drug is the price per unit of health gain attained. From a practical perspective, however, people buy tablets, capsules or other forms of medication, some of which may contain multiple active ingredients.

There are several commonly accepted price indices that can potentially be used to measure shifts in drug prices at the retail level. These include the Consumer Price Index (CPI), the pharmaceutical component of the Industrial Product Price Index (IPPI [pharma]) and the Patented Medicine Price Index (PMPI). Each index is built upon a unique set of assumptions pertaining to inclusion criteria, definitions, updating and weighting methodologies. As a result, these indices produce differing results (Figure 2).

Figure 2: Industrial Product Price Index, Patented Medicine Price Index and Consumer Price Index, 1985 to 2012 (1987 = 100)

#### Notes

IPPI: Industrial Product Price Index.

PMPI: Patented Medicine Price Index.

CPI: Consumer Price Index.

#### Sources

Consumer Price Index and Industrial Product Price Index: Statistics Canada; Patented Medicine Price Index: Patented Medicine Prices Review Board.

## 1.3 Collection and Non-Response

The definitions and methods used to prepare this document are for the most part based on those adopted in 1994 by the National Health Expenditure Methodology Review Committee. This committee included representation from Health Canada, Statistics Canada, the ministère de la Santé et des Services sociaux du Québec, the Canadian Medical Association and the Canadian Healthcare Association.

## General Methods

The following is intended to be a general overview of the methods applied to calculate estimates of drug expenditure in Canada. More detailed information can be obtained by contacting the National Health Expenditures department by phone at 613-241-7860, by fax at 613-241-8120 or by email at [nhex@cihi.ca](mailto:nhex@cihi.ca).

## Provincial/Territorial Government

Provincial/territorial government expenditure principally includes drugs that are dispensed through provincial/territorial drug subsidy programs (see Appendix B). This drug expenditure data is extracted predominantly from audited and consolidated provincial/territorial documents detailing provincial government expenditure (Table 1).

Provincial/territorial government drug spending figures include spending by the provincial/territorial ministry responsible for health, as well as by other departments that may provide drug coverage. CIHI's estimates of provincial and territorial government drug expenditure were submitted to provincial and territorial departments of health for review and validation.

Provincial/territorial government figures identified as forecasts are based on the growth rates of major programs reported in provincial and territorial government main estimates and budgets.

Table 1: Provincial/Territorial Government Drug Expenditure Data

Province/Territory		Description
<b>Newfoundland and Labrador</b>	Drug Expenditure Data Source	Drug expenditure data is collected from the provincial <i>Public Accounts, Volume III: Consolidated Revenue Fund Supplementary Statements and Schedules</i> for three drug programs: indigents, seniors and the special drug programs.
<b>Prince Edward Island</b>	Drug Expenditure Data Source	The Drug Cost Assistance Program is reported under Provincial Pharmacy Program in the <i>Queens Region Health and Community Services Operating Statement</i> , which is reported in P.E.I.'s provincial <i>Public Accounts, Volume II</i> .
<b>Nova Scotia</b>	Drug Expenditure Data Source	Drugs data is extracted from three sources: the <i>Nova Scotia Estimates Supplementary Detail</i> ; special tabulations from the Nova Scotia Seniors' Pharmacare Program; and the Nova Scotia Department of Community Services, Income Assistance and Employment Support Services.
<b>New Brunswick</b>	Drug Expenditure Data Source	Drugs data is provided through special reports from the Department of Health and the Department of Social Development. A small component of drug expenditure by the provincial government is from the New Brunswick <i>Public Accounts, Volume 2</i> , under Payments to Vendors and Grants and Contribution Payments.
<b>Quebec</b>	Drug Expenditure Data Source	Provincial government expenditure is extracted from Volume 2 of the Quebec provincial public accounts. Spending on drugs by the provincial government is represented by total transfers of Program 5, RAMQ, for <i>médicaments et services pharmaceutiques</i> . See also the section below on social security funds and the Quebec Drug Insurance Fund.
<b>Ontario</b>	Drug Expenditure Data Source	Data is collected from Volume 1 of the <i>Public Accounts of Ontario</i> . Information is collected for the drug programs provided by the Ministry of Health and Long-Term Care (Ontario Drug Benefit Program, Trillium Drug Program and Special Drug Program) and by the Ministry of Community and Social Services, under Adult and Children's Service Program—Social Assistance and Employment.
<b>Manitoba</b>	Drug Expenditure Data Source	Data is from Manitoba Health's Pharmacare Program under the Health Services Insurance Fund. Data is also collected from the annual report of the Manitoba Department of Family Services under Income Assistance of the Employment and Income Assistance Program.
<b>Saskatchewan</b>	Drug Expenditure Data Source	Data sources include Saskatchewan's <i>Public Accounts, Volume 2</i> and the <i>Saskatchewan Health Annual Statistical Report for the Drug Plan and Extended Benefits Branch</i> . Data is collected for the Saskatchewan Prescription Drug Plan from the annual report. A total for the Supplementary Health Program (SHP) is also extracted from the annual report. The distribution of detailed expenditure of the SHP provided in the <i>Statistical Report for the Drug Plan and Extended Benefits Branch</i> is applied to the total for the SHP extracted from the public accounts. One of the components of the SHP that is also collected is non-formulary drugs. Drug expenditure amounts are collected under the Ministry of Social Services in the Supplier Payments section of the public accounts.

