Canadian Technical Report of Fisheries and Aquatic Sciences

Technical reports contain scientific and technical information that contributes to existing knowledge but which is not normally appropriate for primary literature. Technical reports are directed primarily toward a worldwide audience and have an international distribution. No restriction is placed on subject matter and the series reflects the broad interests and policies of the Department of Fisheries and Oceans, namely, fisheries and aquatic sciences.

Technical reports may be cited as full publications. The correct citation appears above the abstract of each report. Each report is abstracted in *Aquatic Sciences and Fisheries Abstracts* and indexed in the Department's annual index to scientific and technical publications.

Numbers 1-456 in this series were issued as Technical Reports of the Fisheries Research Board of Canada. Numbers 457-714 were issued as Department of the Environment, Fisheries and Marine Service, Research and Development Directorate Technical Reports. Numbers 715-924 were issued as Department of Fisheries and the Environment, Fisheries and Marine Service Technical Reports. The current series name was changed with report number 925.

Technical reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page. Out-of-stock reports will be supplied for a fee by commercial agents.

Rapport technique canadien des sciences halieutiques et aquatiques

Les rapports techniques contiennent des renseignements scientifiques et techniques qui constituent une contribution aux connaissances actuelles, mais qui ne sont pas normalement appropriés pour la publication dans un journal scientifique. Les rapports techniques sont destinés essentiellement à un public international et ils sont distribués à cet échelon. Il n'y a aucune restriction quant au sujet; de fait, la série reflète la vaste gamme des intérêts et des politiques du ministère des Pêches et des Océans, c'est-à-dire les sciences halieutiques et aquatiques.

Les rapports techniques peuvent être cités comme des publications complètes. Le titre exact paraît au-dessus du résumé de chaque rapport. Les rapports techniques sont résumés dans la revue *Résumés des sciences aquatiques et halieutiques*, et ils sont classés dans l'index annual des publications scientifiques et techniques du Ministère.

Les numéros 1 à 456 de cette série ont été publiés à titre de rapports techniques de l'Office des recherches sur les pêcheries du Canada. Les numéros 457 à 714 sont parus à titre de rapports techniques de la Direction générale de la recherche et du développement, Service des pêches et de la mer, ministère de l'Environnement. Les numéros 715 à 924 ont été publiés à titre de rapports techniques du Service des pêches et de la mer, ministère des Pêches et de l'Environnement. Le nom actuel de la série a été établi lors de la parution du numéro 925.

Les rapports techniques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre. Les rapports épuisés seront fournis contre rétribution par des agents commerciaux.

iii + 10 p. + Appendix.

ABSTRACT

Zitko, V. 1986. Multidimensional data display by nonlinear mapping. Can. Tech. Rep. Fish. Aquat. Sci. 1428:
iii + 10 p. + Appendix.

This report presents two nonlinear mapping programs. The programs map points from N-space to 2-space, preserving their distances as much as possible. The program OBRAZ performs the conventional nonlinear mapping for 100 points. The program SVETB performs this on 40 points and a simplified nonlinear mapping on any number of points. The programs are written in HP 3000 BASIC and the listings are presented in the appendix.

RÉSUMÉ

Zitko, V. 1986. Multidimensional data display by nonlinear mapping. Can. Tech. Rep. Fish. Aquat. Sci. 1428:
iii + 10 p. + Appendix.

Ce rapport présente deux programmes de cartographie non linéaire. Les programmes portent sur des cartes des points, situés dans des espaces de N à 2 dimensions, en conservant autant que possible les distances qui les séparent. Le programme OBRAZ exécute la cartographie non linéaire classique pour 100 points. Le programme SVETB fait de même pour 40 points et exécute une cartographie non linéaire simplifiée pour un nombre illimité de points. Les programmes sont écrits en HP 3000 BASIC et les listes imprimées sont présentées en annexe.

INTRODUCTION

Relationships and patterns can be seen much faster and easier from graphs than from tables. As the number of dimensions increases, graphic presentation becomes cumbersome. We are restricted to 2-dimensional plots of pairs of variables and to projections of multidimensional graphs into 2 or 3 dimensions.

