Canadian Data Report of Fisheries and Aquatic Sciences

Data reports provide a medium for filing and archiving data compilations where little or no analysis is included. Such compilations commonly will have been prepared in support of other journal publications or reports. The subject matter of data reports reflects the broad interests and policies of the Department of Fisheries and Oceans, namely, fisheries and aquatic sciences.

Data reports are not intended for general distribution and the contents must not be referred to in other publications without prior written authorization from the issuing establishment. The correct citation appears above the abstract of each report. Data reports are abstracted in *Aquatic Sciences and Fisheries Abstracts* and indexed in the Department's annual index to scientific and technical publications.

Numbers 1 - 25 in this series were issued as Fisheries and Marine Service Data Records. Numbers 26 - 160 were issued as Department of Fisheries and the Environment, Fisheries and Marine Service Data Reports. The current series name was introduced with the publication of report number 161.

Data reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page. Out-of-stock reports will be supplied for a fee by commercial agents.

Rapport statistique canadien des sciences halieutiques et aquatiques

Les rapports statistiques servant à classer et à archiver les compilations de données pour lesquelles il y a peu ou point d'analyse. Ces compilations auront d'ordinaire été préparées à l'appui d'autres publications ou rapports. Les sujets des rapports statistiques reflètent la vaste gamme des intérêts et des politiques du ministère des Pêches et des Océans, c'est-à-dire les sciences halieutiques et aquatiques.

Les rapports statistiques ne sont pas destinés à une vaste distribution et leur contenu ne doit pas être mentionné dans une publication sans autorisation écrite préalable de l'établissement auteur. Le titre exact paraît au-dessus du résumé de chaque rapport. Les rapports statistiques sont résumés dans la revue *Résumés des sciences aquatiques et halieutiques*, et ils sont classés dans l'index annuel des publications scientifiques et techniques du Ministère.

Les numéros 1 à 25 de cette série ont été publiés à titre de relevés statistiques, Services des pêches et de la mer. Les numéros 26 à 160 ont été publiés à titre de rapports statistiques du Service des pêches et de la mer, ministère des Pêches et de l'Environnement. Le nom actuel de la série a été établi lors de la parution du numéro 161.

Les rapports statistiques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre. Les rapports épuisés seront fournis contre rétribution par des agents commerciaux.

ABSTRACT

Morris, J. F. T., Trudel, M., Thiess, M. E., Zubkowski, T. B., Boyle, C. A., and MacLean, H. R. 2007. CCGS *W.E. Ricker* Gulf of Alaska salmon survey, February 28 - March 27, 2006. Can. Data Rep. Fish. Aquat. Sci. 1191: 73 p.

The Highseas Salmon program of Fisheries and Oceans Canada conducted a survey of Pacific salmon in the Gulf of Alaska from February 28 to March 27, 2006. The objectives of the surveys were to (1) evaluate the distribution and ecology of juvenile Pacific salmon (*Oncorhynchus spp.*) during their first year in the ocean, (2) describe the ambient oceanographic conditions, and (3) quantify the biomass of zooplankton. Fish, oceanographic, and zooplankton sampling was conducted at stations from Swiftsure Bank on the west coast of Vancouver Island in British Columbia to Frederick Sound in Southeast Alaska (57.25° N).

A total of 880 Pacific salmon were caught on the survey, including: 367 age 0.1 juvenile chum (*O. keta*) in their first winter at sea; 30 age 0.1 juvenile pink (*O. gorbuscha*); 4 age X.1 juvenile sockeye (*O. nerka*); 52 age X.1 juvenile coho (*O. kisutch*); and 376 juvenile chinook (*O. tshawytscha*) between 100 to 350 mm in forklength. Juvenile coho were caught mostly on the shelf and within the inlets on the west coast of Vancouver Island, which was consistent with the distributions from this program's previous winter surveys. Juvenile chinook that ranged from 100 to 200 mm in forklength, that were most likely ocean ecotypes (age 0.1), were caught exclusively within the inlets and on the shelf on the west coast of Vancouver Island. Juvenile chinook that ranged from 200 to 350 mm in forklength were caught primarily off the west coast of Vancouver Island and in Sumner Strait in Southeast Alaska. Juvenile pink, chum, and sockeye were generally caught at low rates at scattered stations on the survey, but 359 juvenile chum were caught on one tow in southwestern Hecate Strait.

Of the 18 chinook with CWT's that were recovered on the survey, 8 were ocean ecotypes (age 0.1) that ranged in fork length from 210 to 274 mm, and 7 were stream ecotypes (age 1.1) that ranged in fork length from 270 to 381 mm.