### Provincial/Territorial Government Drug Expenditure Data (cont'd)

Province/Territory		Description
<b>Alberta</b>	Drug Expenditure Data Source	<p>Drug expenditure data from Alberta Health and Wellness is extracted from its annual report. Detailed claims summary data is provided by Alberta Blue Cross Non-Group Benefits. The largest single expenditure component of Alberta Blue Cross Non-Group Benefits is drug benefits. The detailed claims distribution is applied to the total for Blue Cross Non-Group Benefits under Practitioner Services, extracted from the annual report of the Ministry of Health and Wellness.</p> <p>Drug expenditure information is also collected from Children's Services, the Department of Community Development and the Department of Human Resources and Employment. Drug expenditure amounts are compiled from various income assistance programs, including Income Support to Individuals and Families, Social Support to Individuals and Families, and Services to Persons With Disabilities.</p>
<b>British Columbia</b>	Drug Expenditure Data Source	Data is received in the <i>Financial Management Reports</i> (FMRs) from the Ministry of Health Services. Control totals for major programs are from the public accounts. With few exceptions, expenditure items from the FMRs sum to the control totals. The Ministry of Health administers drug subsidization for all targeted groups (seniors, income assistance recipients and families) under the Medical Services Program.
<b>Yukon</b>	Drug Expenditure Data Source	Control totals for major programs are extracted from Yukon's public accounts. Additional details are in a special tabulation provided by the territorial Ministry of Health and Social Services on spending for pharmacare (prescription drugs) under the Chronic Disease Program and Extended Health Benefits for Seniors.
<b>Northwest Territories</b>	Drug Expenditure Data Source	Drug expenditure data is provided by the Finance Division of the Department of Health and Social Services under the Extended Health Benefits of the Supplementary Health Programs.
<b>Nunavut</b>	Drug Expenditure Data Source	The government of Nunavut is unable to provide drug expenditure amounts to CIHI. To estimate expenditure in Nunavut, CIHI determined the proportion that drugs made up of the aggregate of individual programs in the Northwest Territories and allocated that proportion to the Supplementary Health Benefits Program in Nunavut.

### Federal Direct

Prescribed drug data is derived from information provided by federal government organizations, supplemented with information from the national public accounts. Federal government health care spending is generally provided according to the province in which the expenditure was made. Some data, however, is provided at the national level only; in these cases, it is distributed by the appropriate provincial or territorial population.

### Social Security Funds

Social security funds are financially autonomous social insurance schemes that are imposed and controlled by a government authority. They generally involve compulsory contributions by employees, employers or both, and the government authority determines the terms by which benefits are paid to recipients. Social security funds are distinguished from other social insurance programs, the terms of which are determined by mutual agreement between individual employers and their employees. In Canada, social security funds include the health care spending by WCBs and the premium component of the Quebec Drug Insurance Fund.