When one measures "n" properties of a sample, the sample may be represented by a point in an n-dimensional space. If the values of these properties for another sample are similar, the samples are similar and the distance between the two points will be small. To visualize the distances between points in the n-dimensional space, one plots the points in a 2-dimensional space, trying to preserve their distances.

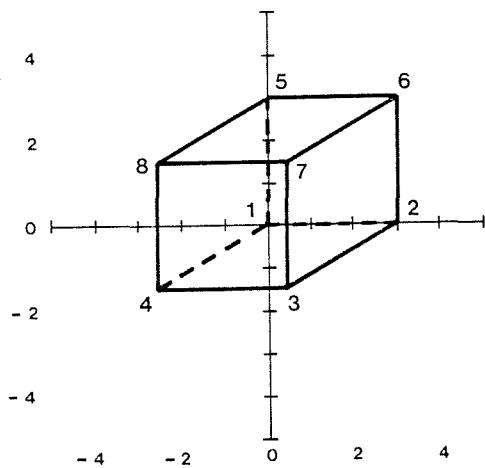

Fig.1 Projection of a cube
The projections of parallel edges are parallel but distances are distorted.
The distance 1-7 is in reality the same as 4-6.

Fig.1 depicts a cube. Since we know what a cube looks like we know that the distance between the vertices 1 and 7 is larger than indicated in Fig.1. Actually, the distance between 1 and 7 is the same as the distance between 4 and 6. The projection does not preserve distances, but parallel lines have parallel projections, and using imagination and experience we obtain a correct perception of the three-dimensional relationships.

Distances are preserved by nonlinear mapping (NLM). Fig.2 is an NLM of a cube. Note that the distances 1-7 and 4-6 are approximately equal. The price to pay is that maps of parallel lines are not

necessarily parallel. Consequently, the shape of objects becomes distorted. On the other hand, since we do not know what a multidimensional object looks like, the distortion is not important. The preservation of distances is, because we are interested in similarities, differences, and patterns, reflected by distances.

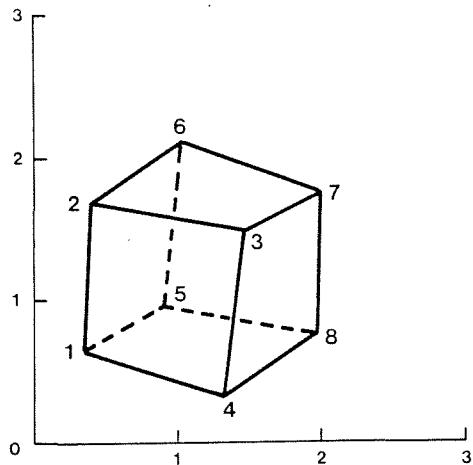

Fig.2. Nonlinear map of a cube.
Parallel edges are not mapped parallel,
but the distances are fairly well preserved:
the distances 1-7 and 4-6 are almost equal
(compare with Fig.1).

NLM was introduced to chemistry by Kowalski and Bender (1972, 1973). For the role of display techniques in information extraction see Derde and Massart (1982) or Massart and Kaufmann (1983).

NLM programs are not available in the common statistical packages. The pattern recognition system ARTHUR (Anon 1985) contains a nonlinear mapping subroutine. Another program is available from the Tektronix library (Anderson 1981). The program OBRAZZ in this report is a translation of this program with input and output modified for convenient use with our current system (HP 3000) in a JOB mode.

There are $N*(N+1)/2$ distances between N points and it does not take too many points to run out of the work area of a computer. The computational effort also becomes exceedingly extensive, since many distances have to be recalculated as a result of each iteration.

A simplified approach was described by Forina et al (1983). A few points (3-10) are selected. These points may or may not be from the data set. They may be special points or could be selected at random. Their best distance-preserving 2-dimensional coordinates are calculated. Since the number of points is small, this is easy in terms of computations. Next, points to be mapped are taken individually and their 2-dimensional coordinates are calculated, preserving the distances to the

basepoints. The distances are weighted so that the basepoints closer to the point in N-space carry more weight. Since the points are mapped individually and in succession, there is no restriction of the number of points to be processed.

The price to pay is the loss of shape perception, as demonstrated in Figs.3-4 for a cube mapped when using different sets of basepoints. The distances of the points are preserved quite well.