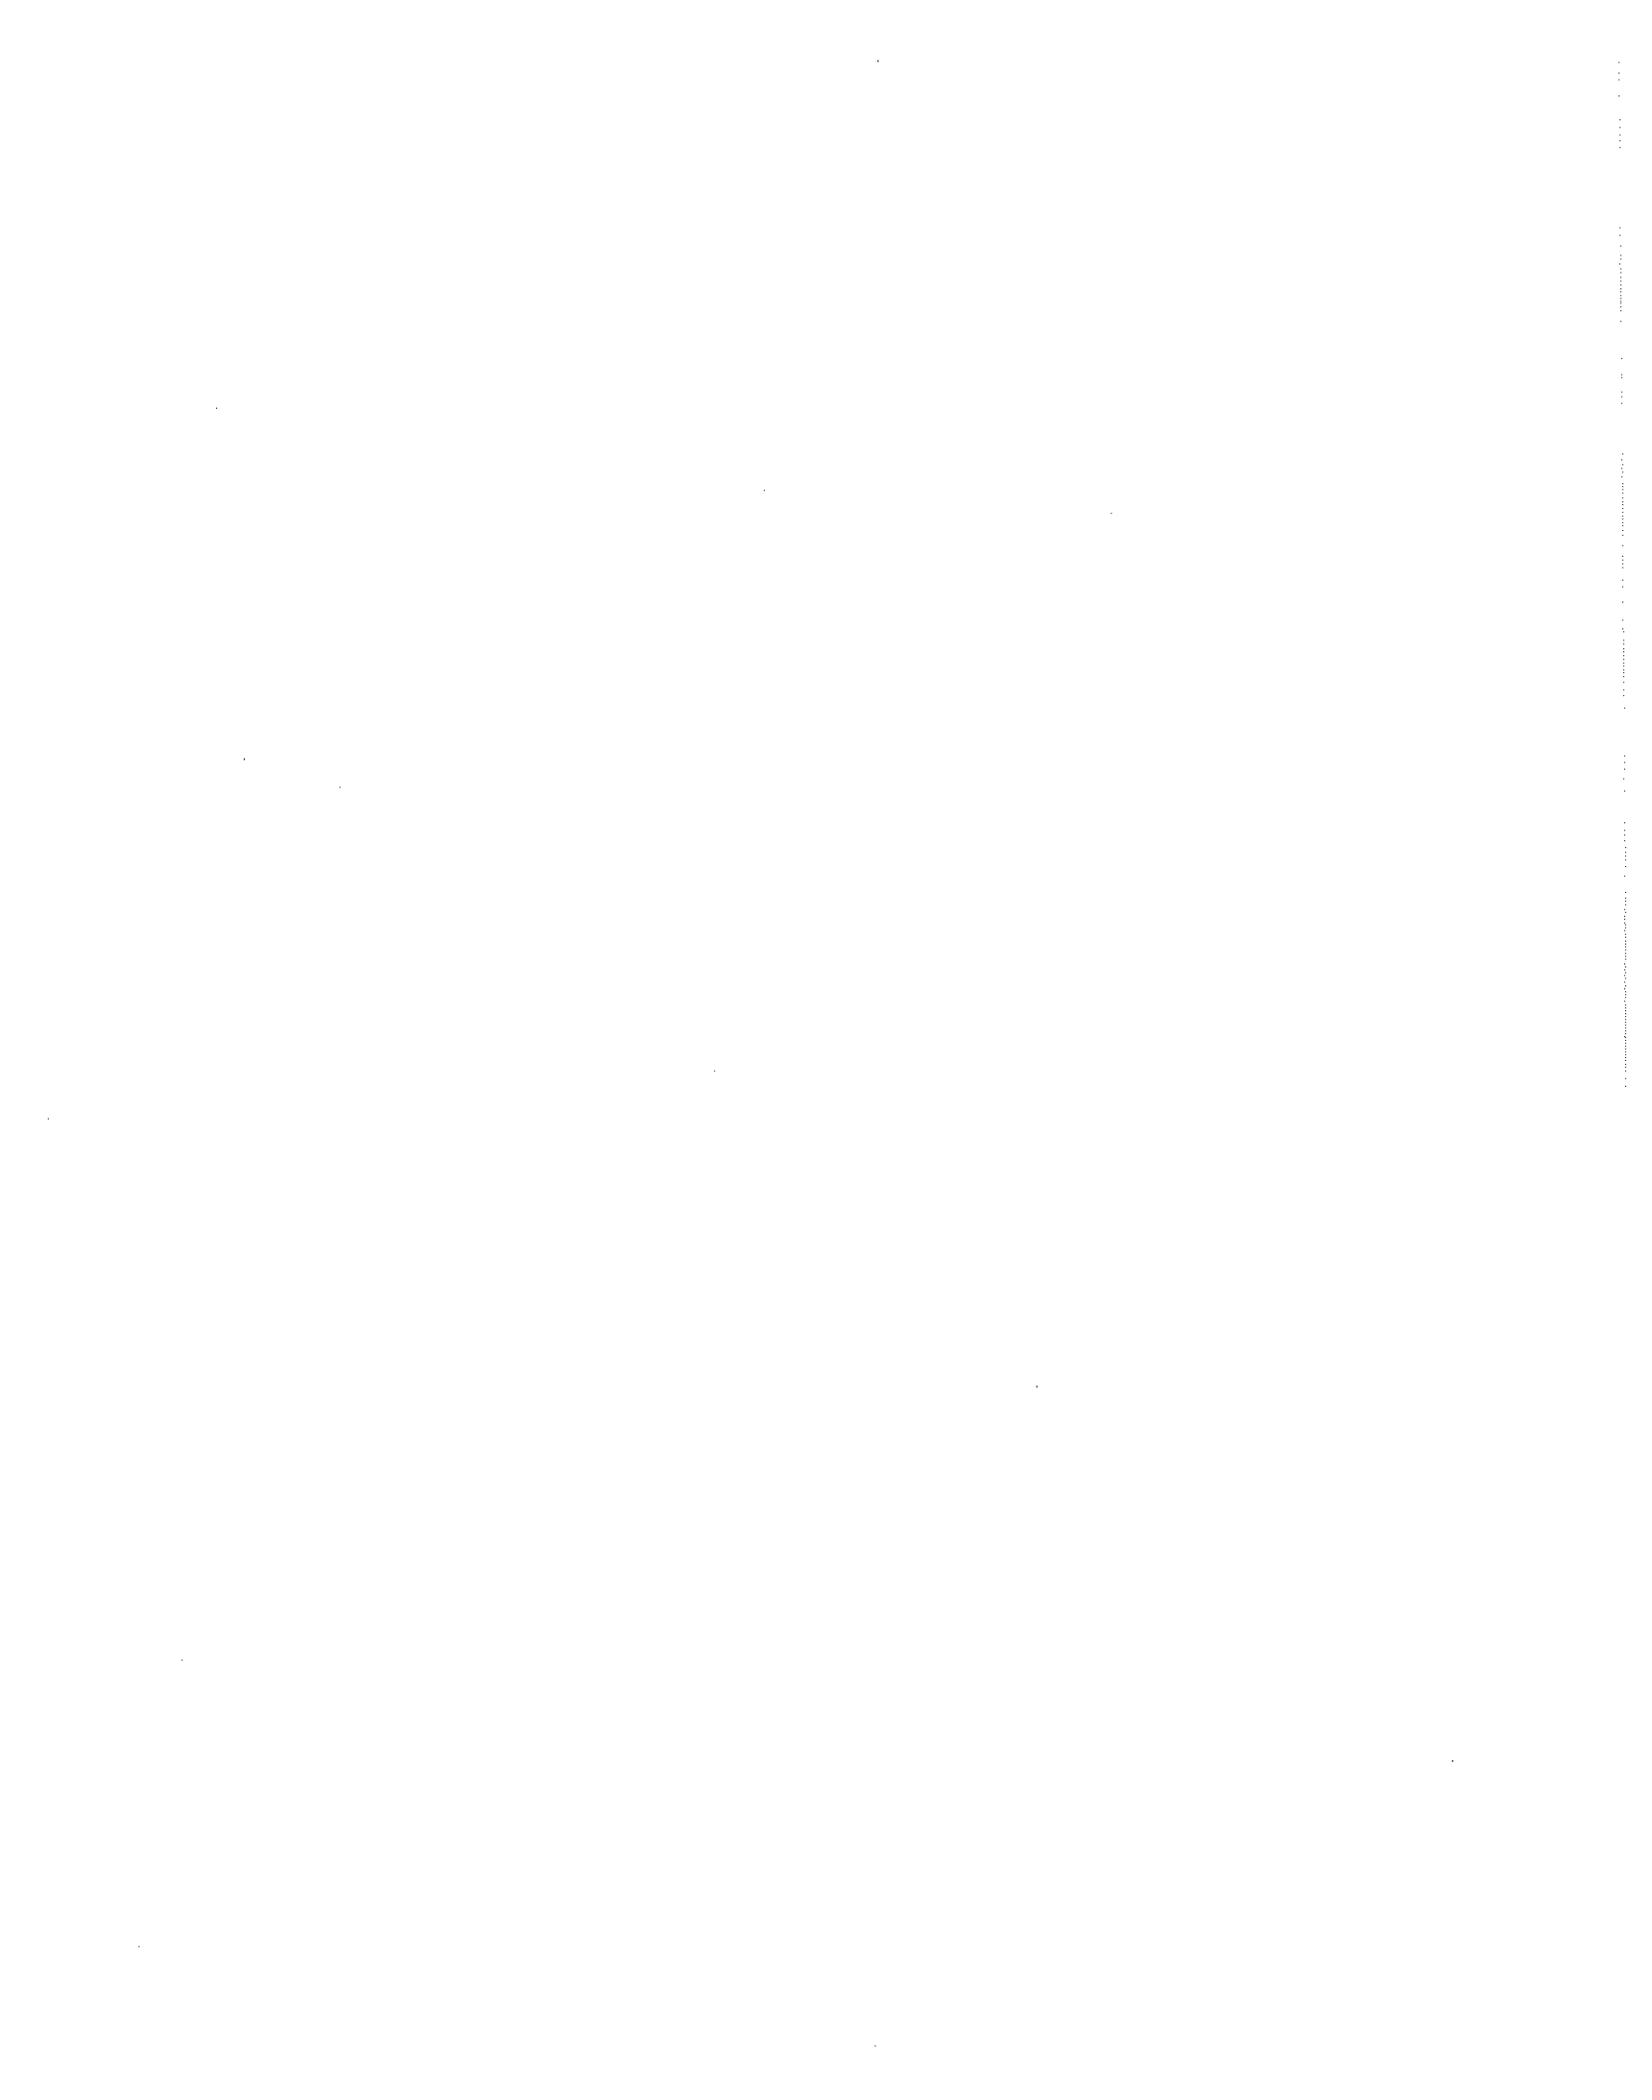

RÉSUMÉ

Morris, J. F. T., Trudel, M., Thiess, M. E., Zubkowski, T. B., Boyle, C. A., et MacLean, H. R. 2007. Campagne d'évaluation des saumons dans le Golfe de l'Alaska à bord du CCGS *W.E. Ricker* entre le 28 février et le 27 mars 2006. Can. Data Rep. Fish. Aquat. Sci. 1191: 73 p.

Le programme canadien des Saumons en Haute Mer de Pêches de Océans Canada a mené une étude sur les saumons du Pacifique dans le Golfe de l'Alaska entre le 28 février et le 27 mars 2006. Les objectifs de cette étude étaient de (1) évaluer la distribution et l'écologie des saumons du Pacifique (*Oncorhynchus* spp.) juvéniles durant leur première année en mer, (2) décrire les conditions océanographiques ambiantes, et (3) quantifier la biomasse de zooplancton. Nous avons mesuré les conditions océanographiques et échantillonné le zooplancton et les poissons à des stations situées entre le Banc Swiftsure sur la côte ouest de l'Île de Vancouver et le détroit de Frédérique dans le sud-est de l'Alaska (57.25 ° N).

En tout, 880 saumons du Pacifique ont été capturés durant cette étude, incluant: 367 saumons kétas (*O. keta*) juvéniles (âge 0.1) durant leur premier hiver en mer, 30 saumons roses (*O. gorbuscha*) juvéniles (âge 0.1), 4 saumons rouges (*O. nerka*) juvéniles (âge X.1), 52 saumons cohos (*O. kisutch*) juvéniles (âge X.1), et 376 saumons quinnats (*O. tshawytscha*) mesurant entre 100 et 350 mm (longueur à la fourche). Les saumons cohos juvéniles ont été principalement capturés sur le plateau continental et les fjords de la côte ouest de l'Île de Vancouver, ce qui est conforme aux résultats obtenus antérieurement durant l'hiver par ce programme de recherche. Les saumons quinnats qui mesuraient entre 100 et 200 mm (longueur à la fourche), et qui étaient vraisemblablement de type océanique (âge 0.1), ont été exclusivement capturés sur le plateau continental et dans les fjords de la côte ouest de l'Île de Vancouver. Les saumons quinnats qui mesuraient entre 200 et 350 mm (longueur à la fourche) ont été principalement capturés sur la côte ouest de l'Île de Vancouver et dans le Déroit de Sumner dans le sud-est de l'Alaska. Les taux de capture des saumons roses, kétas, et rouges étaient généralement faibles et dispersés, mais 359 saumons kétas ont été capturés à une station dans le sud-ouest du Déroit d'Hécate.

Sur ces 18 saumons quinnats juvéniles marqués à l'aide d'un CWT qui ont été capturés durant cette étude, 8 étaient de type océanique qui mesuraient entre 210 et 274 mm, et 7 étaient de type riverain originaire qui mesuraient entre 270 et 381 mm.

INTRODUCTION

The Highseas Program of Fisheries and Oceans Canada has conducted annual Pacific salmon surveys in the Gulf of Alaska since 1995⁽¹⁻²⁶⁾. The main objectives of these surveys are to collect information on (1) the distribution and ecology of Pacific salmon (*Oncorhynchus spp.*) during their ocean phase, (2) the ambient oceanographic conditions, and (3) the distribution and biomass of zooplankton.

This report documents the data collected for the survey completed from February 28 to March 27, 2006. The survey design comprised fish, oceanographic and zooplankton sampling from the west coast of Vancouver Island to Frederick Sound, Southeast Alaska.

MATERIALS AND METHODS

General Survey Information

Figures 1, 2, and 3 show the fishing, oceanographic and zooplankton stations, respectively, completed by the *CCGS W.E. Ricker* on the February 28 to March 27, 2006 survey. A total of 132 fishing stations, 129 oceanographic stations, and 129 zooplankton stations were completed.

The Highseas Salmon program conducted scientific operations on this survey on the shelf and within the inlets off the west coast of Vancouver Island, in Queen Charlotte Sound, along the inside passage and within the inlets on the central coast of British Columbia, in Hecate Strait, in Dixon Entrance, in Portland Inlet, within the straits of Southeast Alaska, and on the shelf off Southeast Alaska. Three of the Highseas Salmon program's standard cross-shelf transects were completed: the Estevan Point transect off the west coast of Vancouver Island, the Hecate Strait transect, and Forrester Island transect off Southeast Alaska.

Fishing Gear and Fishing Operations

The Highseas Salmon program conducted the survey on the *CCGS W.E. Ricker*, which is stern trawler 58 m in length that is powered by a 2,500 H.P. model AH 40 Akasaka diesel engine. The *CCGS W.E. Ricker* towed a mid-water trawl, originally manufactured by Cantrawl Nets Ltd., Richmond, BC, and later modified to a model 240 trawl. The trawl has a heavy-duty front end of hexagonal web made from 3/8 in. (9.5 mm) and 5/16 in. (7.9 mm) Tenex rope, and a tapered body made-up of 64 in. (163 cm), 32 in. (81.3 cm), 16 in. (40.6 cm), 8 in. (20.3 cm) and 4 in. (10.2 cm) polypropylene sections, an intermediate section of 3 in. (7.6 cm) polypropylene, and a codend of 1.5 in. (3.8 cm) knotted nylon lined with 0.25 in. mesh (64 mm). The trawl has three 40 m bridles of 5/8 in. (1.6 cm) wire rope per side that are attached with a single hook-up to 5 m Jet doors. Typically, 100-150 m of 1.25 in. (3.2 cm) warp was paid out to tow the trawl at the surface.

The *CCGS W.E. Ricker* was able to tow the trawl at the surface at 5 knots (2.6 m s^{-1}) in good sea conditions, and this typically achieved a mouth opening of approximately 28 m wide by 16 m deep as measured acoustically by a Scanmar trawl eye mounted on the headrope. In rough weather, the trawl was towed at headrope depths down to 15 m.

Oceanographic Sampling

At oceanographic stations, the scientific crew (1) conducted CTD (conductivity-temperature-depth) casts, (2) collected seawater samples at 10 m from the surface with a Niskin bottle for nitrate, phosphate, silicate, and salinity, and (3) filtered surface seawater on GF/F glass fibre filter disks for chlorophyll *a*.

Nitrate, phosphate, and silicate samples were collected in acid-washed glass test tubes, and the glass fiber disks were folded and placed in polypropylene scintillation vials. All these samples were stored frozen.

CTD casts were routinely conducted to 250 m or within 5 m of the bottom with a Seabird SBE 911+ probe, but they were conducted to 500 m depths at selected stations to obtain salinity samples for calibrations.

Zooplankton Sampling

Vertical bongo tows to approximately 150 m or within 10 m of the bottom were conducted with two 57 cm diameter, 253 μm Nitex nets. One of the nets was equipped with a flowmeter.

Zooplankton collected from the net with the flowmeter were preserved in 10% formalin and sent to the zooplankton laboratory at the Institute of Ocean Sciences, Fisheries and Oceans Canada (Sidney, BC) for species classification and enumeration. Zooplankton taken from the net without flowmeter were sorted into four size fractions by successively sieving through 8.0, 1.7, 1.0, and 0.25 mm screens.

RESULTS

Salmon Catch Data

Tables 1 and 2 report information on trawl tows and a summary of Pacific salmon catches for this survey. Tow information includes: station ID, transect name, sampling region, date and time, start latitude ($^{\circ}\text{N}$) and longitude ($^{\circ}\text{W}$), heading ($^{\circ}\text{T}$; degrees true), and bottom depth (m). Station ID numbers consisted of the Pacific Biological Station cruise designation ("HS200609", where HS stands for High Seas), followed by a tow number (e.g., "HS200609-IV101" for a tow #1 inside the inlets on the west coast of Vancouver Island, British Columbia). The station ID number serves as the primary key in the High Seas salmon database that links fishing tow information with the oceanographic and zooplankton tables.

Table 1 provides catch totals for each tow all chinook salmon (*O. tshawytscha*) ("CK") that includes all ages and size classes, and separately for juveniles and adults of chum salmon (*O. keta*) ("CM"), coho salmon (*O. kisutch*) ("CO"), pink salmon (*O. gorbuscha*) ("PK"), and sockeye salmon (*O. nerka*) ("SE"). In this report, juveniles are defined as salmon in their first winter in the ocean (age X.1). Adults include all older age groups (age X.2+ or older). Age separation was determined based on examination of size distributions (fork length) which showed non-overlapping size modes for chum, coho, pink, and sockeye salmon. Chinook salmon were not divided into juveniles and adults based on size since there is considerable overlap among size modes that represent the multiple age groups.

Table 2 provides catch totals for each tow for size classes of chinook salmon that include chinook less than 100 mm, chinook from 100 to 199 mm, chinook from 200 to 299 mm, chinook from 300 to 349 mm, chinook from 350 to 399 mm, chinook from 400 to 499 mm, and chinook 500 mm and more in forklength.

The abbreviations for the regions in the tables are:

ISEA	inside straits of Southeast Alaska
SEA	Southeast Alaska
DE	Dixon Entrance
HS	Hecate Strait
IBC	inside channels on the central coast of British Columbia
QCSD	Queen Charlotte Sound
VI	west coast of Vancouver Island
IVI	inlets on the west coast of Vancouver Island

Biological Data

Table 3 reports the detailed biological data collected from each Pacific salmon caught during the survey. Individual salmon were assigned a fish number which consisted of the cruise identifier (e.g., "HS200609"), followed hierarchically by tow number, species code, and sample number. For example, "HS200609-DE01-124-001" refers to tow number DE01 or tow #1 in Dixon Entrance, species code "124" for chinook salmon, and the sample number "001" (within tow and species). We used the following codes from Fisheries and Oceans' Salmon Stock Assessment database: 108, pink salmon; 112, chum salmon; 115, coho salmon; 118, sockeye salmon; and 124, chinook salmon.

Biological data that was collected for individual salmon includes species common name, fork length (mm), whole body weight (g wet), sex, stomach content weight (g wet), coded wire tag number, pit tag number, and observed fin clip.