**Workers' compensation boards:** Prescribed drug expenditure for the WCBs and the Commission de la santé et de la sécurité du travail du Québec is collected through special tabulations from contacts in each provincial or territorial WCB.

**Quebec Drug Insurance Fund:** On January 1, 1997, the government of Quebec created a basic drug insurance plan with the objective of ensuring that the population of Quebec has access to drugs as required by health status. All residents of Quebec must be covered by drug insurance, whether by private group insurance or by the public plan administered by the RAMQ. At the beginning of the plan, the Drug Insurance Fund was the chosen mechanism to pay all drug and pharmaceutical service costs provided to subscribers<sup>iv</sup> insured by the RAMQ, as well as their children. Since July 1, 2002, the Drug Insurance Fund has also covered persons age 65 and older and social assistance recipients insured by the RAMQ. Accordingly, the public plan has been financed since then both by the expenditure allocated to this program by the Quebec government (provincial government sector) and by the amounts collected by the Drug Insurance Fund as premiums and proceeds (social security funds sector). The premiums are paid by the subscribers of the Quebec Drug Insurance Fund and by persons age 65 and older insured by this plan.

The premium component of the Quebec drug program is considered a social security scheme, while the remaining portion of the program, which is paid through the ministère de la Santé et des Services sociaux du Québec, is included as a provincial government expenditure.

### Private Sector

Private-sector drug data was revised in 1995 following a methodology review that began in the early 1990s. Private-sector data under the revised methodology incorporated information estimated directly from new sources for 1988 and subsequent years. Expenditure amounts prior to 1988 were estimated using trend data. Therefore, readers should exercise caution when using the private-sector expenditure data for small provinces and for years prior to 1988.

The recommendations pertaining to prescribed and non-prescribed drugs that were ultimately implemented included the following:

- Data on drug benefits paid by private insurers was to be estimated based on information provided by the Canadian Life and Health Insurance Association (CLHIA) and from surveys of non-profit insurers.
- Out-of-pocket expenditure on prescribed drugs was to be estimated from Statistics Canada's Family Expenditure Survey (FAMEX), renamed the Survey of Household Spending (SHS) in 1997.
- Non-prescribed drug estimates would include two components: over-the-counter drugs and personal health supplies. Estimates would be based on information from the market research firm The Nielsen Company.

---

iv. Subscribers are defined as Quebec residents younger than age 65 who do not receive social assistance benefits and who do not have access to private group insurance.

As part of the original agreement with the not-for-profit insurance firms that provide data to NHEX, the administrators of NHEX agreed to not report the components of the private sector—insurance and out-of-pocket expenditure—at the provincial/territorial level. The purpose was to protect the proprietary nature of the information of the not-for-profit insurance firms. Consequently, CIHI reports the private-sector sum of components by province and the out-of-pocket and insurance components separately at the national level.

The data sources and methodologies related to these recommendations are described below.

**Health insurance** drug claims paid are collected from nine not-for-profit insurance companies and the CLHIA. The CLHIA data is based on its survey of member companies. Currently, drug spending that may occur by insurance companies providing casualty insurance is not included in the estimates.

**Out-of-pocket** prescribed drug expenditure is based on purchased data from the SHS fielded by Statistics Canada. Specifically, average household costs associated with question 220, in Section PH of the SHS 2008 Questionnaire, relating to medicines, drugs and pharmaceutical products **prescribed by a doctor** are the basis of the estimates. The average household expenditure of prescribed drugs is multiplied by the number of estimated households reported in the survey.

The SHS is an annual survey that began in 1996. Prior to 1996, full surveys that included both urban and rural areas were carried out in 1986 and 1992. In 1990, a survey was conducted that included only metropolitan areas. For the years in which complete surveys were carried out, data is available for the 10 provinces and for 17 urban centres. Two of the urban centres, Yellowknife and Whitehorse, were used to derive estimates of expenditure in the territories. Metropolitan expenditure per household tends to be somewhat higher than provincial estimates. All relevant categories were updated in complete survey years. For the years in which only urban surveys were carried out, the percentage changes in urban expenditure within each province or territory were used to update category estimates from complete survey years. Between 1992 and 1996, when no surveys were conducted, historical provincial growth rates of the SHS variables of drug and drug sundries were used to impute missing years.

