Canadian Data Report of Fisheries and Aquatic Sciences

Data reports provide a medium for filing and archiving data compilations where little or no analysis is included. Such compilations commonly will have been prepared in support of other journal publications or reports. The subject matter of data reports reflects the broad interests and policies of the Department of Fisheries and Oceans, namely, fisheries and aquatic sciences.

Data reports are not intended for general distribution and the contents must not be referred to in other publications without prior written authorization from the issuing establishment. The correct citation appears above the abstract of each report. Data reports are abstracted in *Aquatic Sciences and Fisheries Abstracts* and indexed in the Department's annual index to scientific and technical publications.

Numbers 1-25 in this series were issued as Fisheries and Marine Service Data Records. Numbers 26-160 were issued as Department of Fisheries and the Environment, Fisheries and Marine Service Data Reports. The current series name was introduced with the publication of report number 161.

Data reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page. Out-of-stock reports will be supplied for a fee by commercial agents.

Rapport statistique canadien des sciences halieutiques et aquatiques

Les rapports statistiques servent à classer et à archiver les compilations de données pour lesquelles il y a peu ou point d'analyse. Ces compilations auront d'ordinaire été préparées à l'appui d'autres publications ou rapports. Les sujets des rapports statistiques reflètent la vaste gamme des intérêts et des politiques du ministère des Pêches et des Océans, c'est-à-dire les sciences halieutiques et aquatiques.

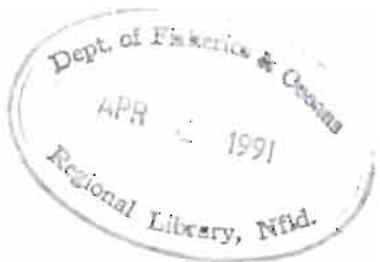

Les rapports statistiques ne sont pas destinés à une vaste distribution et leur contenu ne doit pas être mentionné dans une publication sans autorisation écrite préalable de l'établissement auteur. Le titre exact paraît au-dessus du résumé de chaque rapport. Les rapports statistiques sont résumés dans la revue *Résumés des sciences aquatiques et halieutiques*, et ils sont classés dans l'index annuel des publications scientifiques et techniques du Ministère.

Les numéros 1 à 25 de cette série ont été publiés à titre de relevés statistiques, Services des pêches et de la mer. Les numéros 26 à 160 ont été publiés à titre de rapports statistiques du Service des pêches et de la mer, ministère des Pêches et de l'Environnement. Le nom actuel de la série a été établi lors de la parution du numéro 161.

Les rapports statistiques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre. Les rapports épuisés seront fournis contre rétribution par des agents commerciaux.

ABSTRACT

This data report contains all the daily and cumulative counts for all salmon species and steelhead trout passing through the Meziadin River fishway. Age, sex and length information for sockeye sampled at the Meziadin Fishway, Bonnie Creek, Bowser and Damdochax Lakes is also presented.

In 1990, 120,954 large sockeye and 3,004 jack sockeye were enumerated at the Meziadin Fishway. In addition, 759 large chinook, 250 jack chinook, 2,029 coho, 18 pink and 81 steelhead were also counted.

Estimates for the sockeye escapement for the Upper Nass systems are also presented.

RESUME

Le présent rapport porte sur les denombrements quotidiens et cumulatifs de toutes les espèces de saumon et de truite arc-en-ciel anadrome qui empruntent la passe migratoire de la rivière Meziadin. Il contient également des données sur l'age, le sexe et la longueur des saumons rouges échantillonnes à la passe migratoire de Meziadin, à Bonnie Creek, et aux lacs Bowser et Damdochax.

En 1990, on a dénombré, dans la passe migratoire de Meziadin, 120 954 gros saumons rouges et 3 004 jeunes saumons rouges, de même que 759 gros quinnats, 250 jeunes quinnats, 2 029 cohos, 18 saumons roses et 81 truites arc-en-ciel anadromes.

On présente aussi des estimations de l'échappée de saumon rouge dans le réseau supérieur de la Nass.