Juvenile Salmon Catch Distributions

Juvenile pink (age 0.1) were caught in the range of 1-25 fish per tow at three scattered stations in Hecate Strait and Dixon Entrance (Figure 4).

Juvenile chum (age 0.1) were caught at a few scattered stations in British Columbia within the range of 1 to 5 fish per tow on the survey, except for station HSS01 in south-western Hecate Strait where 359 were caught (Figure 5).

Just 4 juvenile sockeye (age X.1) in total were caught at three scattered stations on the west coast of Vancouver Island and in Hecate Strait (Figure 6).

Juvenile coho (age X.1) were caught mostly on the shelf and within the inlets on the west coast of Vancouver Island at an average of 0.72 fish per tow (Figure 7). Just 7 were caught on two tows off Langara Island in Dixon Entrance. In addition, one was caught inside Southeast Alaska and another in Portland Inlet.

Juvenile chinook in the size class 100-199 mm, that were mostly age 0.1 ocean ecotypes based on CWT recoveries from this survey (Table 6.) and previous Canadian Highseas Salmon surveys (^{1,5,14,16, and 17}), were all caught both on the shelf and within the inlets on the west coast of Vancouver Island at an average of 0.29 fish per tow (Figure 9).

Juvenile chinook in the size class 200-299 mm were caught mostly on the shelf and within the inlets on the west coast of Vancouver Island at an average of 4.86 fish per tow, and in Sumner Strait in Southeast Alaska at an average of 3.31 fish per tow (Figure 10). Based on CWT recoveries on this survey (Table 6) and previous surveys (^{1,5,14,16, and 17}), these juvenile chinook were a mixture of ocean (age 0.1) and stream (age 1.1) ecotypes off the west coast of Vancouver Island, and were all stream (age 1.1) ecotypes in Sumner Strait. In addition, two juvenile chinook from 200 to 299 mm in forklength were caught in McIntyre Bay in Dixon Entrance and one was caught in Seaforth Channel on the central coast of British Columbia.

Juvenile chinook in the size class 300-349 mm were caught mostly on the shelf and within the inlets on the west coast of Vancouver Island at an average of 0.10 fish per tow and inside Southeast Alaska at an average of 0.66 fish per tow (Figure 11). In addition, three juvenile chinook from 300 to 349 mm in forklength were caught at one station in McIntyre Bay in Dixon Entrance, two were caught in Portland Inlet, and one was caught on the transect across Hecate Strait.

Both the juvenile coho and chinook distributions were consistent with previous winter surveys (^{1,5,14,16, and 17}).

Size Comparisons of Juvenile Salmon Among Regions

Figure 16 shows the length frequencies for pink, coho, chum, and chinook salmon caught on the cruise.

Figure 17 suggests that juvenile pink were greater in size in Dixon Entrance, where they averaged 323 mm in forklength, than in Hecate Strait where they averaged 288 mm. Sample sizes were too small (N=7 and N=23, respectively) for a definitive comparison.

Juvenile chum averaged 262 mm in fork length on the survey and figure 18 suggests that there was no difference in size between Dixon Entrance and Hecate Strait. The sample size was too small in Dixon Entrance (N=8) for a definitive comparison.

Figure 19 suggests that juvenile coho were greater in size in Dixon Entrance, where they averaged 411 mm in forklength, than on shelf and within the inlets on the west coast of Vancouver island, where they averaged 333 and 339 mm, respectively. Sample sizes were too small in Dixon Entrance (N=8) for a definitive comparison.

No regional comparisons of size were made for both juvenile chinook of specific ocean age classes due to the considerable overlap among size modes that represent multiple age groups, and juvenile sockeye due to small sample sizes.

CWT Recoveries

Table 6 reports the details on the coded wire tag (CWT) salmon caught during the survey. Reported information includes the coded wire tag number, the assigned fish number, species common name, the date and region of recovery, the fork length (mm) at capture, the release area, the name of the agency and hatchery that released the tagged fish, the brood year, and dates of first and second hatchery releases.

The abbreviations for release agencies in Table 6 are:

ADFG	Alaska Department of Fish and Game
CDFO	Canadian Department of Fisheries and Oceans
HVT	Hoopla Valley Tribe (CA)
NISQ	Nisqually Tribe (WA)
ODFG	Oregon Department of Fish and Wildlife
SSRA	Southern Southeast Regional Aquaculture Assn. (AK)
SUQ	Suquamish Tribe (WA)
WDFW	Washington Department of Fish and Wildlife

The abbreviations for release areas in Table 6 are:

GST	Georgia Strait, BC
KLAM	Klamath R - Trinity R, California
LOCR	Lower Columbia River
MPS	Puget Sound mid, Washington
NASK	Nass-Skeena, BC
NOOK	Nooksack R - Samish R, Washington
SEAK	Southeast Alaska
SKAG	Skagit R, Washington
SOOR	southern Oregon coast
SPS	Puget Sound south, Washington
UPCR	Upper Columbia River
WCVI	west coast Vancouver Island, BC

Eighteen chinook with CWT's were recovered on the survey. Of these, 8 were age 0.1, ocean ecotypes in their first winter at sea, that had been released in California, Oregon, Washington, and on the west coast of Vancouver Island in the spring of 2005, and captured on the the west coast of Vancouver Island. These ocean type chinook ranged in fork length from 210 to 274 mm. Seven were age 1.1, stream ecotypes that also had been released in the spring of 2005. Of these, 3 had been both released and captured in Southeast Alaska, 1 had been released in the Nass-Skeena region and captured in Dixon Entrance, and 3 had been released in Washington and captured on the west coast of Vancouver Island. These stream type chinook ranged in fork length from 270 to 381 mm.

Oceanographic Data

Table 4 reports the physical oceanographic data collected during the survey, that includes the station ID number, transect, region, the date and time in UTC, the latitude ($^{\circ}$ N) and longitude ($^{\circ}$ W), sea surface temperature (SST; $^{\circ}$ C), and salinity (SSS; ppt) taken from the CTD files, sea surface salinities (ppt) determined from the sample bottles that were used to calibrate the CTD probe, nitrate, silicate and phosphate concentrations ($\mu\text{mol L}^{-1}$), and chlorophyll *a* ($\mu\text{g L}^{-1}$).

The contact procedure to obtain the CTD files is available at:

http://www-sci.pac.dfo-mpo.gc.ca/osap/data/default_e.htm

Zooplankton Data

Table 5 reports the zooplankton data by station collected by the Bongo tows, including the station ID number, transect, region, latitude ($^{\circ}$ N) and longitude ($^{\circ}$ W), bottom depth (m), the date and time, target depth (m), tow duration, wire angle (degrees), and volume of ocean water sampled in cubic meters that is calculated from the flow meter readings.

The contact procedure to obtain detail species records from selected plankton sampling stations is available at:

http://www.pac.dfo-mpo.gc.ca/sci/osap/projects/plankton/zooplanktondatabase_e.htm

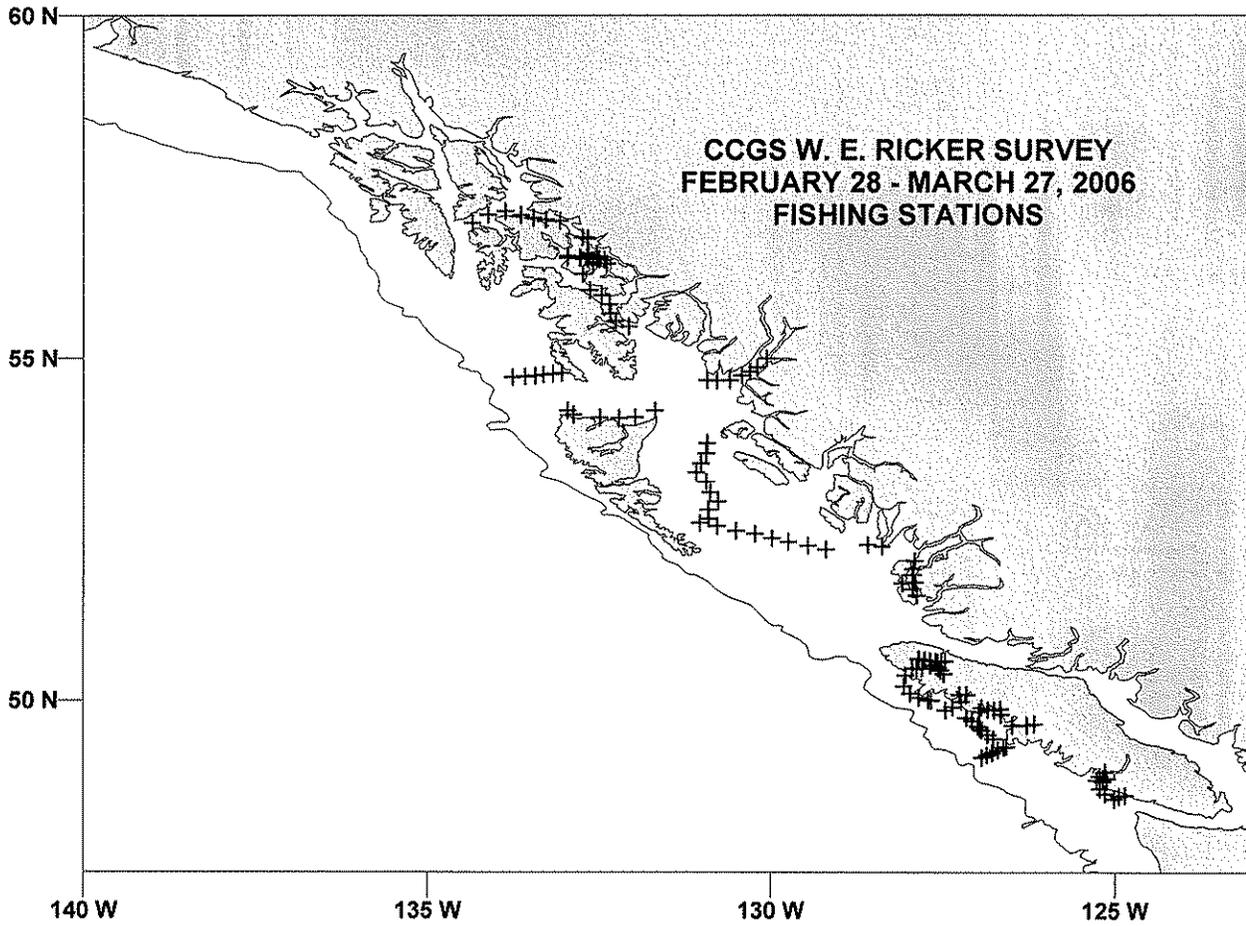

Figure 1. Fishing stations on the CCGS W. E. Ricker survey to the Gulf of Alaska, 28/02/2006 – 27/03/2006.

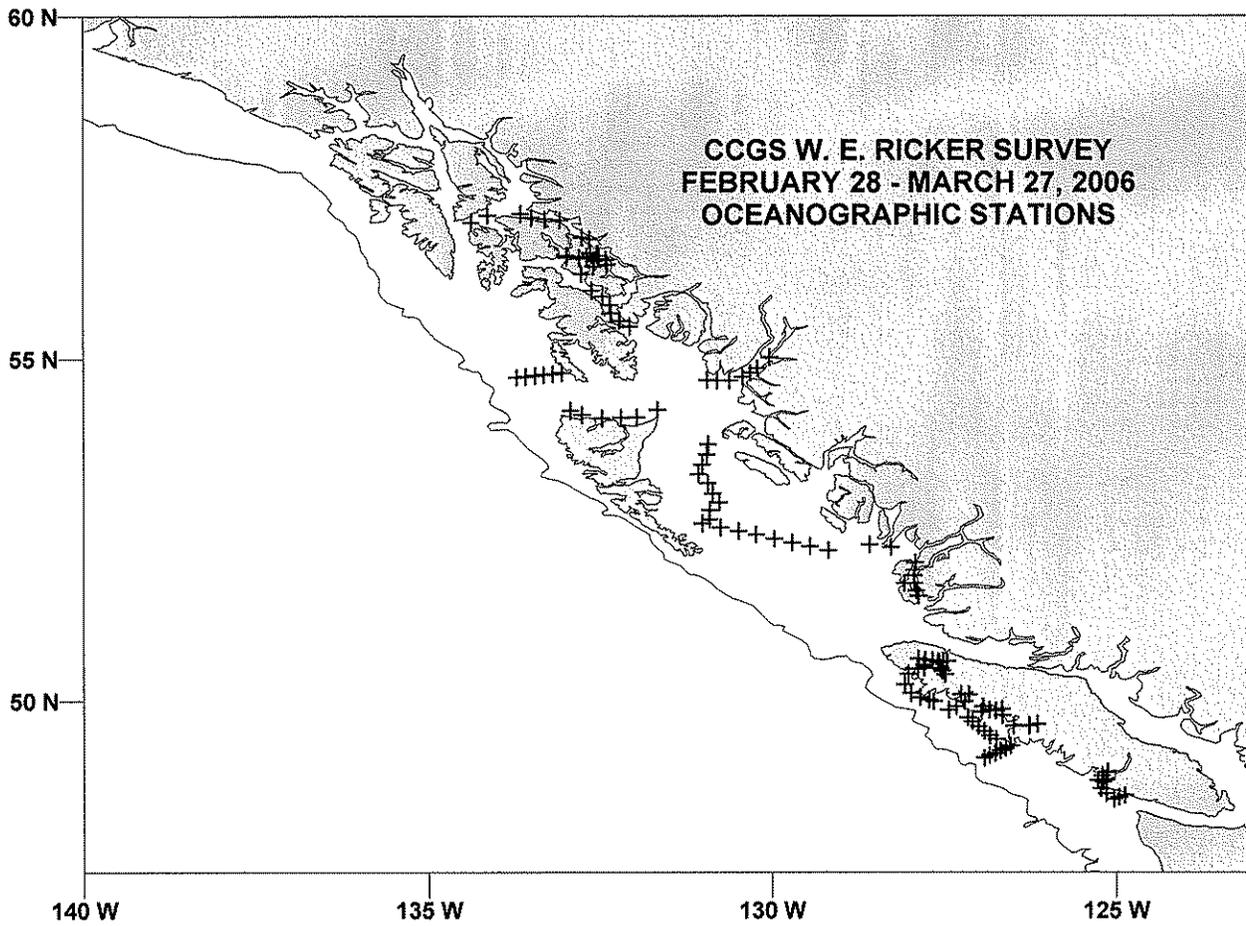

Figure 2. Oceanographic stations on the CCGS W. E. Ricker survey to the Gulf of Alaska, 28/02/2006 – 27/03/2006.

