HOUSING MARKET INFORMATION

HOUSING NOW London CMA

Date Released: Second Quarter 2013

New Home Market

High-density starts see year-over-year growth

Total starts in the first quarter in the London CMA were 17 per cent lower as compared to the first quarter of 2012. This slower start to 2013 was expected, however, demographic factors are supportive of stronger

starts activity for higher-density forms of housing. Townhome and apartment starts were well above the first quarter numbers in 2012. As would be expected, the majority of townhome, apartment, and semi-detached starts were in the City of London. The proportion of higher density home starts in the City was slightly lower than normal as a few semi-detached units and apartments were started in

St. Thomas. Higher-density start activity is supported by the growth of one and two-person households, slowed out-migration to other provinces leading to more 25-44 year-olds being in the housing market, and a steady inflow of 65-80 yearolds from within the province whose living arrangement preferences start to show a slow transition towards higher-density housing. That few highdensity starts occur outside of the City comes as little surprise, especially in St. Thomas where the average new single-detached home sells at a 20 per cent discount to the average new single-detached home in the City of London.

The average price of new homes in the CMA grew by six per cent over the first quarter of 2012. This price growth is largely due to compositional effects. Compositional effects are changes in the average as a result of changes to the proportional number of homes completed at given price points (e.g., proportionally more completions of lower-priced homes pulls down the average price). Compositional effects do not reflect general trends in the housing market. Completions of homes priced in the \$300,000-\$350,000 range grew by nearly a third and accounted for a third of the sales in the first quarter of 2013, double the proportion of a year prior. On its own, this would pull down the average price, however, average prices increased. This indicates that homes in the highest price range (above \$450,000) were sold at prices well above \$450,000. Employment gains through 2012 in higher-wage sectors continue to support these high-end home sales.

Resale Market

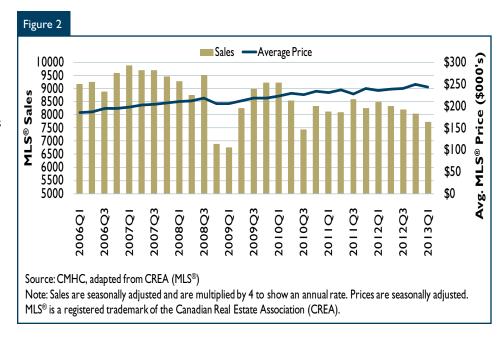

High-end MLS® sales strong

MLS® sales in London through the first quarter of 2013 were 13 per cent lower than in the first quarter of 2012. The trend was similar across Southern Ontario, where sales were lower on a year-over-year comparison in many communities.

The average MLS® price in the CMA grew by three per cent. Price growth is partially a compositional effect, just as in the new home market. MLS® sales of homes priced at greater than \$500,000 grew by nearly a third while in nearly every other price bracket, sales declined. Interestingly, the lowerpriced East London and St. Thomas areas were the strongest performers in the first quarter and higher-priced Middlesex saw a decline in activity through the first quarter. St. Thomas was the only sub-market of the Real Estate Board area to experience year-over-year growth in the first quarter, of which nearly all activity was for single-detached homes. Anecdotal evidence suggests that

some Londoners are looking to the St. Thomas market to take advantage of the 33 percent price discount for the average single detached home as compared to the CMA average. London East also attracted an increased number of buyers with a 33 per cent increase in sales of row homes where average prices were approximately \$123,000. Clearly, even in an affordable marketplace where the high-end of the market drove sales growth, lower-priced homes hold great appeal to many buyers as evidenced by the London East and St. Thomas markets.

On the whole, a market in balance is limiting price growth. The sales-to-new listings ratio in London has remained in balanced territory during the first quarter as it was throughout 2012. Despite fewer MLS® sales through the first quarter, the number of days that homes were on market did not increase, indicating that the resale market environment continued to be healthy and was operating as expected given modest employment growth, a stable interest rate environment, and slightly slower out-migration of 25-44 year olds.