Introduction

The Meziadin River flows into the Nass River approximately 180 km from where the Nass River flows into Portland Inlet in Statistical Area 3 (see Figure 1). The fishway is situated 1 km from the confluence of the Meziadin and Nass Rivers. The fishway was constructed to bypass a series of falls (Victoria Falls) and allow returning adult salmon better access to spawning grounds on Meziadin Lake and tributaries. It is estimated that the Meziadin system produces 70 to 80% of the total Nass sockeye stock. In 1990 there were 120,954 sockeye enumerated at the fishway which represents 77% of the estimated escapement of 155,442.

Methods

The Meziadin Fishway was designed to operate either unmanned or accommodate enumeration facilities and personnel. The trap was installed on July 5 and the first sockeye was counted on July 6. Daily enumeration of all species and biological sampling (sockeye) was carried on throughout the program using standard methods as described by Southgate et al. (1988). The program continued until September 13, 1990.

Prior to the start of the 1990 program, maintenance on the fishway was completed. This included removing a build-up of gravel from the top end of the fishway where the counting trap is installed. A tracked excavator was used to remove the gravel. The panels that make-up the trap were then positioned in place before another gravel build-up could occur. Stop logs, 10 feet upstream from the trap, have also been installed, hopefully to prevent any further build-up of gravel in and around the trap.

The handrail along the fishway was extended and now encloses the counting trap, providing safety protection for both DFO personnel and tourists.

Upper Nass Survey

The annual survey of upper Nass River sockeye systems was conducted between September 11 and September 13, 1990. These sockeye systems include Fred-Wright (Bonnie Creek and Upper Kwinagese), Bowser and Damdochax Lakes. Access to these areas is via float plane. Methods used in surveying have been previously described by Todd and Dickson (1970).

Bowser Lake

Bowser Lake, the second largest Nass sockeye producer was sampled on September 12 when 218 sockeye were gillnetted for sampling. The population estimate is calculated through an analysis of scale characteristics described by Todd and Dickson (1970). Of the 218 fish sampled, scale information from 208 was obtained; the remainder of the information being lost due to scale deterioration. The population estimate for Bowser Lake in 1990 is 15,688.

Fred-Wright Lake

Fred-Wright Lake has two major spawning areas, Bonnie Creek and the upper Kwinagese River. Population estimates are derived from visual counts from aircraft and by walking the creeks. Biological samples were also taken at Bonnie Creek. Sampling and stream enumeration were conducted on September 11. The population estimate for the Fred-Wright system in 1990 is 14,000 sockeye.

Damdochax Lake

Damdochax Lake is the smallest producer of sockeye in the Nass System. Population estimates are conducted by visual counts via float plane. The 1990 survey was conducted September 13. The escapement estimate was 4,000 and 100 sockeye were sampled for biological information.

Results

Water level measurements taken at the fishway during 1990 are recorded in Figure 2. The total large sockeye count for 1990 was 120,954 and 3,004 jack sockeye. The chinook count for 1990 was 759 large and 250 jack chinook. There were also 2,029 coho, 81 steehead and 18 pinks counted through the fishway. The daily and accumulative counts for all species are presented in Tables I to III. The Figures III to VIII give the daily counts in graphed form. In 1990, 1,400 sockeye were sampled for biological information: sex, length, fin-clip and scales. This information is presented in Table IV. The biological information from Bowser, Damdochax, and Fred-Wright Lakes is shown in Tables V, VI, and VII. The age composition and length information for the Meziadin fishway is presented in Tables VIII and IX. The age composition and length information for the upper Nass Systems is found in Tables X and XI.

	F	1	0	162	19.2	69	8.2	509	60.3	103	12.2	844

Note: Any discrepancy in the percentages are due to rounding error.
Where the summary total indicates less than fourteen hundred fish sampled,
this is due to scale sample inadequacies resulting in the loss of
information.

Table IX
Average length information for sockeye salmon sampled at Meziadin
Fishway by day, sex and age.

Acknowledgements

The author would like to thank Dwyane McInnis and Jim Hansen for their dedication and perseverance at the Meziadin Fishway for a job well done. The author would also like to thank Les Jantz, Jim Steward (DFO), and Lou Debuc (Lakes District Air) for conducting the upper Nass Survey.

Special thanks to Bea Lapp for her assistance in the final preparations of this report.
