## ABSTRACT

Thompson, P.C., L.E. Anderson, and H.R. Ellison. 1988. Angler catch and fishing effort data from the 1983 and 1984 angler diary pilot study at Plummer's Great Slave Lake Lodge, N.W.T. Can. Data Rep. Fish. Aquat. Sci. 710: iv +12 p.

Data are presented from a two year pilot study designed to test an angler diary program as an alternative to the standard creel census method of collecting angler fishing effort and catch data and to determine its cost effectiveness. Angler response rates were $63 \%$ in 1983 and $59 \%$ in 1984. Respondents reported a total of 6321 hours of fishing effort in 1983 and 6375 hours in 1984. The 1983 respondents caught a total of 4193 fish while in 1984, 4740 fish were caught by respondents. Average catch per angler hour was 0.65 fish in 1983 and 0.72 fish in 1984.

All guests at the lodge are estimated to have spent 11755 hours fishing in 1983 and 13926 hours fishing in 1984. An estimated 7798 fish were caught in 1983 and 10355 fish were caught in 1984.

Key words: angler diary; angling; catch/effort; sport fishing; sport fishing statistics.

## RÉSUMÉ

Thompson, P.C., L.E. Anderson, and H.R. Ellison. 1988. Angler catch and fishing effort data from the 1983 and 1984 angler diary pilot study at Plummer's Great Slave Lake Lodge, N.W.T. Can. Data Rep. Fish. Aquat. Sci. 710: iv +12 p.

On présente les données d'une étude pilote d'une durée de deux ans visant à déterminer si le carnet du pécheur pourrait constituer une solution de rechange aux relevés standard de pêche sportive pour la collecte de données sur les captures et l'effort de pêche et à déterminer la rentabilité de cette mesure. Le taux de réponse des pêcheurs a été de $63 \%$ en 1983 et de $59 \%$ en 1984. Les carnets révèlent un effort de pêche total de 6321 heures en 1983 et de 6375 heures en 1984, et des captures totales de 4193 poissons en 1983 et de 4740 poissons en 1984. Le taux de capture moyen par heure de pêche a été de 0,65 poisson en 1983 et de 0,72 en 1984 .

On estime le nombre total d'heures de pêche pour l'ensemble des pêcheurs qui ont fréquenté le camp, à 11755 en 1983 et 13926 en 1984. Le nombre de poissons capturés est évalué à 7798 en 1983 et 10355 en 1984.

Mots-clés: journal de pêche sportive; pêche à la ligne; prises/effort; pêche sportive; statistiques de pêche sportive.

## INTRODUCTION

During the open water fishing seasons of 1983 and 1984, the Department of Fisheries and Oceans, Central and Arctic Region, undertook a pilot study at Plummer's fishing lodge on Great Slave Lake, N.W.T. to test an angler diary as an alternative to the standard creel census method of collecting angler catch and effort data and to determine which method is more cost effective.

## METHODS

The methods used in this study are outlined in detail in Thompson et al. (1988). A diary was given to every guest at the lodge throughout the summer seasons of 1983 and 1984. Those who chose to participate recorded the number of hours spent fishing and the number of fish caught, kept, released and used for shore lunch in their diaries. These data were recorded by specific areas within the part of Great Slave Lake used by the lodge, and by species. The angler diary contained a map showing these areas (See Fig. 1 and Fig. 2). Five areas were used in 1983, but because of the large number of errors associated with recording information by area, the map was simplified to only three areas in 1984.

Two hundred and sixty-eight (63\%) and 263 (59\%) guests turned in diaries in 1983 and 1984 respectively. However, only 222 in 1983 and 201 in 1984 were filled out completely and could be used for estimating average angler activity and success. The sample data reported in the tables that follow represent the catch and effort of only those respondents who filled out their diaries completely.

A ratio estimator was used to estimate the total catch and effort of all guests at the lodge in each year. This is also described in detail in Thompson et al. (1988).

## RESULTS

It was estimated that the 423 guests at Plummer's Great Slave Lake Lodge fished a total of 11754 hours and caught 7798 fish. In 1984, there were 446 guests at the lodge and they were estimated to have fished 13926 hours and to have caught 10355 fish.

Tables 1 to 14 summarize the data reported in the diaries. Catch data is presented by species and by the number of fish "Kept" to take home, eaten for "Shore Lunch" or "Released". In Tables 5 and 6, catches are separated further into "Targeted Catch" and "Incidental Catch". Numbers shown under the "Incidental Catch" column indicate the number of other species of fish caught while fishing for the "targeted" species. For example, if an angler was fishing for lake trout and caught a northern pike, that northern pike would be shown as an incidental catch. Any lake trout caught would be the targeted catch.

Tables 15 to 18 show the population estimates in detail. Also shown are the 95\% confidence intervals associated with the estimated total angler hours and harvests. Nineteen times out of 20 the population value will fall within this interval.

## ACKHOWLEDGMENTS

The authors would like to thank D. Topolniski for assisting in the planning and operation of the angler diary pilot study. R. Moshenko and M. Kingsley provided useful comments on this report. B. Quint designed the data entry program used in the study and R. Lypka assisted in the computer programming. In addition, statistical advice was provided by K. Brickley, DFO, Ottawa and L. Neden of the University of Manitoba.