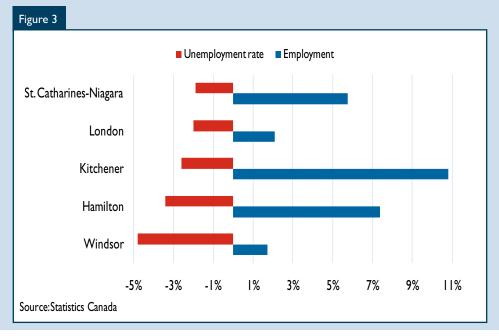

Any Good News Behind The Unemployment Rate?

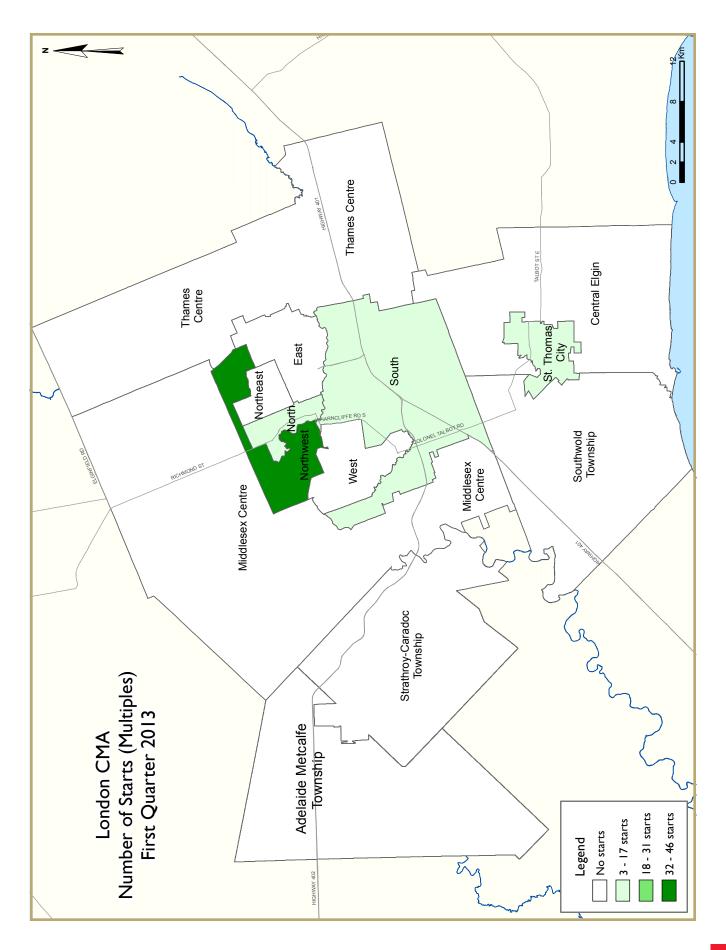

Much is made about the unemployment rate in London and how it compares to other centres in Southern Ontario. Thus, it is pertinent to look at London's unemployment rate in relation to other centres in Southern Ontario. The chart shows percentage point changes in the unemployment rate since its highest point during the recession and per cent gains in employment since the lowest point. It is clear that percentage point improvements of the unemployment rate are not always reflective of employment gains when considering relative rankings as above. For example,

