ABSTRACT

Wildish, D. J., D. L. Peer, A. J. Wilson, J. Hines, L. Linkletter, and M. J. Dadswell. 1983. Sublittoral macro-infauna of the upper Bay of Fundy. Can. Tech. Rep. Fish. Aquat. Sci. 1194: iii + 64 p.

Lists of species and species/density/biomass matrices are given for two benthic sampling surveys in the upper Bay of Fundy. The Chignecto Bay sampling in August 1978 included 95 stations and 137 taxa identified to species, while the Minas Basin sampling completed in August 1979 involved 73 stations and 126 identified species.

Key words: Macro-benthos, species, density, biomass, Bay of Fundy

RÉSUMÉ

Wildish, D. J., D. L. Peer, A. J. Wilson, J. Hines, L. Linkletter, and M. J. Dadswell. 1983. Sublittoral macro-infauna of the upper Bay of Fundy. Can. Tech. Rep. Fish. Aquat. Sci. 1194: iii + 64 p.

Le présent rapport contient une liste des espèces et matrices espèces/densité/biomasse de deux relevés de la faune benthique dans le haut de la baie de Fundy. L'échantillonnage de la baie Chignectou en août 1978 comprenait 95 stations et 137 taxa identifiés à l'espèce. Celui du bassin des Mines, terminé en août 1979, a couvert 73 stations et noté 126 taxa identifiés à l'espèce.

INTRODUCTION

We present here the taxonomic, density and biomass data for two benthic cruises in the upper Bay of Fundy (Chignecto Bay and Minas Basin). This represents the final field work in our attempt to systematically map the heterotrophic benthic production of the Bay of Fundy.

The objectives and organization of this work are outlined in a previous report (Peer et al. 1980) which presents similar raw data from the lower Bay of Fundy. One analysis of the lower Bay data has already been presented (Wildish and Peer 1983). Our primary purpose in tabulating raw data is to allow hindsight corrections that may become necessary as our meagre knowledge of benthic biology increases. For example, corrections to trophic group classifications or to estimated average life-spans will undoubtedly be made. At the moment, these are little better than educated guesses since lifespan and life-history data of many species have not been systematically investigated.

After multiplying by an annual turnover ratio (P:B), biomass data given in this report can be used to estimate production for a given species at a given station. Two methods to do this are available, based on literature reviews of empirical data: that of Robertson (1979) which depends on the inverse log relationship between lifespan (x) and P:B (y):

$$\log_{10} y = 0.66 - 0.726 \log_{10} x$$

and that of Banse and Mosher (1980) for temperate-zone invertebrates, excluding insects, with annual mean temperature of about 5-20°C:

$$\log y = -0.21 + -0.37 \log B$$

where B is the mature biomass in Kcal. Difficulties encountered in applying these methods include determining individual population lifespans for all demes in the geographical area considered and knowing the age/mass threshold which separates immature from mature individuals in a given population. Nevertheless, we believe the effort to be worth while since it should allow the first crude estimate of production for the upper Bay of Fundy to be made.

METHODS

CHIGNECTO BAY

Benthic samples were collected with a 0.1-m^2 Van Veen grab deployed from CSS DAWSON between Aug. 4-22, 1978. A single sample was taken at each of 95 stations which were approximately 3 km apart (Fig. 1). A record was kept of the quantity as volume of sediment taken in each grab sample (Appendix 1).

A subsample was removed for grain size distribution and determination of carbon/nitrogen values (reported elsewhere) and the remainder sieved on deck with running seawater through a 0.8-mm mesh to retain the macro-infauna. Animals were preserved in 10% formalin in sea water and, on return to the laboratory, sorted into species, genera or family groups, weighed and counted before taxonomic verification in the Identificaton Centre, St. Andrews.

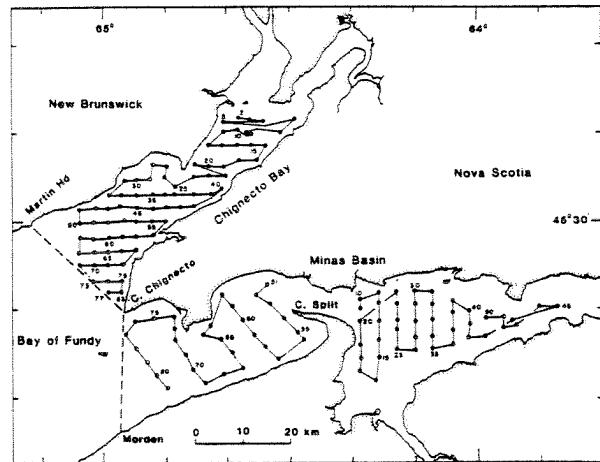

Fig. 1. Map of the upper Bay of Fundy showing the cruise tracks in Chignecto Bay and Minas Basin.

The area northwest of the line joining Martin Head and Cape Chignecto was arbitrarily set as within the upper Bay of Fundy and was found by planimetry to be 922 km^2 at low water and 1099 km^2 at high water. This arbitrary division of upper and lower Bay excludes 17 stations from consideration as part of the upper Bay, although the data are included for comparative purposes with previously obtained lower Bay of Fundy data (Peer et al. 1980).

MINAS BASIN

Benthic samples were collected with either a 0.1-m^2 or 0.5-m^2 Van Veen grab from Aug. 11-18, 1979, on the CSS DAWSON. Duplicate grab samples of 0.1 m^2 or single ones of 0.5-m^2 area were taken at 73 stations throughout the Basin (Fig. 1). All of the 0.5 m^2 samples taken were presumed to be valid ones, containing greater than 60% by volume of sediment.

Further treatment of the grab samples involved the same procedures as for Chignecto Bay after pooling of the 0.1-m^2 samples.

