ABSTRACT

Winther, I., S.K. Bachen and R.D. Goruk. 1990. Docee River counting fence. 1989 Operations. Can. Data Rep. Fish Aquat. Sci. 796. iii + 11 p.

The Docee River Counting Fence (Central Coast, B.C.) was operated from July 4 to August 6 of 1989. Managers operating the Smiths Inlet sockeye fishery use the inseason sockeye escapement data provided by the fence. In 1989, 163,804 sockeye were counted through the fence. Length and sex data were collected from 116 Docee River sockeye and age data were collected from 109 of these fish. Age 5₂ sockeye composed 41% of the fish sampled and had a mean hypural length of 51.7 cm. Age 4₂ sockeye composed 59% of the fish sampled and had a mean length of 44.9 cm. Mean hypural length was the same between sexes of the same age. The sex ratio of all fish sampled was approximately 2.3:1. Fence and camp maintenance and operations are described.

RESUME

Winther, I., S.K. Bachen and R.D. Goruk. 1990. Docee River counting fence. 1989 Operations. Can. Data Rep. Fish Aquat. Sci. 796. iii + 11 p.

La barrière de comptage de la rivière Docee (dans la zone centrale du littoral de la Colombie-Britannique) a été en opération du 4 juillet au 6 août 1988. Les gestionnaires de la pêche au saumon rouge de l'inlet Smith utilise les données saisonnières d'échappée recueillies à la barrière. La longueur et le sexe de 116 saumons rouges de la rivière Docee ont été déterminés de même que l'âge de 109 saumons. Les saumons rouges d'âge 5₂ représentaient 41 % des poissons échantillonnés et avaient une longueur à l'hypural de 51.7 cm tandis que le groupe d'âge 4₂ formait 59% des poissons et avaient une longueur moyenne de 44.9 cm. Les longueurs moyennes à l'hypural des mâles et des femelles de même âge étaient identiques. La proportion des sexes pour l'ensemble des poissons échantillonnés était de 2.3:1. Les opérations de maintenance de la barrière et des installations sont aussi décrites dans cet article.

INTRODUCTION

The Docee River is located in the Central Coast District of British Columbia within Canadian Department of Fisheries and Oceans Statistical Area 10 (Fig. 1). The Docee River is less than 1 km long, draining Long Lake into Wyclees Lagoon. Wyclees Lagoon empties North into Smith Inlet.

The Docee River counting fence has been in operation since 1972. Sockeye escapements into Long Lake have been monitored to provide in season estimates to Managers of the Smith Inlet sockeye fishery. The counting fence operates from late June or early July to mid August.

METHODS

The Docee River Camp was opened June 29 and closed August 6, 1989. Supplies and equipment were transported by boat from Prince Rupert, Dawsons Landing and Machmell Camp to the float in Wyclees Lagoon June 26 to 28, 1989. Supplies were transported from the float to the camp with an all terrain vehicle (ATV) and trailer.

FENCE MAINTENANCE & OPERATION

A jet boat and chain saw were used to clear logs and debris from the river and the lower lake. A shear boom was positioned across the mouth of the river to prevent debris from drifting into the river and fouling the fence.

Before the fence frames were lowered into the river, the counting panels were cleaned and repainted. The frames were first lowered July 2. Rocks were moved with pike poles and/or cable straps to level the frames and reduce the number of holes under the fence. Holes under the fence were plugged with sand bags filled with rocks. The fence was not operational until July 4 at 14:00.

Winches, pulleys and cables were repaired or replaced as necessary. The large pulley wheels for lowering the fence frames were painted. Debris was cleared from the fence daily. Holes under the fence were plugged with sand bags as they were discovered.

Fish were counted through the fence by a two man crew working one hour shifts as described by Thompson and Goruk (1988). Counts were made from July 4 to August 6.

Dead fish caught in the fence were collected and sampled. Samples consisted of hypural length, sex and scales. Scales were collected onto scale books and sent to the Scale lab in Vancouver.

CAMP MAINTENANCE

Repairs to the cabin were minimal in 1989. A pump was installed to improve water pressure in the cabin plumbing. Representatives of the Department of Public Works (DPW) identified

\$22,400 of repairs to upgrade the Docee River cabin to meet health and safety requirements. It may be more cost effective to build a new structure than upgrade the old one.

The grounds around the camp, the garbage dump and the road were cleared with a brushing machine and machetes.

The skidder road from Wyclees Lagoon to the camp was too narrow for the ATV and trailer. Stumps were removed from a portion of the road by blasting. Logs and roots remaining after blasting were cut with a chain saw. The road is still in poor condition. The decking on the hill near the camp is smashed and needs to be replaced. Decking would not be required if the road was widened and cut into the hill further. Blasting or heavy machinery is needed to do this.

RESULTS & DISCUSSION

Weather conditions and water levels recorded at the Docee River Fence are shown in Table 1 (Fig. 2).

Sockeye were counted through the Docee River fence shortly after it was installed on July 4. The relatively low numbers at the beginning of the count would suggest few sockeye had ascended the river into Long Lake before the fence was installed. Daily counts were erratic with maxima of 14,732 and 13,635 sockeye through the fence on July 18 and July 31 respectively (Fig. 3). Low counts expressed as a flattening of the cumulative count curve (Fig. 4) are likely the result of commercial fisheries. Daily and cumulative counts of sockeye and chinook appear in Table 2. Sockeye fisheries were held in Smith Inlet July 2-3, 9-10, and 16-17. Catches appear in Table 3. Fisheries affect sockeye counts through the fence from 1 day after the fishery opens to 6 days after it closes.

A total of 163,804 sockeye were counted through the Docee River fence. Sockeye escapement to Long Lake was estimated at 166,804. The commercial gillnet fishery caught 63,209 sockeye and the Indian food fishery caught 149 sockeye for a total of 63,358 fish harvested. The total Long Lake stock was 227,162 sockeye.

Samples were collected from 116 sockeye from which 109 were aged. Length frequencies broken down by age and sex appear in Table 4. Age 4₂ fish made up 59 % of the sample and age 5₂ fish made up 41 % of the sample. The male:female ratio was 2.3:1. Differences in mean hypural length between sexes of the same age were negligible. Mean hypural lengths of age 4₂ and 5₂ sockeye (males and females combined) were 44.9 cm and 51.7 cm respectively.
