Canadian Technical Report of Fisheries and Aquatic Sciences

These reports contain scientific and technical information that represents an important contribution to existing knowledge but which for some reason may not be appropriate for primary scientific (i.e. *Journal*) publication. Technical Reports are directed primarily towards a worldwide audience and have an international distribution. No restriction is placed on subject matter and the series reflects the broad interests and policies of the Department of Fisheries and Oceans, namely, fisheries management, technology and development, ocean sciences, and aquatic environments relevant to Canada.

Technical Reports may be cited as full publications. The correct citation appears above the abstract of each report. Each report will be abstracted in *Aquatic Sciences and Fisheries Abstracts* and will be indexed annually in the Department's index to scientific and technical publications.

Numbers 1-456 in this series were issued as Technical Reports of the Fisheries Research Board of Canada. Numbers 457-714 were issued as Department of the Environment, Fisheries and Marine Service, Research and Development Directorate Technical Reports. Numbers 715-924 were issued as Department of Fisheries and the Environment, Fisheries and Marine Service Technical Reports. The current series name was changed with report number 925.

Details on the availability of Technical Reports in hard copy may be obtained from the issuing establishment indicated on the front cover.

Rapport technique canadien des sciences halieutiques et aquatiques

Ces rapports contiennent des renseignements scientifiques et techniques qui constituent une contribution importante aux connaissances actuelles mais qui, pour une raison ou pour une autre, ne semblent pas appropriés pour la publication dans un journal scientifique. Il n'y a aucune restriction quant au sujet, de fait, la série reflète la vaste gamme des intérêts et des politiques du Ministère des Pêches et des Océans, notamment gestion des pêches, techniques et développement, sciences océaniques et environnements aquatiques, au Canada.

Les Rapports techniques peuvent être considérés comme des publications complètes. Le titre exact paraîtra au haut du résumé de chaque rapport, qui sera publié dans la revue *Aquatic Sciences and Fisheries Abstracts* et qui figurera dans l'index annuel des publications scientifiques et techniques du Ministère.

Les numéros 1-456 de cette série ont été publiés à titre de Rapports techniques de l'Office des recherches sur les pêcheries du Canada. Les numéros 457-714, à titre de Rapports techniques de la Direction générale de la recherche et du développement, Service des pêches et de la mer, ministère de l'Environnement. Les numéros 715-924 ont été publiés à titre de Rapports techniques du Service des pêches et de la mer, Ministère des Pêches et de l'Environnement. Le nom de la série a été modifié à partir du numéro 925.

La page couverture porte le nom de l'établissement auteur où l'on peut se procurer les rapports sous couverture cartonnée.

We would like to acknowledge the helpful suggestions and comments of R. W. Trites. Also thanks are due to R. W. Trites and B. Petrie for reviewing the original report.

ABSTRACT

Drinkwater, Ken and George Taylor. 1982. Monthly means of the temperature, salinity and density along the Halifax Section . Can. Tech. Rep. Fish. Aquat. Sci. xxxx.

Monthly means of the temperature, salinity and density along the Halifax Section, calculated from data collected approximately once per season from 1950 to 1977, are presented.

RESUME

Les moyennes mensuelles de la température, de la salinité et de la densité sont calculées pour la section d'Halifax à partir de données récoltées chaque saison de 1950 à 1977 et sont présentées dans ce rapport.

Introduction

From 1950 to 1977 a hydrographic transect known as the Halifax Section was run southeastward from Halifax, Nova Scotia across the Scotian Shelf on approximately a seasonal basis by Canadian oceanographers. Most of these data are contained in Taylor (1961, 1966), de la Ronde (1972) and Dobson (1975, 1977, 1978). This report presents the monthly means of the temperature, salinity and density (σ_t) along this section.

Data

From 1950 to 1968 the Halifax Section consisted of 7 stations (Table I, Fig. 1) stretching to a maximum 230 km off the Nova Scotia coastline. Eleven additional stations were occupied between December 1968 and January 1971 (de la Ronde 1972) while between 1974 and 1977 this was reduced to 5 additional stations (Dobson 1975). Only data taken at the sites of the original seven stations are considered within this report. These stations generally contain the most data and are sufficient to indicate the basic features of the seasonal hydrographic changes over the Scotian Shelf.

Prior to 1967 data were collected at standard depths using Knudsen bottles and reversing thermometers. From 1967 onward a continuous profiling CTD was used.

For this report, data up to 1972 was obtained from the Marine Environmental Data Service (MEDS) in Ottawa. All data within .05 of a degree square of the positions in Table 1 were used. No USSR data were included, being unavailable at the time of the original request for data from MEDS. Data from 1974-77 were taken directly from Dobson (1975, 1977, 1978). Cruise 74-034, as reported by Dobson (1975), was not included due to poor quality data.

The approximate temporal coverage of the Halifax Section by year and month is shown in Fig. 2. Each transect in Fig. 2 represents an occupation of a minimum of four of the original seven stations of which there were a total of 95 such transects between 1950 and 1977. The data set for each individual station differs slightly from that in Fig. 2.

Analysis

Monthly means and standard deviations of the temperature, salinity and density (σ_t) were calculated at standard depths from 0 to 500 m (where possible) for each of the seven Halifax Section stations. These values are listed in Appendix I together with the total number of observations. Salinities are reported in the Practical Salinity Scale in accordance with the International System of Units (SI units). Note a sample of seawater with a salinity of .00335 (33.5‰) has a practical salinity of 33.5. The average temperature, salinity and density along the Halifax Section for each month are plotted in Fig. 3. The time-depth distribution of the means are shown for each station in Fig. 4. Fig. 5 shows the seasonal variation of the means and their standard deviations at each station for 0 m, 50 m and, where possible, 200 m. T,S diagrams showing the seasonal variations of the means at selected depths for each station are plotted in Fig. 6. Finally, the entire Halifax Section data set is plotted seasonally as T,S diagrams (Fig. 7). These indicate the range within which the T,S data fall. Note the density of T,S points does not represent water volume as a larger proportion of the number of observations were taken in the near-surface layer.

Analysis of year to year changes in the temperature or salinity properties along the Halifax section has not been attempted using the present data set. The once per season coverage is insufficient to adequately resolve yearly differences. The changes in temperature or salinity that occur due to the tides, wind storms,

internal waves, etc. are often as large or larger than those that occur from year to year. This 'aliasing' of the low frequency by higher frequency events has been discussed in regards to the Halifax Section data by Mann and Needler (1967) and later by Mann (1969) and Drinkwater et al. (1979).