The non-prescribed drug estimate is based on data from the market research firm The Nielsen Company, which tracks consumer sales of non-prescribed drugs sold in Canada at retail outlets. Each year, The Nielsen Company reports retail sales data for two consistent years for more than 48 non-prescribed drug categories. Data is reported by sales channel,<sup>v</sup> total dollar sales volume and regional sales distribution for five regions that include nine provinces. Newfoundland and Labrador and the territories are not included. The data is processed by classifying the non-prescribed drug categories as either over-the-counter drugs or personal health supplies. Regional sales amounts are separated into nine provinces, and estimates for Newfoundland and Labrador and the territories are calculated using provincial distributions of “direct costs for health care” from the SHS. Appropriate provincial and federal sales taxes are incorporated into the estimates.

---

v. As a general rule, Statistics Canada's definitions govern the classification of stores by class of trade. Sales channels include drug stores; food stores with pharmacies; grocery banners; and mass merchandisers and warehouse clubs, which are estimated from The Nielsen Company's household panel data.

In 2010, the SHS underwent a major redesign by Statistics Canada: the reference period for prescribed drugs changed from 12 months to 3 months, and the result was annualized by multiplying by 4. One of the objectives of the redesign was to better adapt collection methods and reference periods. However, this methodology change caused a break in the series of out-of-pocket prescribed drug spending across the provinces. The 2010 growth rates of out-of-pocket prescribed drugs exceeded 30% for most provinces and were almost 50% in some provinces. To mitigate the impact of this change, a smoothing method was used. Also, spending on Other Professionals dropped the most compared with the other categories of out-of-pocket spending in most of the provinces in 2010. For these reasons, 2010 SHS data for prescribed drugs and other professionals was redistributed based on 2009 SHS proportions for these two categories.

Table 2 provides the various drug classes that are supplied to CIHI by The Nielsen Company. The choice of classes to be included in the non-prescribed drug expenditure estimate and the classification according to which drugs are included as over-the-counter drugs or personal health supplies was made by the NHEX Drug Expenditure Review Committee during the NHEX methodology review and adopted in 1995.

**Table 2: Drug Classes Supplied to CIHI by The Nielsen Company**

<b>Over-the-Counter Drugs</b>	<b>Personal Health Supplies</b>
Analgesic rubs	Adhesive bandages and dressing strips
Anti-fungals (external)	Antiperspirants
Athletes' foot products (included in anti-fungals in later years)	Artificial sweeteners Athletic supports/braces
Cold remedies	Condoms
Cough remedies	Contact lens preparations
Diarrhea remedies	Cotton swabs
Dietary aids	Cover and tape products
Headache remedies	Dental floss
Headache remedies—child's acetaminophen	Dentifrice
Hemorrhoidal remedies	Denture adhesives
Infant feeding products	Denture cleansers
Laxatives	Diabetic test strips
Medical nutritional supplements	Disposable diabetic syringes
Milk-intolerant products	Elastic bandages
Nasal preparations	Eye drops and lotions
Oral backache remedies	Feminine hygiene products
Pediculicides	Fever thermometers
Personal lubricants	Incontinence products
Premenstrual products	Medical supports/braces
Sleeping aids	Oral antiseptics
Throat remedies	Pregnancy test kits
Topical wound care	Sanitary pads
Upset stomach remedies	Selected hot/cold compresses
Vitamins—children's	Selected insoles
Vitamins—adults'	Tampons
Wart removers	Toothbrushes (includes denture brushes)

## Calculation Methods

### Calculation of Average Annual Rate of Growth

The average annual rate of growth is the constant annual rate necessary for a value at the beginning of a period to grow to a value at the end of a period over the number of compounding years in the period. The formula used to calculate the average annual rate of growth is

$$= \frac{\ln(\text{value at end of period}) - \ln(\text{value at beginning of period})}{T} - 1$$

Where the constant  $e$  equals 2.718, which is the base of the natural logarithm, and  $T$  equals the number of years in the period (that is, year at end of period minus year at beginning of period).