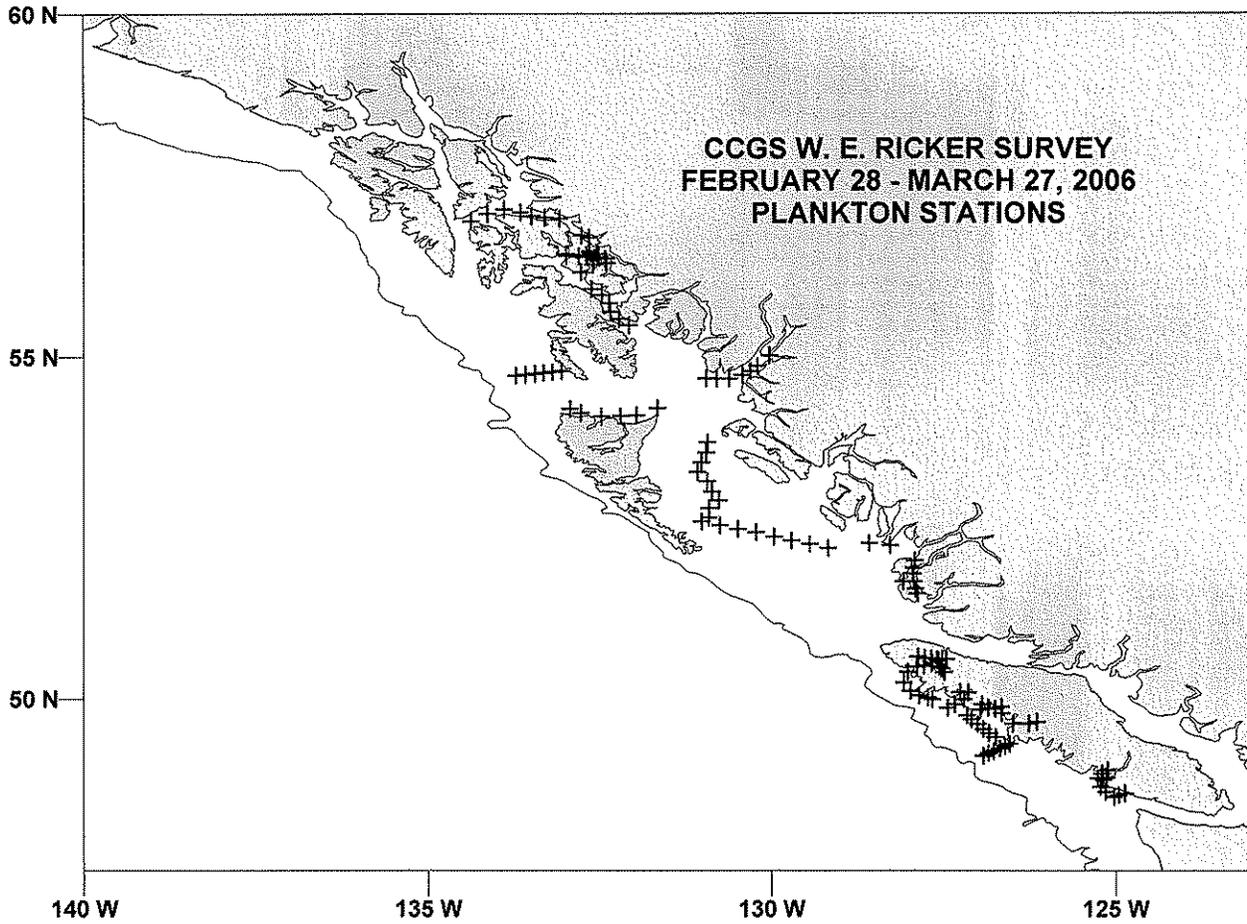

Figure 3. Plankton stations on the CCGS W. E. Ricker survey to the Gulf of Alaska, 28/02/2006 – 27/03/2006.

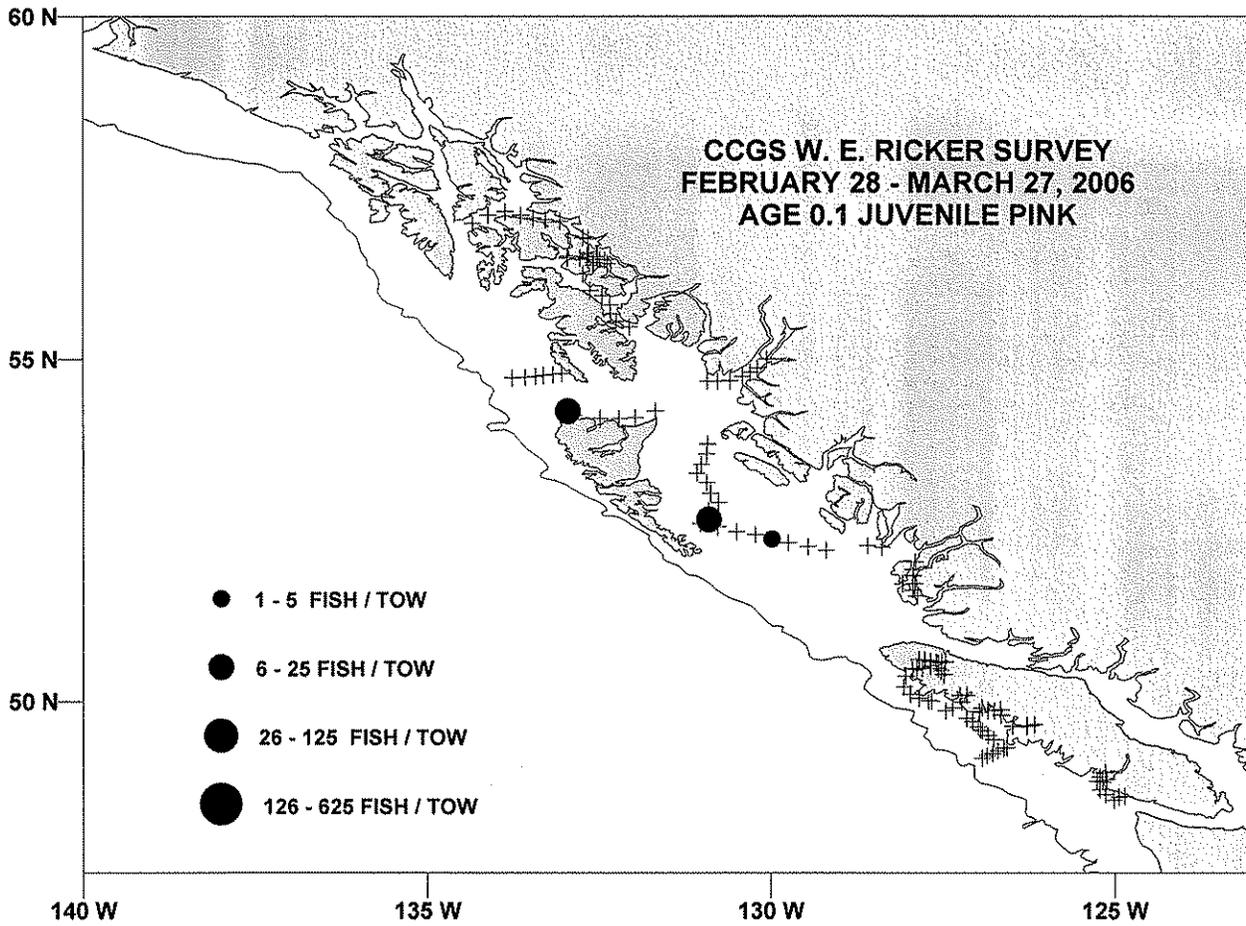

Figure 4. Distribution of age 0.1 juvenile pink salmon catches. Symbol size (●) is proportional to catch per tow; zero catches are shown by a (+).

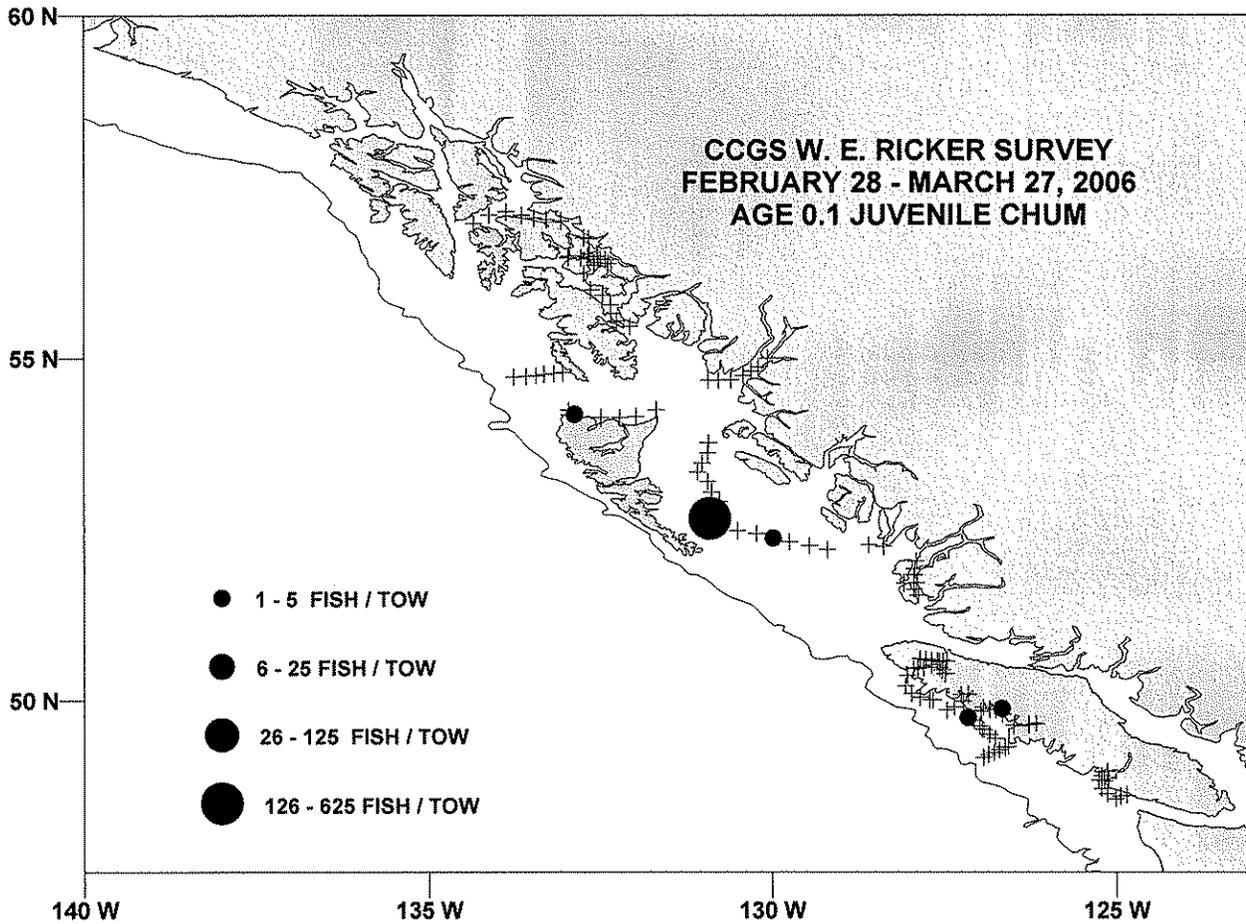

Figure 5. Distribution of age 0.1 juvenile chum salmon catches. Symbol size (●) is proportional to catch per tow; zero catches are shown by a (+).