The portion of the Basin within the upper Bay of Fundy was arbitrarily set as eastwards of a line joining Cape Chignecto and Morden (Fig. 1), an area 1627 km^2 at low water and 2010 km^2 at high-water mark.

RESULTS AND DISCUSSION

The locations of the sampling stations in Chignecto Bay are shown in Fig. 1 and Appendix 1. The Minas Basin sampling locations in Fig. 1 and Appendix 2. Appendices 1 and 2 include data on depth of sampling and individual grab quality where this information is available.

The species list for Chignecto Bay (Appendix 3) includes 137 taxa fully identified to species with an additional 39 taxa partially identified. The list for Minas Basin includes 126 fully identified taxa (Appendix 4) with 60 partially identified taxa.

The species list in Appendix 3 refers to data from 95 stations (0.1-m^2 sample), of which 78 are in the upper Bay. The list in Appendix 4 refers to 73 stations most of which are 0.5-m^2 samples and all within the upper Bay.

Chignecto Bay and Minas Basin have comparable species diversity, but both have lower benthic species diversity than the lower Bay where 212 fully identified species were found for an effort of 98 duplicate 0.1-m^2 samples (Peer et al. 1980). Of course, the area of the lower Bay (8620 km^2) is greater than that of the upper Bay (3109 km^2) and may thus contain a wider range of niches.

Sediment data collected during both cruises are presented elsewhere (Amos and Long 1980; Amos and Asprey 1979) and may aid in interpreting benthic distributions.

Four dominant species were present in the lower Bay (Peer et al. 1980) as "key" species. Of these, Modiolus modiolus is present in the upper Bay at densities and biomasses comparable to those found in the lower Bay; Haploops fundiensis is absent from Minas Basin but present in Chignecto Bay at 16 different stations, with a maximum density of 80 individuals/ m^2 ; Sternaspis scutata is absent from Minas Basin and rare in Chignecto Bay (2 stations); and Terebratulina septentrionalis is absent from Minas and rare in Chignecto Bay (3 stations). Two amphipods are common and "key" species throughout the upper Bay, Unciola irrorata and Leptocheirus pinguis, and reach extremely high densities at some stations.

The obvious faunal differences between the upper and lower Bay may be generally related to the estuarine nature of the upper Bay which is more extreme in, for example, turbidity, current speed, and salinity changes.

ACKNOWLEDGMENTS

We thank the Captain and crew of the CSS DAWSON, Dr. D. Gordon for help in obtaining the samples and R. Hoar and B. Frost for expert help in preparing the appendices for publication.

84. <u>L. acuta</u> (Verrill, 1875)	4	2.0
85. <u>Lumbrinereidae</u> indetermin.	4	2.0
86. <u>Ninoe nigripes</u> Verrill, 1873	2	2.0
87. <u>Drilonereis magna</u> Webster & Benedict, 1887	4	2.0
88. <u>Orbiniidae</u> indetermin.	2	2.0
89. <u>Scoloplos armiger</u> (Muller, 1776)	2	2.0
90. <u>S. acutus</u> (Verrill, 1873)	2	1.0
91. <u>Scoloplos</u> indetermin.	2	2.0
92. <u>Orbinia swani</u> Pettibone, 1957	2	2.0
93. <u>Cirratulidae</u> indetermin.	2	2.0
94. <u>Ampharete acutifrons</u> (Grube, 1860)	2	2.0
95. <u>A. arctica</u> Malmgren, 1866	2	2.0
96. <u>Ampharete</u> indetermin.	2	2.0
97. <u>Melitta cristata</u> (Sars, 1851)	2	2.0
98. <u>Terebellidae</u> indetermin.	2	3.0
99. <u>Amphitrite figulus</u> (Dalyell, 1853)	2	3.5
100. <u>A. cirrata</u> Muller, 1771	2	3.0
101. <u>Trichobranchus glacialis</u> Malmgren, 1866	2	2.0
102. <u>Terrebellides stroemi</u> Sars, 1835	2	1.0
103. <u>Polycirrus eximius</u> (Leidy, 1855)	2	3.0
104. <u>P. medusa</u> Grube, 1850	2	3.0
105. <u>Polycirrus</u> indetermin.	2	3.0
106. <u>Nicolea venustula</u> (Montagu, 1818)	2	5.0
107. <u>Streblosoma spiralis</u> (Verrill, 1894)	2	3.0
108. <u>Pherusa plumosa</u> (Muller, 1776)	2	5.0
109. <u>P. affinis</u> (Leidy, 1855)	2	2.0
110. <u>Brada villosa</u> (Rathke, 1843)	2	3.0
111. <u>Sabellidae</u> indetermin.	1	1.0
112. <u>Chone dunieri</u> Malmgren, 1867	1	1.0
113. <u>Chone</u> indetermin.	1	1.0
114. <u>Potamilla neglecta</u> (Sars, 1851)	1	1.0
115. <u>P. reniformis</u> (Leukart, 1849)	1	1.0
116. <u>Myxicola infundibulum</u> (Renier, 1804)	1	1.0
Annelida, Oligochaeta		
117. <u>Tubificidae</u> indetermin.	2	1.0

Cirratulidae probably includes Chaetozone, Tharyx, and Caulieriella.

APPENDIX 4

Species list and species/station matrix for Minas Basin, August 1979. Density is given as number per 0.5 m² (except for stations G25-G29 where it is 0.2 m²) and wet formalin weight in grams in brackets. No correction is made in the biomass values shown.

	Trophic type	Lifespan yr ⁻¹
Porifera		
1. <u>Haliclona</u> indetermin.	1	5.0
Cnidaria, Anthozoa		
2. <u>Actinaria</u> indetermin.	1	5.0
3. <u>Edwardsia</u> indetermin.	1	5.0