### Calculation of Calendar Year

Some information sources provide data in fiscal years. Calendar-year data was derived by adding three-quarters of one fiscal year to one-quarter of the following fiscal year.

### Calculation of per Capita Dollars

Per capita expenditure was calculated using the most recent revised population estimates and forecasts from the Demography Division of Statistics Canada. These take into account the results of the census adjustment for net census under-count, non-permanent residents and returning Canadians.

### Calculation of Total Health Expenditure

“Total health expenditure” refers to the sum of the public and private sectors. “Canada” refers to the sum of the 10 provinces and 3 territories. “Canada average” is the sum of provincial and territorial expenditure divided by the sum of provincial and territorial data of another variable, such as population.

### Forecasting Methods

Provincial government-sector drug spending forecasts are based on the growth rates of drug subsidy programs of provincial health departments reported in provincial main estimates and budgets. In the case of territorial government forecasts of the Northwest Territories and Nunavut, estimates were based on amounts reported in their main estimates. In other sectors, the figures for these two territories were calculated by developing a forecast for the Northwest Territories, including Nunavut. The share of Nunavut spending in the last year of actual data of the combined total of the Northwest Territories and Nunavut was used as a proxy to break out the forecasts for the Northwest Territories and Nunavut.

Forecasts for federal direct health care spending are based on information from the national public accounts and the Treasury Board of Canada’s Main Estimates. Forecasts for WCBs and the private sector were entirely based on econometric analysis of time series trends. For each series, up to 40 different univariate forecasting specifications were evaluated, and the best one

(based on the root mean square error of prediction) was selected. The functional forms studied included the exponential smoothing family (simple, double, Holt, Brown, Winters, damped trend, etc.), time trends and ARIMA specifications. Logarithmic transformations were used when the data warranted their use.

Forecasts of health expenditure are identified in the figure by special symbols and in the data tables by the letter *f*.

## 1.4 Sources of Data

Drug expenditure estimates from NHEX are compiled based on information from the following sources.

### **Provincial Government Sector**

- Provincial public accounts and main estimates
- Provincial departments of health annual reports and statistical supplements, where available
- Annual reports of various foundations, agencies and commissions
- Special tabulations and specific information from various provincial departments reporting health expenditure

### **Federal Direct Sector**

- Public Accounts of Canada
- Main Estimates of Treasury Board of Canada
- Special tabulations and information from
  - Health Canada
  - Veterans Affairs Canada
  - Department of National Defence
  - Solicitor General of Canada
  - Statistics Canada
  - Citizenship and Immigration Canada

### **Social Security Funds Sector**

- Special tabulations on medical aid spending provided by the provincial and territorial WCBs
- Annual reports of provincial and territorial WCBs
- Annual report of the RAMQ

## Private Sector

- Private insurance component:
  - The *not-for-profit* portion is captured from special tabulations provided by the not-for-profit insurance companies
  - The *commercial* portion is captured by a special tabulation provided by the CLHIA
- Out-of-pocket component:
  - SHS, Statistics Canada (formerly the FAMEX)
  - *Over-the-Counter Drugs and Personal Health Supplies—Market Review of Selected Drug Categories at Retail*, a special tabulation purchased from The Nielsen Company Canada

## Economic and Demographic Data

- Gross domestic product:
  - Purchased from Statistics Canada for all years except the latest
  - Purchased from The Conference Board of Canada (GDP growth rates) for the latest year
- Population—purchased from Demography Division, Statistics Canada
- Provincial government expenditure—special tabulation purchased from Public Institutions Division, Statistics Canada
- Price indices:
  - PMPI: from Patented Medicine Prices Review Board
  - CPI and Industrial IPPI: purchased from the Prices Division, Statistics Canada

**Series A—Expenditure on Drugs by Type,  
by Source of Finance and as a Share of Public,  
Private and Total Health Expenditure, Canada,

				Denmark	7.3			
				Norway	7.3			

**OECD****Notes**

\* The OECD proposes the following standard definition: Includes prescribed medicines and self-medication, often referred to as over-the-counter (OTC) products. Also includes other medical non-durables comprising a wide range of items such as bandages, elasticated stockings, incontinence articles, condoms and other mechanical contraceptive devices.