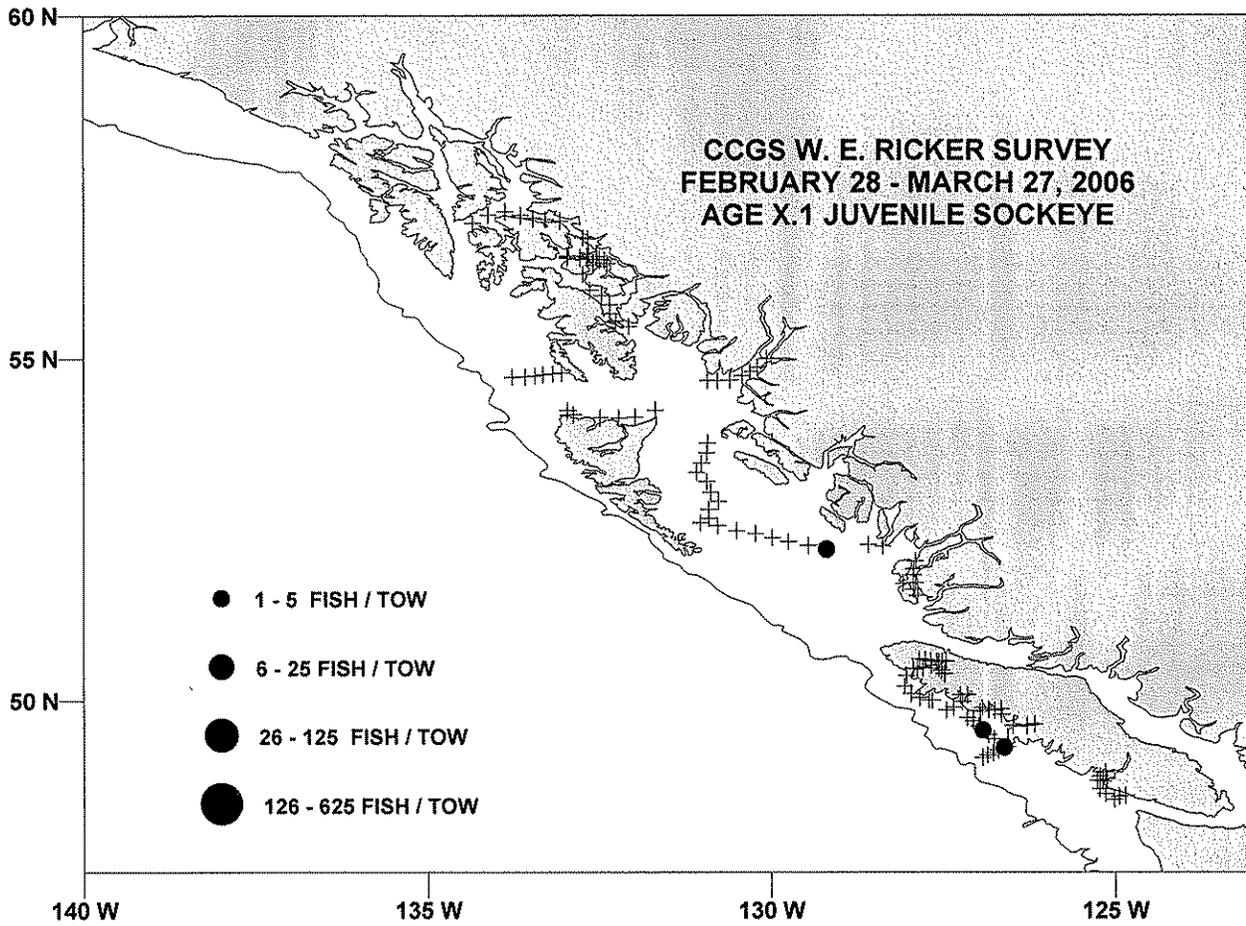

Figure 6. Distribution of age X.1 juvenile sockeye salmon catches. Symbol size (●) is proportional to catch per tow; zero catches are shown by a (+).

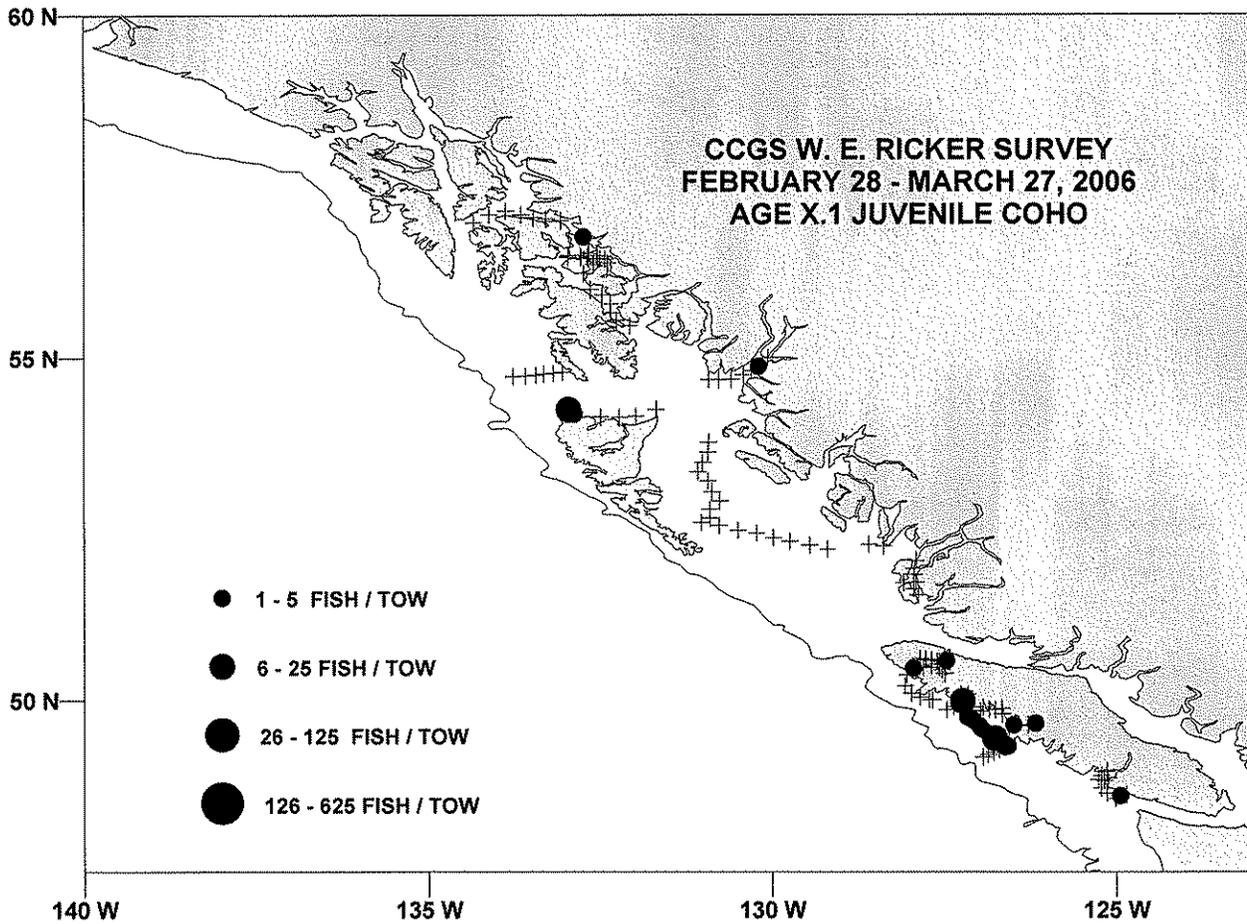

Figure 7. Distribution of age X.1 juvenile coho salmon catches. Symbol size (●) is proportional to catch per tow; zero catches are shown by a (+).

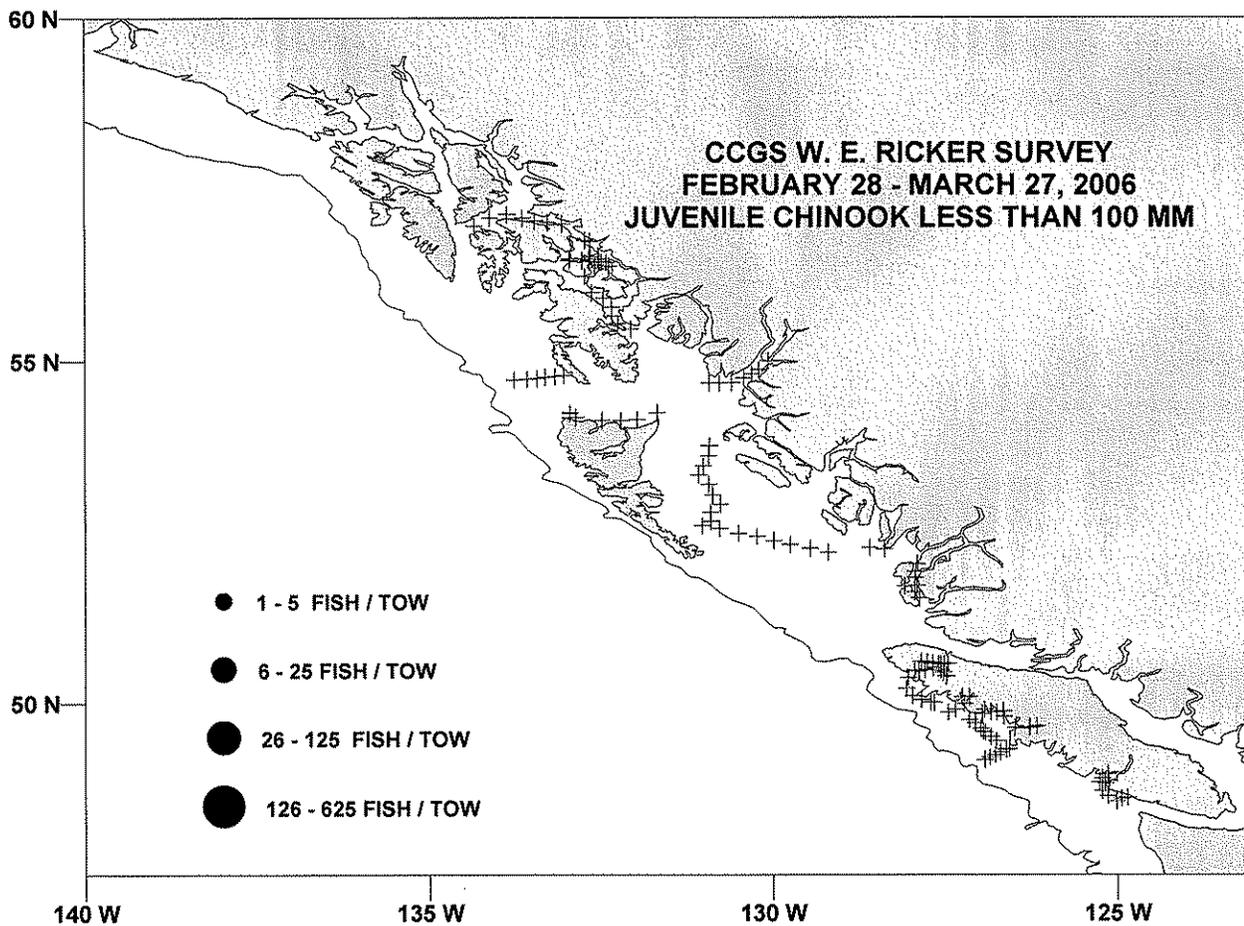

Figure 8. Distribution of catches of juvenile chinook less than 100 mm in fork length. Symbol size (●) is proportional to catch per tow; zero catches are shown by a (+).