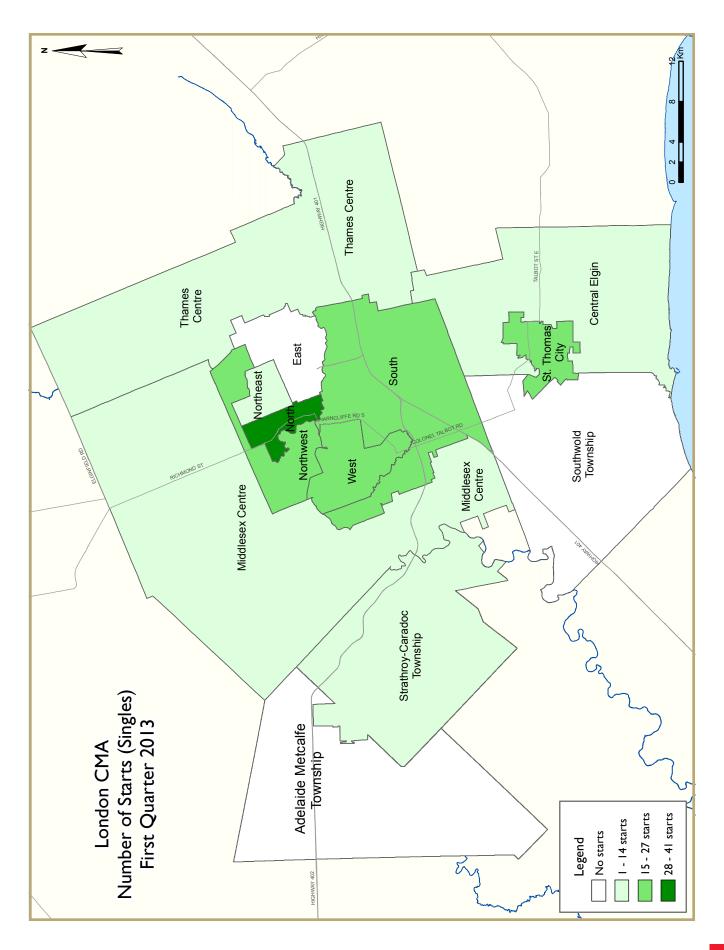

Kitchener had the largest gain in employment although Windsor had the largest percentage point decline of their unemployment rate. How can that be?

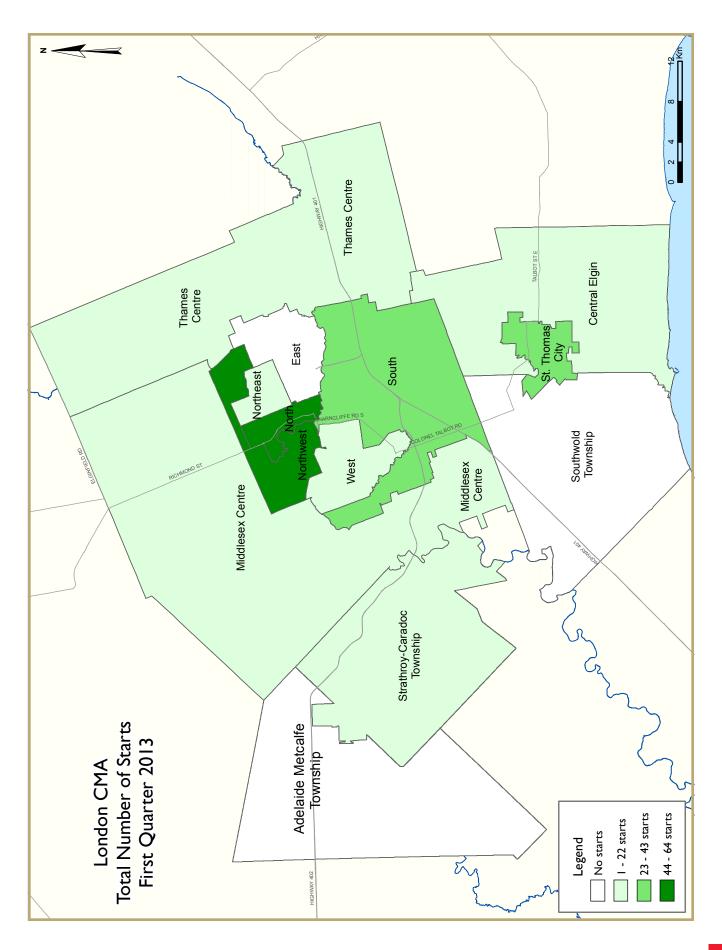

The unemployment rate is the ratio of those unemployed to the sum of those actively seeking employment and employed individuals (the labour force). Therefore, gains in employment must outpace growth of the labour force for the unemployment rate to decrease. For example, it is clear that employment gains in Kitchener-Waterloo coincided with a

growing labour force. While London's unemployment rate is among the highest of this group, exclusively focusing on this rate will not give the full picture of labour market trends. London will continue to see employment growth through 2013, which will be supportive of the housing market, and, also see growth in the labour force which will limit improvements to the unemployment rate. Just looking at the unemployment rate is akin to knowing your car won't start, however, you need to look under the hood to understand why.