Excludes pharmaceutical consumption in hospitals.

Country-specific definitions differ from the OECD's proposed standard definition as follows:

- Greece: Excludes other medical non-durables.
- Hungary: Excludes subsidies from local governments.
- New Zealand: Includes cost of care provided in prison and military facilities; excludes subsidies from charitable not-for-profit organizations and regional and local governments.
- Norway: Public expenditure includes expenditure by hospitals and the National Insurance Administration (Rikstrygdeverket, RTV) only.
- Switzerland: Excludes other medical non-durables.
- Turkey: Includes pharmaceutical consumption in hospitals.

**Notes**

\* The OECD proposes the following standard definition: Includes prescribed medicines and self-medication, often referred to as over-the-counter (OTC) products. Also includes other medical non-durables comprising a wide range of items such as bandages, elasticated stockings, incontinence articles, condoms and other mechanical contraceptive devices.

Excludes pharmaceutical consumption in hospitals.

Country-specific definitions differ from the OECD's proposed standard definition as follows:

- Greece: Excludes other medical non-durables.
- Hungary: Excludes subsidies from local governments.
- New Zealand: Includes cost of care provided in prison and military facilities; excludes subsidies from charitable not-for-profit organizations and regional and local governments.
- Norway: Public expenditure includes expenditure by hospitals and the National Insurance Administration (Rikstrygdeverket, RTV) only.
- Switzerland: Excludes other medical non-durables.
- Turkey: Includes pharmaceutical consumption in hospitals.

† Converted to Canadian dollars (CAD) using purchasing power parities (PPPs) for gross domestic product (GDP). Canadian data reported by the OECD is as of November 2011.

In November 2012, updated and revised Canadian data was released in Canada. This updated information will not be incorporated into the OECD database until the summer of 2013.

# Appendix A: Factors That May Influence Drug Use and Expenditure in Canada

## Prices

- Unit prices of drugs (both patented and non-patented)
- Retail and wholesale markups and professional fees
- Availability of generics
- International prices
- Inflation

## Volume of Drug Use

- Population-related
  - Population size
  - Population structure/distribution
  - Age, gender and ethnicity
  - Health status of a population
  - Emergence of new diseases
  - Epidemics
  - Prevalence and severity of disease
- System-related
  - Changes and transition associated with health system reform
  - Availability of and access to third-party insurance coverage
  - Policies and programs
  - Extent of formulary listings
  - Eligibility and copayments
- Research- and technology-related
  - New treatment approaches
  - Drugs replacing surgery
  - Drug therapy for previously untreatable or undertreated diseases
  - Availability of more and/or improved diagnostic technology
  - Outcomes research, evidence-based preventive or curative approaches in diagnosis or treatment
  - Use of programs and technology in monitoring patients

- Pharmaceutical industry
  - Entry of new drugs
  - Development of new formulations (for example, new strengths, forms and presentations of existing drugs)
  - Promotion of drugs to physicians
  - Drug sampling
  - Direct-to-consumer advertising
- Practice- and people-related (health care providers and consumers)
  - Prescribing and dispensing practices
  - Number and mix of prescribers (specialists, general practitioners, nurse practitioners and others)
  - Consumers' expectations and behaviours
  - Adherence to treatment

## Appendix B: Comparison of Provincial and Territorial Drug Subsidy Programs

Table 3 gives an overview of provincial and territorial drug subsidy programs as of December 31, 2012. The table was verified for accuracy with provincial/territorial programs. Information is also available from the following websites:

	Rare Diseases Drug Program	Residents with extremely rare genetic disorders (Gaucher's disease, Fabry disease, MPS-I, Hunter disease and Pompe disease) may be eligible for rare disease drugs via Alberta Health Services	None	None	None	N/A

Table 3: Comparison of Provincial and Territorial Drug Subsidy Programs as of December 2012 (cont'd)