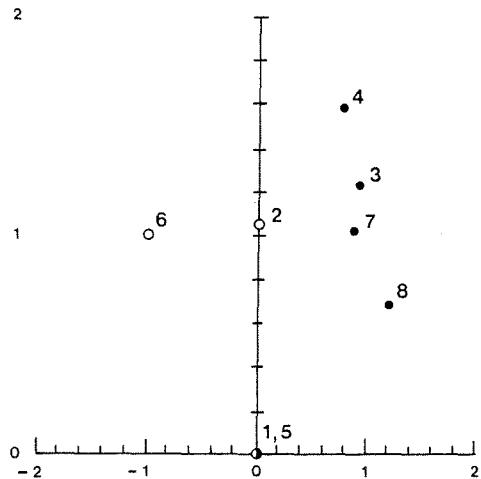

Fig.3. Simplified nonlinear map of a cube. Vertices 1,2, and 6 (see Fig.1) are basepoints (o). The remaining vertices are mapped to preserve their distances to the basepoints.

A program for this algorithm (Simplified Nonlinear Mapping, SNLM) is not readily available in the literature. The program SVETB can perform NLM on a maximum of 40 10-dimensional points or SNLM.

OBRAZJ

This is a translation of the program by Anderson (1981). It reads data from an input file and writes the mapped coordinates to an output file. The input data may be used as such, they may be centered (mean row subtracted), or centered and scaled (mean row subtraction and division by standard deviation).

The program minimizes the value of the error function E:

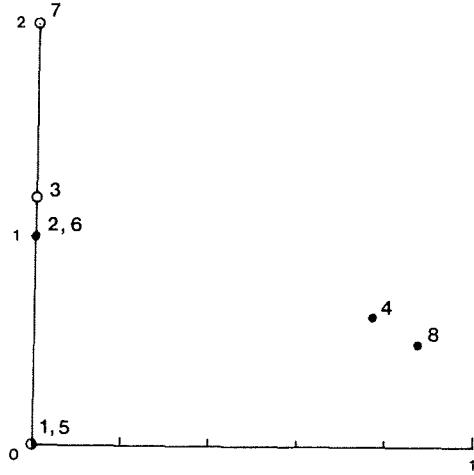

Fig.4. Simplified nonlinear map of a cube. Vertices 1,3, and 7 (see Fig.1) are basepoints (o). The remaining vertices are mapped to preserve their distances to the basepoints.

$$E = 1/\text{SUM}(d) * \text{SUM}((d - d^*)^2/d),$$

where SUM is summation for all distances between points i,j at $i < j$
 d, d^* are the distances in N-space
 2-space, respectively.

The minimization is performed by the "steepest descent" method for 40 iterations, with a fixed movement of 0.4 along the gradient in each step. No convergence checks are made.

The compiled version of the program occupies about 7K.

An example run is given below:
 RUN OBRAZJC

```
Input filename CUBE
Output file CUBE.F
NONLINEAR MAPPING
The data matrix is
  0       0       0
  0       1       0
  1       1       0
  1       0       0
  0       0       1
  0       1       1
```

1	1	1
1	0	1
Center (C) & scale (S) data (C,S/N) N		
Mean		
.5	.5	.5
Variance		
.25	.25	.25
Mapping error 6.20788E-02		
The 2-dimensional coordinates are		
.464521	.196669	
.330965	1.30363	
1.34127	1.25884	
1.61675	.258168	
.113543	-.301945	
-.159172	.696836	
.994686	.757358	
1.12553	-.349429	

The data from the output file may be used for plotting. The format is compatible with the plotting program AUTOPLOT available on our system.

SVETB

This program was written to perform NLM or SNLM. For the latter, up to 10 basepoints may be selected. The program accepts data from ASCII files or from the keyboard. As for OBRAZJ, the output file is compatible with the plotting program AUTOPLOT. A flowchart of the program is given in the Appendix. The compiled version of the program (SVETC) occupies about 13K.

In its usual version the program has space for 250 points in 10-space. The numbers of points and dimensions may be changed as long as one does not exceed 2500 real numbers. Unfortunately, this cannot be done interactively and the program must be modified as described in the documentation.