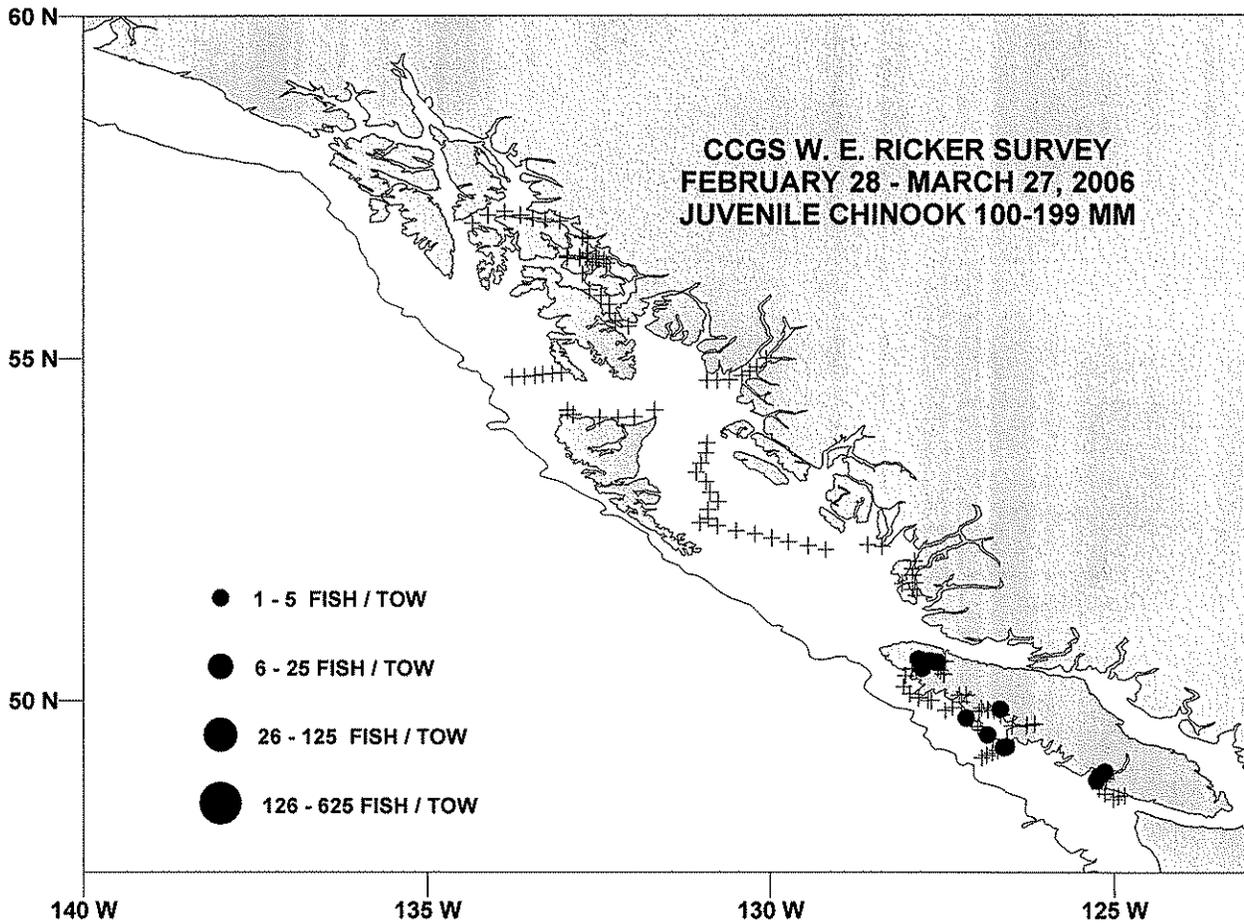

Figure 9. Distribution of catches of juvenile chinook salmon from 100 to 199 mm. Symbol size (●) is proportional to catch per tow; zero catches are shown by a (+).

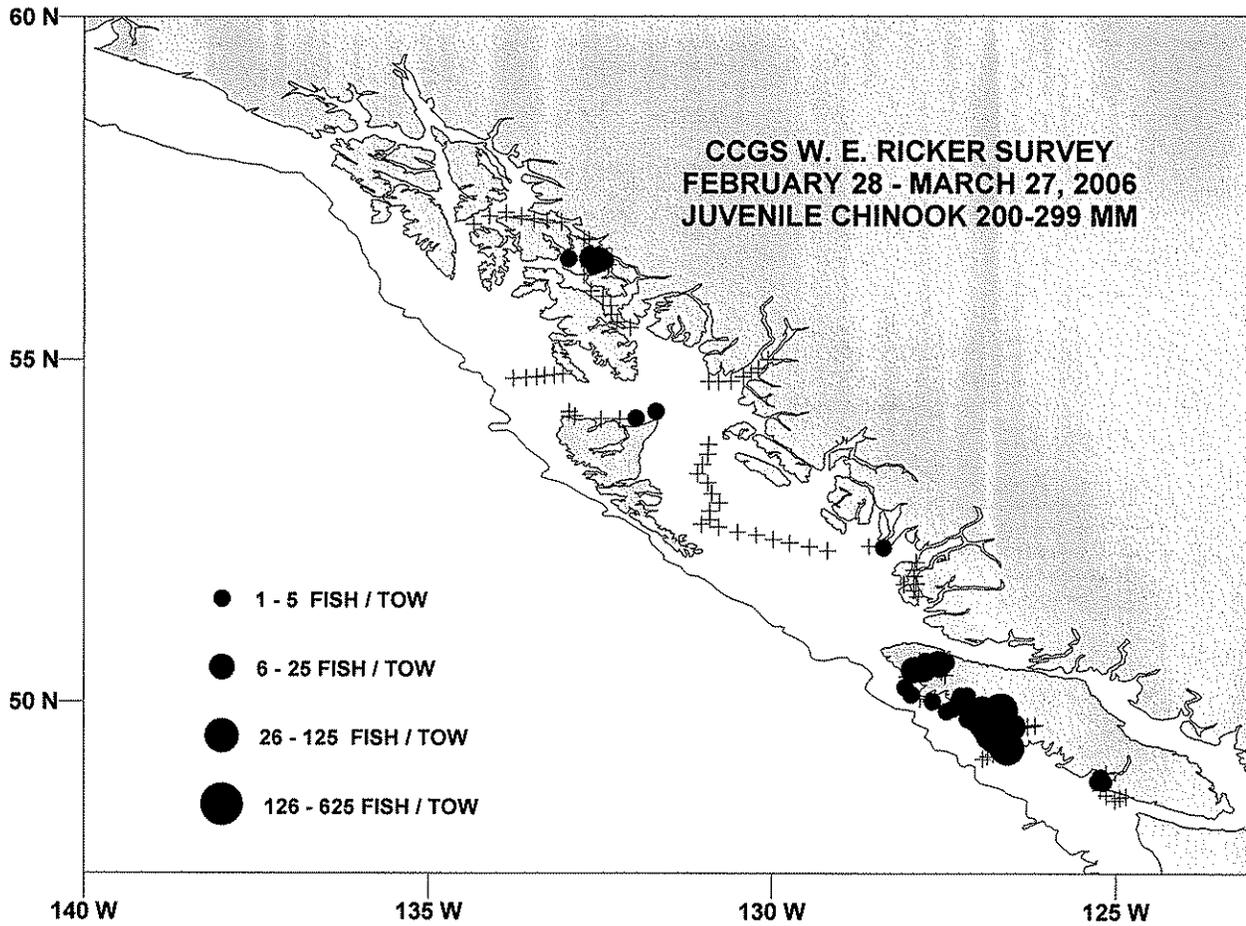

Figure 10. Distribution of catches of juvenile chinook salmon from 200 to 299 mm. Symbol size (●) is proportional to catch per tow; zero catches are shown by a (+).

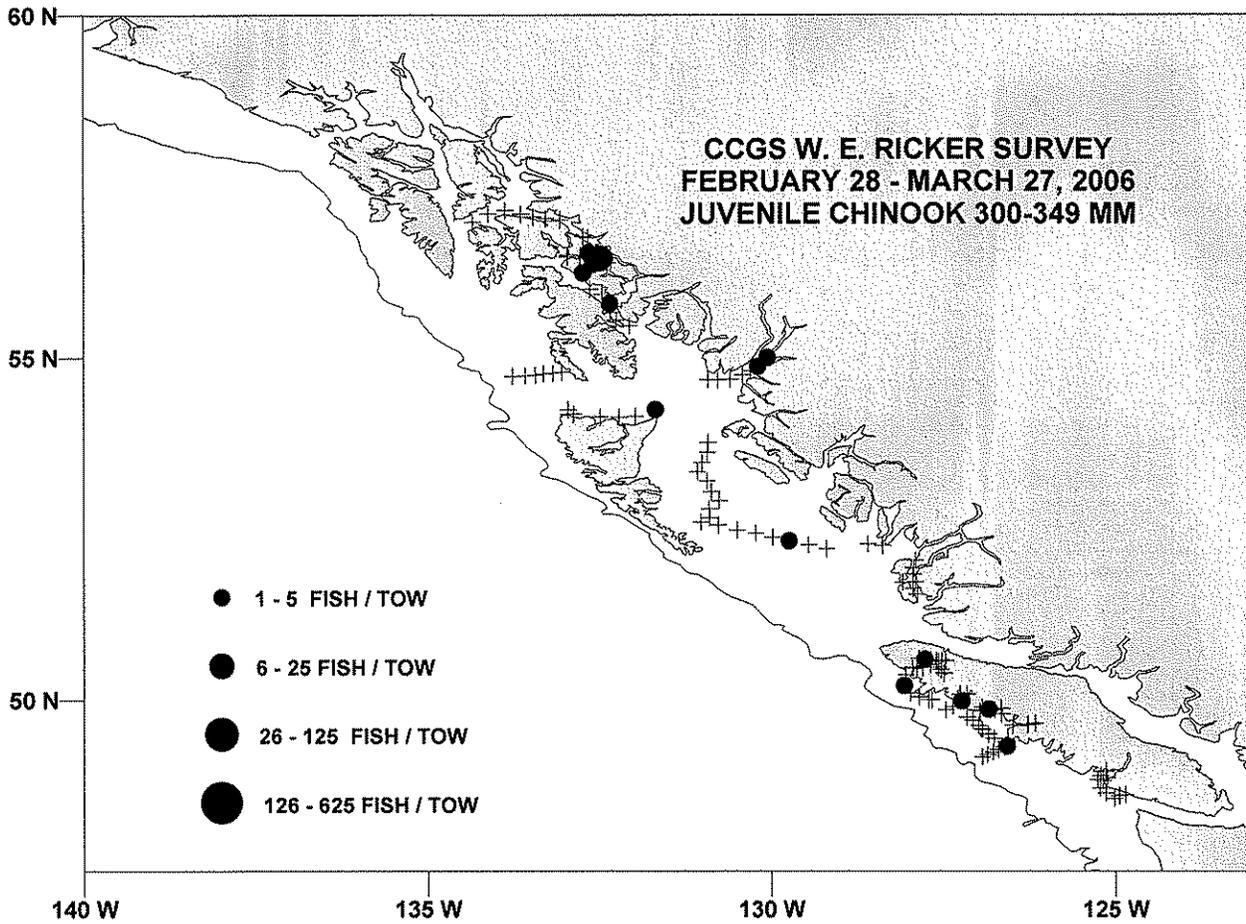

Figure 11. Distribution of catches of juvenile chinook salmon from 300 to 349 mm. Symbol size (●) is proportional to catch per tow; zero catches are shown by a (+).