Province/ Territory	Program/ Plan	Beneficiary	Premium	Deductible	Copay	Maximum Annual Copay
Saskatchewan <sup>†</sup>	Saskatchewan Drug Plan—Special Support Program	All residents with Saskatchewan health coverage (application required)	None	Income-tested (annual threshold based on 3.4% of adjusted family income)	Income-tested (based on benefit drug costs, to help spread cost out evenly over the year)	N/A
	Seniors' Drug Plan	Saskatchewan residents 65 and older. Individual annual net income must be below the limit for the federal age credit to be eligible for the cap of \$20 per prescription (application required to determine eligibility).	None	None	Maximum \$20 per prescription	N/A
	Seniors Income Plan Recipients (Basic Deductible Programs)  Note: May also apply for the Seniors' Drug Plan and the Special Support Program	Seniors receiving the Seniors Income Plan supplement or receiving the federal Guaranteed Income Supplement and residing in a special care home	None	\$100 semi-annual family deductible	35% consumer copayment after deductible has been paid	N/A
		Seniors receiving the Guaranteed Income Supplement and living in the community	None	\$200 semi-annual family deductible	35% consumer copayment after deductible has been paid	N/A
	Emergency Assistance Program	Residents who require immediate treatment with covered prescription drugs who are unable to cover their share of the cost. This is a one-time benefit, and individuals are encouraged to apply for income-tested coverage for future assistance.	None	None	The level of assistance provided is in accordance with the consumer's ability to pay	N/A

**Note**

† To be eligible for drug plan coverage, the resident must not be covered under another provincial or federal government program, such as the Non-Insured Health Benefits Program. For all residents who are eligible for more than one drug plan program, the best coverage for each prescription will be applied.

Table 3: Comparison of Provincial and Territorial Drug Subsidy Programs as of December 2012 (cont'd)

Province/ Territory	Program/ Plan	Beneficiary	Premium	Deductible	Copay	Maximum Annual Copay
<b>Saskatchewan<sup>†</sup></b>	Family Health Benefits	Eligibility is established by the Ministry of Social Services, based on the number of children in the family and the family's annual income	None	\$100 semi-annual family deductible	No charge for benefit prescriptions for children; 35% consumer copayment after deductible has been paid for adult benefit prescriptions	N/A
	Supplementary Health	Persons nominated by Saskatchewan Social Services for special coverage (persons on social assistance, wards, inmates, etc.)	None	None	Up to \$2 per prescription (some drugs covered at no charge; individuals younger than 18 and certain other categories receive benefit prescriptions at no charge)	N/A
	Saskatchewan Aids to Independent Living (SAIL)	Persons registered under the following SAIL programs receive formulary and approved non-formulary drugs at no charge: Paraplegia Program, Cystic Fibrosis Program and Chronic End-Stage Renal Disease Program	None	None	None	N/A
	Palliative Care Program	Residents who are in the late stages of a terminal illness	None	None	None	N/A

**Note**

<sup>†</sup> To be eligible for drug plan coverage, the resident must not be covered under another provincial or federal government program, such as the Non-Insured Health Benefits Program. For all residents who are eligible for more than one drug plan program, the best coverage for each prescription will be applied.

Table 3: Comparison of Provincial and Territorial Drug Subsidy Programs as of December 2012 (cont'd)

Province/ Territory	Program/ Plan	Beneficiary	Premium	Deductible	Copay	Maximum Annual Copay
<b>Saskatchewan<sup>†</sup></b>	Children's Insulin Pump Program	Type 1 diabetic children (younger than 18) who require pumps to adequately stabilize blood sugar levels who are not eligible for benefits under a federal government program (such as the Non-Insured Health Benefits Program)	None	None	No charge for insulin pump. Insulin pump supplies subject to coverage (family deductible/copay).	N/A
	Children's Drug Plan	Children 14 and younger	None	None	Maximum \$20 per prescription	N/A
<b>Manitoba</b>	Pharmacare	All provincial residents who are eligible for benefits under <i>The Prescription Drug Cost Assistance Act</i>	None	2.81% to 6.36%, based on total adjusted family income. Credit of \$3,000 for a spouse and each dependant younger than 18.	None	N/A
	Employment and Income Assistance Program	Individual Manitobans who are receiving drug benefits pursuant to the Employment and Income Assistance Program	None	None	None	N/A
	Personal Care Home/Nursing Home	Manitoba residents of personal care homes	None	None	None	N/A