The program asks several questions:

Full printout (Y/N)

Normal response is "N". In the "Y" mode, the original data are displayed. It is a good idea to do this when one is not certain about the data being read correctly. In addition, the mapping error and 2-dimensional coordinates are displayed during each iteration.

Input manual(1), from file(2)

The usual situation is "2", from file, which leads to the next question:

Filename

The answer to this question provides some room for

error. When the specified file does not exist, one may try again. This of course does not help during a JOB.

Center (C) & scale (S) data (C,S/N)

This deals with modifications of the input data. The data may be centered by subtracting the mean row (the mean of each column becomes zero). The data may also be scaled by dividing them by the square root of the sum of squares in each column (the vector length of each column becomes 1). Finally, the data may be left alone. This question is not asked when the number of data exceeds 250. In that case the data cannot be modified.

NLM (1), SNLM (2)

One may choose between NLM and SNLM. When the number of points exceeds 40, the program goes automatically to SNLM and this question is not asked. Keep it in mind when preparing job files.

For NLM the parameter input is now completed. For SNLM one still has to settle the input of basepoints.

Are basepoints in a special file (Y/N)

It is usually convenient to have basepoints in a file, in which case the program asks

Filename

The input of the basepoint file name is expected.

Basepoints from data file (1), manually (2)

This question is asked when there is no file of basepoints. Basepoints may be selected from the current data file and sections of the data file are displayed. The basepoints may also be entered manually.

This completes the opening dialogue for SNLM.

An example of a run is given below:

:RUN SVETC

```

FILE STRUCTURE

The program reads ASCII files with numbers separated by space and in fields 7 columns wide. The first line must contain number of samples (3 columns) number of properties (2 columns) and number of fields per line:

```
0200606
 1.16   .70   1.50   4.35   4.29   .29      2
  .98   1.05   1.60   4.04   2.16   .27      3
  1.41   .53   1.30   4.85   3.95   .24      4
  .80   1.01   3.40   6.48   4.13   .65      5
  .....
    1       2       3       4       5
123456789012345678901234567890123456789012
  .....
```

A basepoint file contains in addition to the matrix layout, the line numbers of basepoints in the original data file:

```
004060602051218
  .98   1.05   1.60   4.04   2.16   .27      3
  1.08   .98   1.50   8.17   2.82   .25      6
  1.51   .77   1.60   3.74   2.17   .43     13
  1.64   1.00   1.50   3.16   2.20   .30     19
```

Thus for example 004060602051218 means 4 lines (rows) of data (004), in 6 columns (06) and 6 fields. Since the numbers continue, this is a basepoint file and the basepoints are lines 2 (02), 5 (05), 12, and 18 of the original data file.

For OBRAZJ the format of the JOB file is as follows:

```
!JOB VLADO,USER.CHEMSTRY;TIME=999;INPRI=2
:RUN OBRAZJC
ZFCL          <..... Input file
ZFCLF         <..... Output file
S              <..... Scale the data
!EOJ
```

The structure of a JOB file for SVETC and the number of data points exceeding 250 is:

```
!JOB VLADO,USER.CHEMSTRY;TIME=600;INPRI=6
:RUN SVETC
N            <..... Not full printout
2            <..... Input from file
PKSN         <..... Input file
Y            <..... There is a basepoint file
PKS1B        <..... Basepoint file name
2            <..... Map points from input file
!EOJ
```

APPLICATIONS

A frequent application deals with a table of numbers, with rows referring to samples and columns to parameters. For example, Leegwater and Leegwater (1981) studied volatile compounds in German and French brandies. Fifteen compounds were measured in 8 samples of each (Table 1).

The nonlinear map produced by SVETC (Fig.5) indicates that one can fairly well separate the two groups of brandies.

The second example deals with mass spectrometry. Mass spectra of 22 hydrocarbons of the formula C9.H12 are in the MSSS data base (CIS, Chemical Information Systems, Inc., 7215 York Road, Baltimore, MD 21212, USA) and are given in Table 2.

The nonlinear map (Fig.6) and the expanded view (Fig.7) indicate the separation of aromatic (1-8) and other hydrocarbons. The simplified nonlinear map (Fig.8), using the compounds 1,5,6 as basepoints also separates some of the substituted benzenes (see for example 2,3 and 4,7) and forms at least two groups out of the other hydrocarbons.

In this example, a 71-dimensional space (m/z range 50-120) was mapped. The program had to be modified to accommodate these arrays. The modification is described in the documentation.

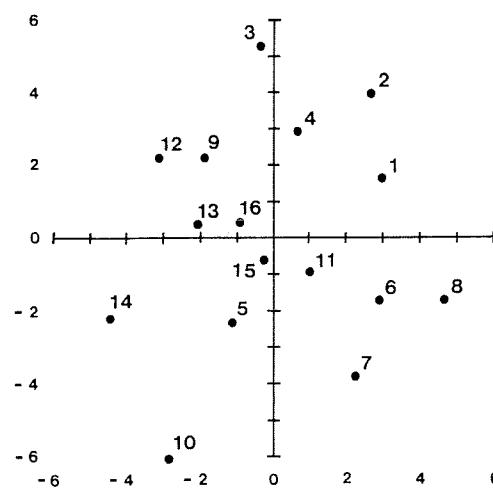

Fig.5. Nonlinear map of flavour components in brandies (Leegwater and Leegwater 1981). The dataset consists of 16 samples (Table 1). The concentrations of 15 components were determined in each sample. German brandies are #1-8; French brandies are #9-16.

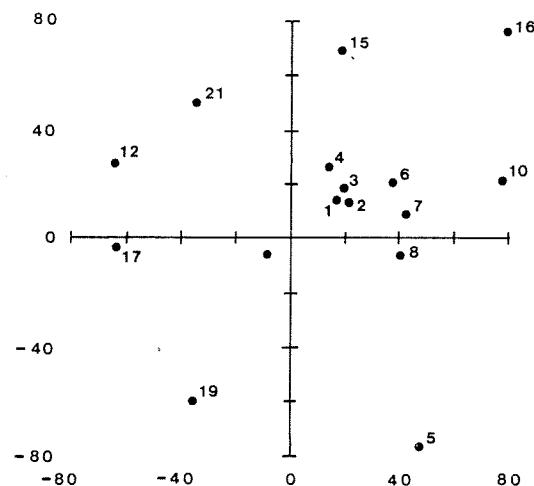

Fig.7. Nonlinear map of mass spectra of hydrocarbons C9.H12.
Numbers refer to compounds in Table 2.
Expanded view.

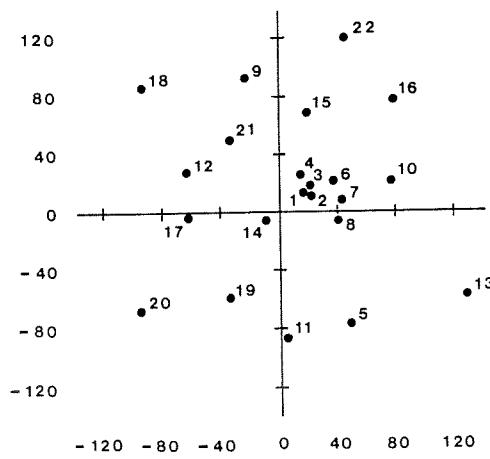

Fig.6. Nonlinear map of mass spectra of hydrocarbons C9.H12.
Numbers refer to compounds in Table 2.

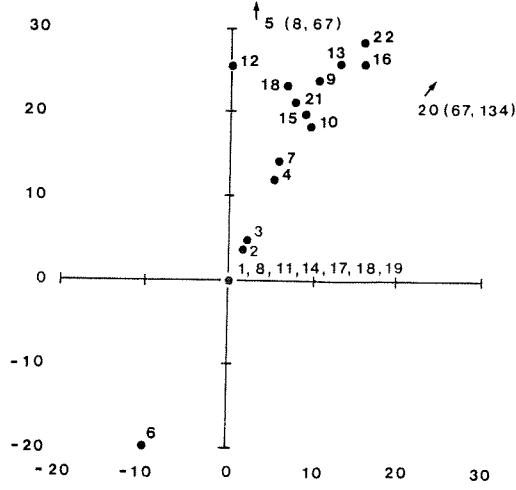

Fig.8. Simplified nonlinear map of mass spectra of hydrocarbons C9.H12.
Base points: 1,5,6.
Numbers refer to hydrocarbons in Table 2.

ACKNOWLEDGMENTS

I thank Dr.A.W. White and Mr.A. Sreedharan for comments. Mr.S. Bellis wrote a program formatting the manuscript. Messrs. W.G. McMullon and F. Cunningham prepared the figures. Mrs.M.M. Irwin and Ms. Marion Haley proofread the manuscript. Ms. Darlene Warren was the technical editor.

10 FILES *,*,*,*,*
20 REM This is a nonlinear mapping (NLM) program.
30 REM It consists of two modules:
40 REM   1. Nonlinear mapping (NLM)
50 REM   2. Simplified nonlinear mapping (SNLM)
60 REM In NLM, points from Nspace (maximum depends on DIM's)
70 REM are projected into 2space, preserving as much as possible