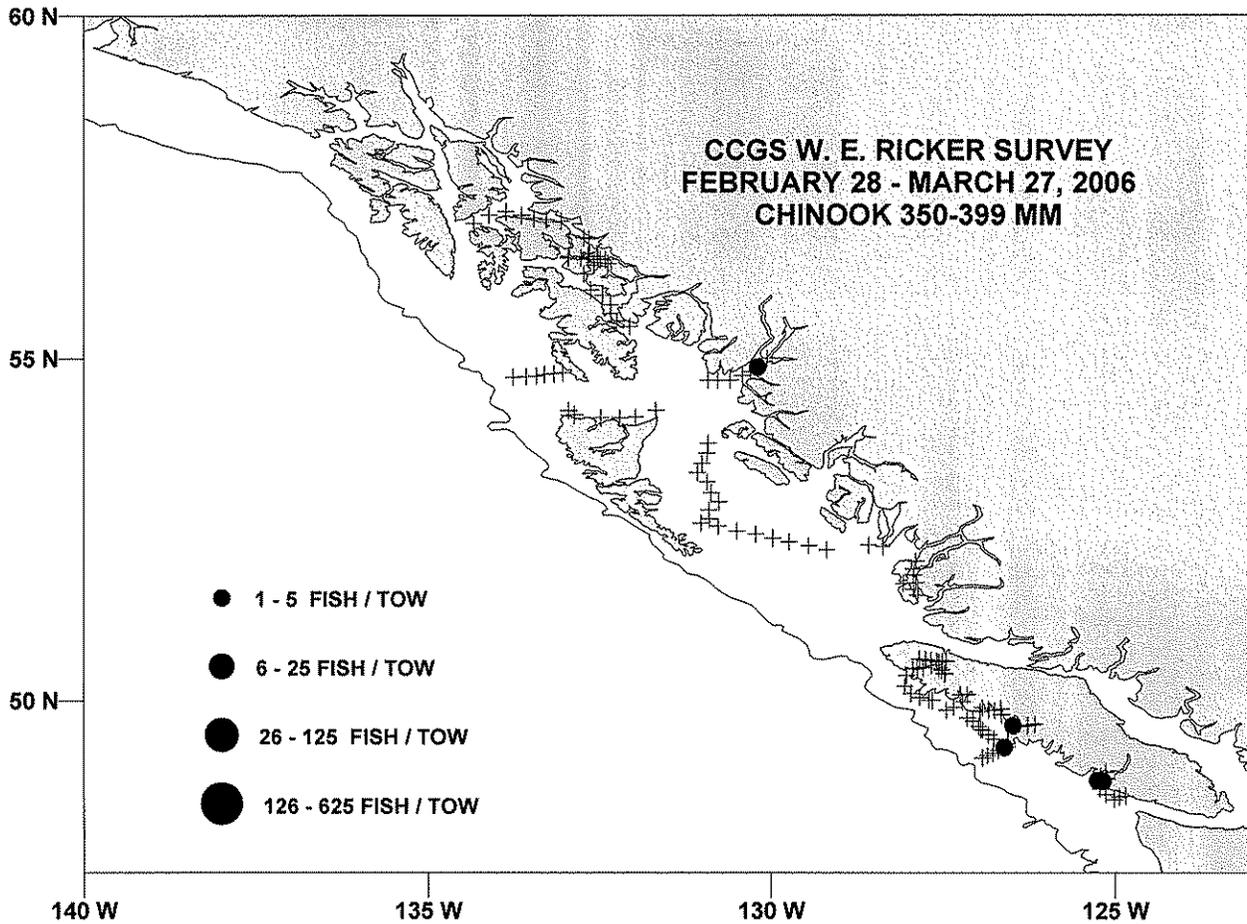

Figure 12. Distribution of catches of chinook salmon from 350 to 399 mm. Symbol size (●) is proportional to catch per tow; zero catches are shown by a (+).

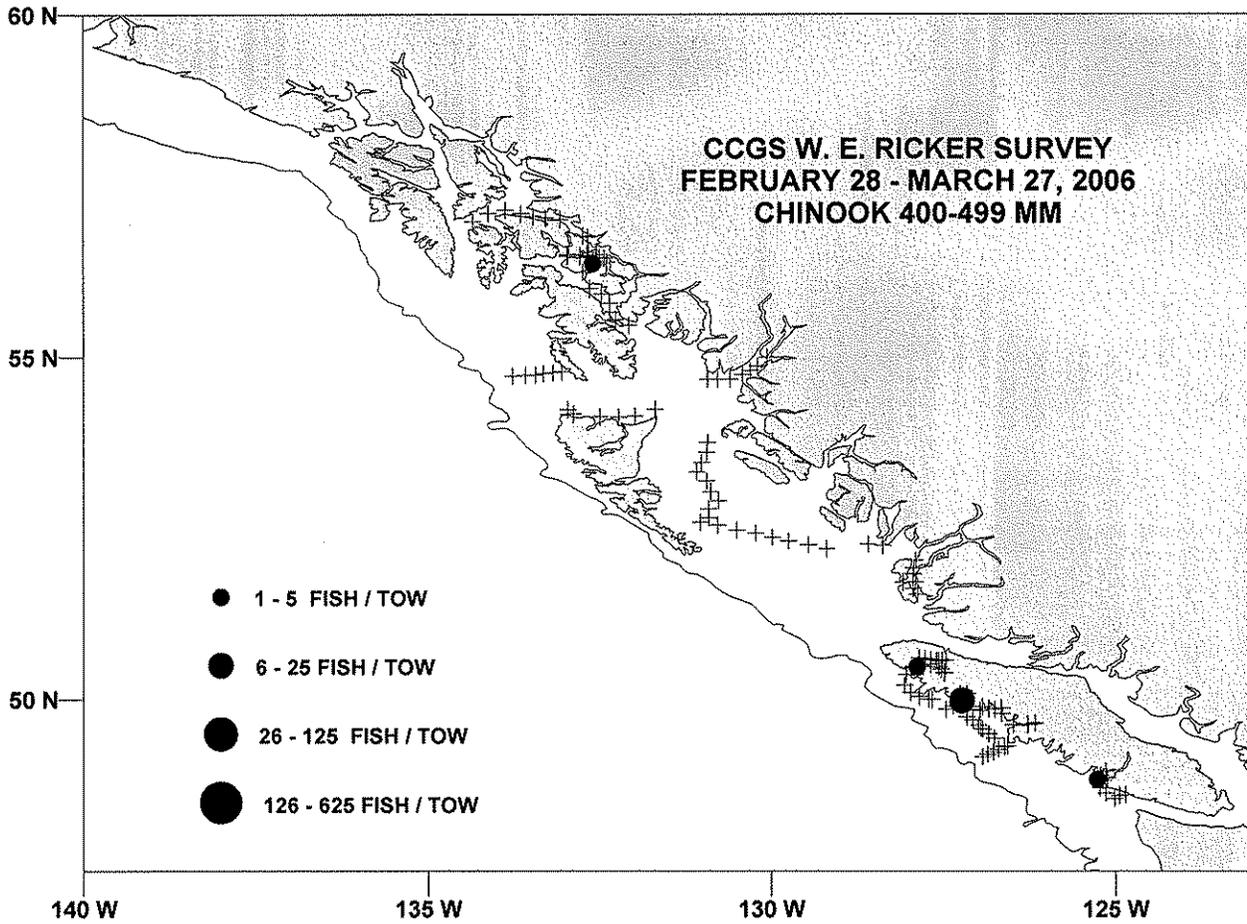

Figure 13. Distribution of catches of chinook salmon from 400 to 499 mm. Symbol size (●) is proportional to catch per tow; zero catches are shown by a (+).

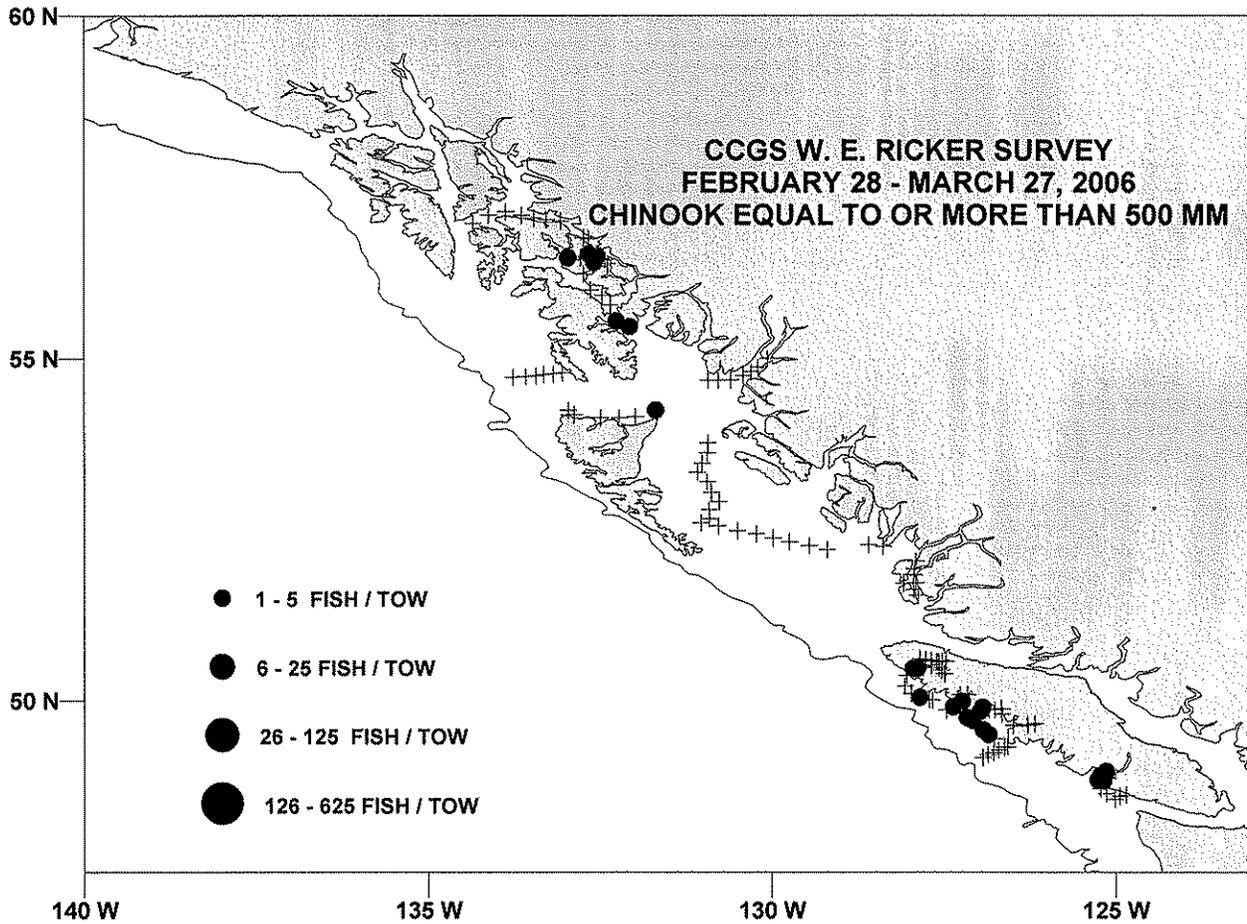

Figure 14. Distribution of of chinook salmon greater than or equal to 500 mm. Symbol size (●) is proportional to catch per tow; zero catches are shown by a (+).

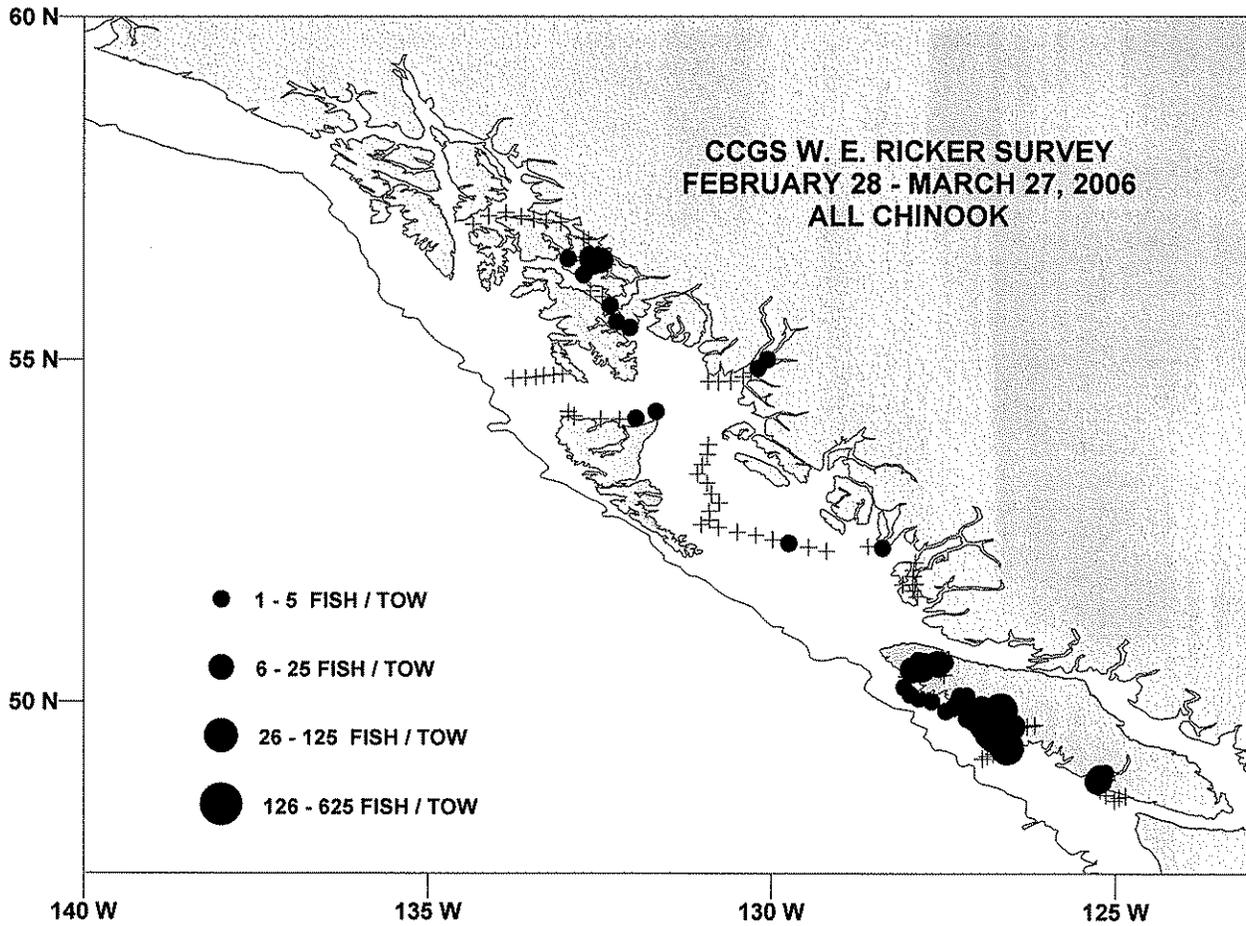

Figure 15. Distribution of catches of chinook from all size classes. Symbol size (●) is proportional to catch per tow; zero catches are shown by a (+).

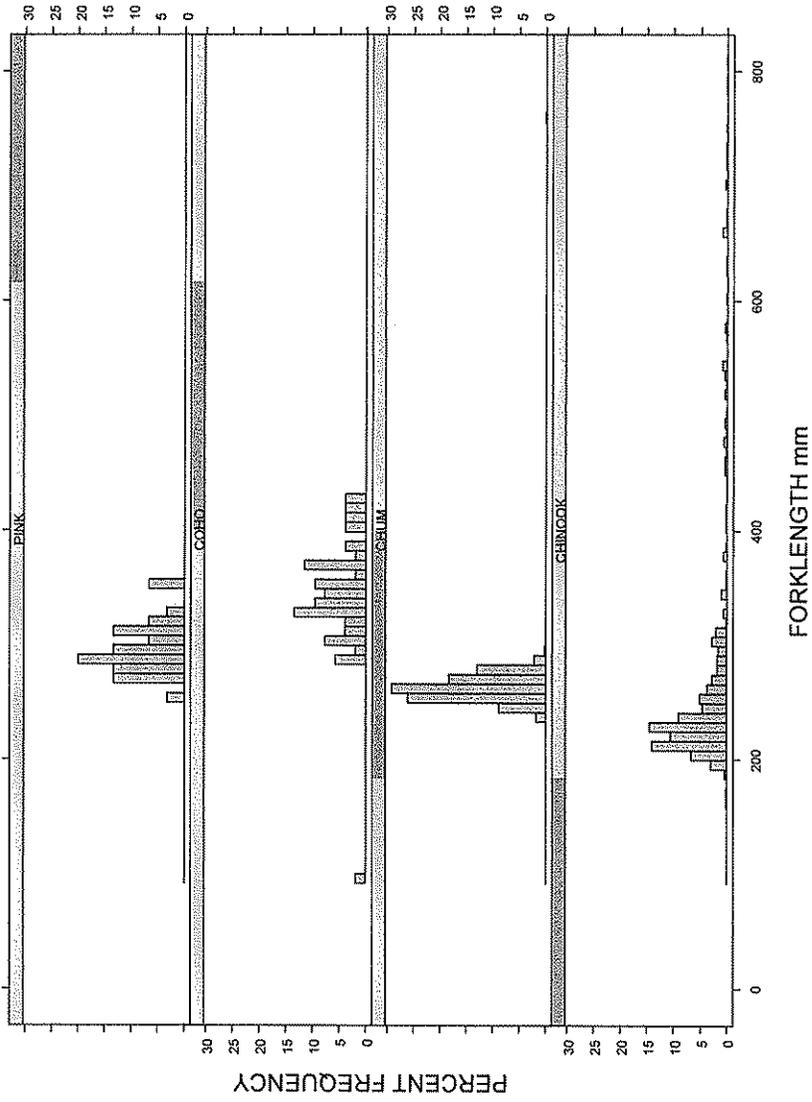

Figure 16. Size distribution (fork length; mm) of Pacific salmon caught on the CCGS W. E. Ricker survey to the Gulf of Alaska, 28/02/2006 – 27/03/2006.

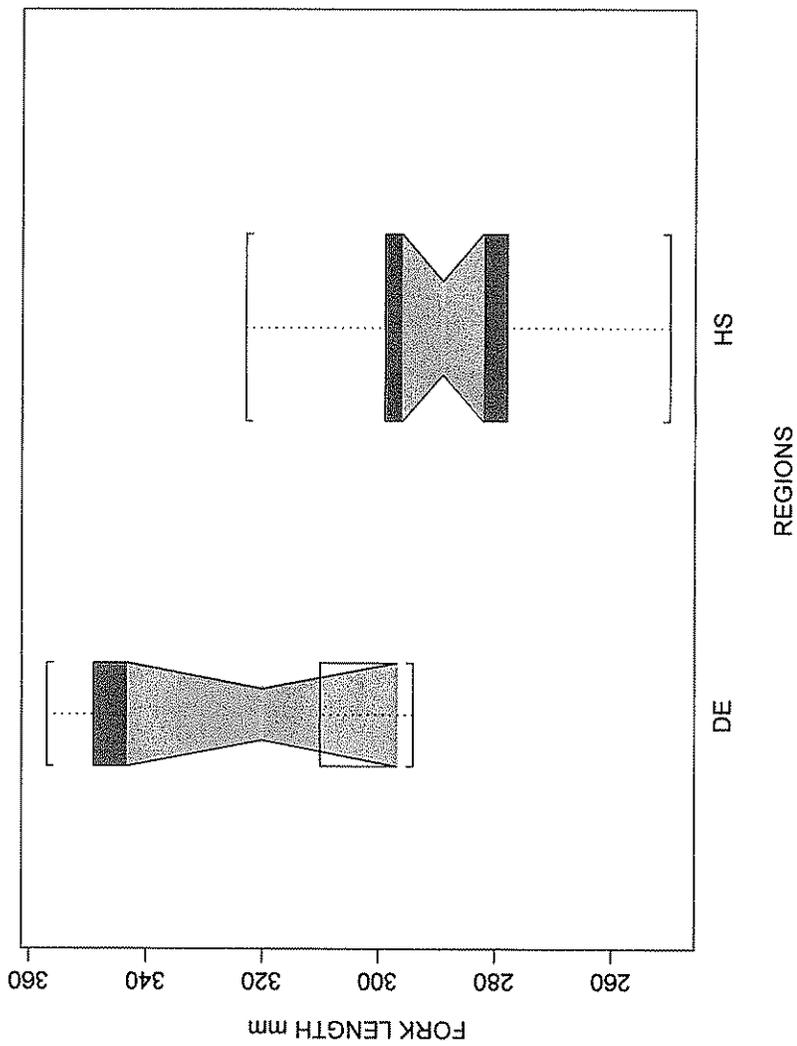

Figure 17. Boxplots of size distributions by region for juvenile pink salmon on the CCGS W. E. Ricker survey to the Gulf of Alaska, 28/02/2006 – 27/03/2006. Boxplots for each region are displayed along a latitudinal gradient that runs along the x-axis with the most northern region on the left.

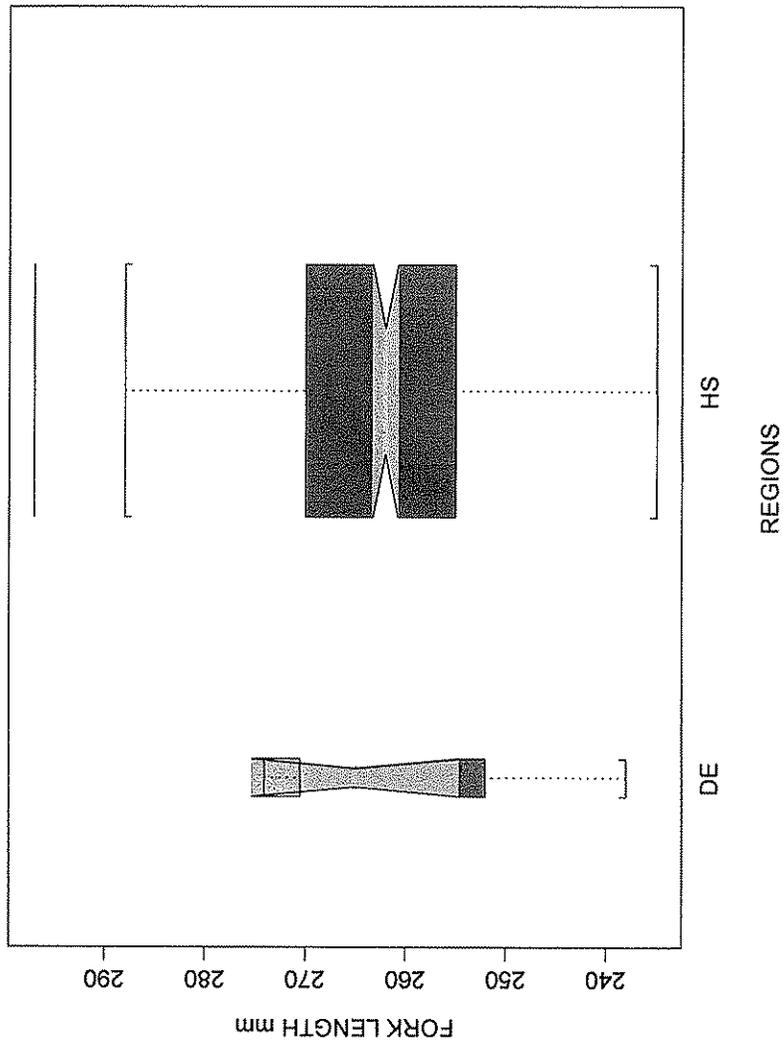

Figure 18. Boxplots of size distributions by region for juvenile chum salmon on the CCGS W. E. Ricker survey to the Gulf of Alaska, 28/02/2006 – 27/03/2006. Boxplots for each region are displayed along a latitudinal gradient that runs along the x-axis with the most northern region on the left.

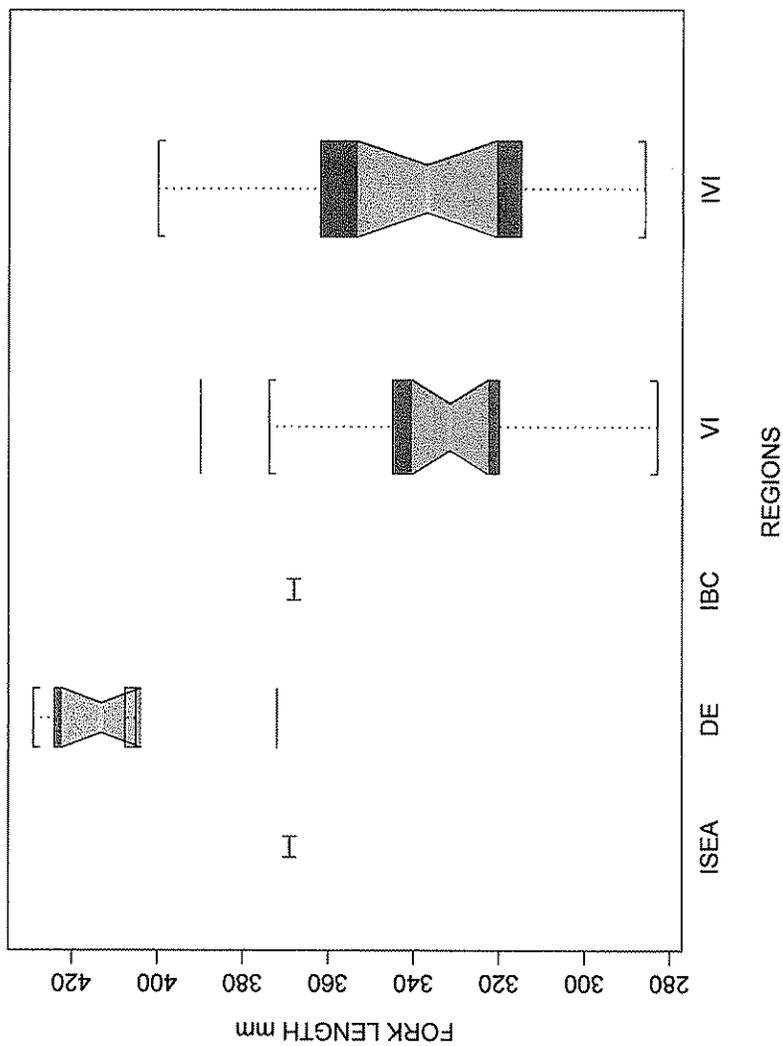

Figure 19. Boxplots of size distributions by region for juvenile coho salmon on the CCGS W. E. Ricker survey to the Gulf of Alaska, 28/02/2006 – 27/03/2006. Boxplots for each region are displayed along a latitudinal gradient that runs along the x-axis with the most northern region on the left.