80 REM their original Nspace distances. The program has space for
90 REM 40 points (10-dim) in the NLM mode. Any number of points
100 REM may be handled in the SNLM mode.
110 REM In SNLM, up to 10 "basepoints" are selected in Nspace.
120 REM The basepoints are mapped by NLM. Then, the coordinates
130 REM of any number of points in 2space are calculated,
140 REM maintaining their distances from the basepoints in
150 REM Nspace and in 2space as equal as possible.
155 REM The DIM's are set for general use. If adjustments
156 REM are needed, follow instructions below.
160 DIM B0$[72],B$[72],B1$[6],N$[8],Y1$[1],X$[60],Y$[60],T$[60]
165 DIM X0[2],X2[2],E1[2],E2[2],D[10],Y2[10,2]
166 REM The dimensions of the above are fixed
167 REM In the [M,N] below M*N<=2500
170 DIM X[250,10],X5[250,10]
175 REM The number of rows in these must be as above; columns are set
180 DIM Y[250,2],Y0[250,2],G[250,2]
185 REM These must be at least M*(M-1)/2 for NLM;
186 REM 820 = 40 points
187 DIM X1[820],Y1[820]
188 REM These must be adjusted to the N desired (X3[.,N])
190 DIM P[10],C2[10],V[10],X3[10,10]
195 REM If N>10, disable DO loop 6150-6180!
200 REM Arrays in NLM: -----
210 REM B0$,B$,B1$ reading ASCII files, N$ file name, Y1$ Y/N
220 REM X[] original data matrix, X1[] their distances;
230 REM note that space is provided for only 40 points in NLM!
240 REM C2[] mean row, V[] standard deviation.
250 REM Y[] coordinates in 2space, Y1[] distances in 2space
260 REM Y0[] auxiliary distance in 2space, G[] Jacobian
270 REM Additional arrays are used in SNLM: -----
280 REM Y[] are the 2-dimensional basepoint coordinates,
290 REM Y2[] is auxiliary for same,
300 REM P[] are coordinates of a point, input either manually or
310 REM from a file; D[] contains calculated distances to the
320 REM basepoints;
330 REM as basepoints.
340 REM X0[] 2space coords, X2,X3[] auxiliary,E1[],E2[] derivatives

570 5610  REDIM A3[2,M],A4[M,2]

```

Remark 1

The DIM's are set for general use. If adjustments are needed, follow instructions below:
String dimensions are fixed:
DIM BO\$[72],B\$[72],B1\$[6],N\$[8],Y1\$[1],X\$[60],Y\$[60],T\$[60]
The following arrays are fixed:
DIM X0[2],X2[2],E1[2],E2[2],D[10],Y2[10,2]
In the [M,N] below M*N<=2500:
X[100,15],X5[100,15]
The number of rows in these must be as above; columns are set
Y[100,2],YO[100,2],G[100,2]
These must be at least M*(M-1)/2 for NLM;
820 = 40 points
X1[820],Y1[820]
These must be adjusted to the N desired (X3[.,N])
DIM P[15],C2[15],V[15],X3[10,15]
If N>10, disable DO loop 6150-6180!

Remark 2

The exit from the loop may be by:
1. Decrease of mapping error less than A7 (.0001)
2. No convergence in A2 (20) iterations

Remark 3

The exit from the loop may be by:
1. Decrease of mapping error less than 2*A7

- 2. No convergence in A2 (20 iterations)
- 3. No improvement in mapping error
- 4. Convergence to (0,0) ?

The loop is not entered when the mapped point is a basepoint.