METHODOLOGY

Starts & Completions Survey Methodology

The Starts and Completions Survey is conducted by way of site visits which are used to confirm that new units have reached set stages in the construction process. Since most municipalities in the country issue building permits, these are used as an indication of where construction is likely to take place. In areas where there are no permits, reliance has to be placed either on local sources or searching procedures.

The Starts and Completions Survey is carried out monthly in urban areas with population in excess of 50,000, as defined by the 2006 Census. In urban areas with populations of 10,000 to 49,999, all Starts are enumerated in the last month of the quarter (i.e. four times a year, in March, June, September and December). In these centres with quarterly enumeration, Completion activity is modelled based on historical patterns. Monthly Starts and Completions activity in these quarterly locations are statistically estimated at a provincial level for single and multi categories. Centres with populations below 10,000 are enumerated on a sample basis, also in the last month of each quarter (i.e. four times a year, in March, June, September and December).

The Starts and Completions Survey enumerates dwelling units in new structures only, designed for non-transient and year-round occupancy.

Mobile homes are included in the surveys. A mobile home is a type of manufactured house that is completely assembled in a factory and then moved to a foundation before it is occupied.

Trailers or any other movable dwelling (the larger often referred to as a mobile home) with no permanent foundation are excluded from the survey.

Conversions and/or alterations within an existing structure are excluded from the surveys as are seasonal dwellings, such as: summer cottages, hunting and ski cabins, trailers and boat houses; and hostel accommodations, such as: hospitals, nursing homes, penal institutions, convents, monasteries, military and industrial camps, and collective types of accommodation such as: hotels, clubs, and lodging homes.

Market Absorption Survey Methodology

The Market Absorption Survey is carried out in conjunction with the Starts and Completions Survey in urban areas with populations in excess of 50,000. When a structure is recorded as completed, an update is also made as units are sold or rented. The dwellings are then enumerated each month until such time as full absorption occurs.

STARTS AND COMPLETIONS SURVEY AND MARKET ABSORPTION SURVEY DEFINITIONS

A "dwelling unit", for purposes of the Starts and Completions Survey, is defined as a structurally separate set of self-contained living premises with a private entrance from outside the building or from a common hall, lobby, or stairway inside the building. Such an entrance must be one that can be used without passing through another separate dwelling unit.

A "start", for purposes of the Starts and Completions Survey, is defined as the beginning of construction work on a building, usually when the concrete has been poured for the whole of the footing around the structure, or an equivalent stage where a basement will not be part of the structure.

The number of units "under construction" as at the end of the period shown, takes into account certain adjustments which are necessary for various reasons. For example, after a start on a dwelling has commenced construction may cease, or a structure, when completed, may contain more or fewer dwelling units than were reported at start.

A "completion", for purposes of the Starts and Completions Survey, is defined as the stage at which all the proposed construction work on a dwelling unit has been performed, although under some circumstances a dwelling may be counted as completed where up to 10 per cent of the proposed work remains to be done.

The term "absorbed" means that a housing unit is no longer on the market (i.e. has been sold or rented). This usually happens when a binding contract is secured by a non-refundable deposit and has been signed by a qualified purchaser. The purpose of the Market Absorption Survey is to measure the rate at which units are sold or rented after they are completed, as well as collect prices.

DWELLING TYPES:

A "Single-Detached" dwelling (also referred to as "Single") is a building containing only one dwelling unit, which is completely separated on all sides from any other dwelling or structure. Includes link homes, where two units may share a common basement wall but are separated above grade. Also includes cluster-single developments.

A "Semi-Detached (Double)" dwelling (also referred to as "Semi") is one of two dwellings located side-by-side in a building, adjoining no other structure and separated by a common or party wall extending from ground to roof.

A "Row (Townhouse)" dwelling is a one family dwelling unit in a row of three or more attached dwellings separated by a common or party wall extending from ground to roof.

The term "Apartment and other" includes all dwellings other than those described above, including structures commonly known as stacked townhouses, duplexes, triplexes, double duplexes and row duplexes.

INTENDED MARKET:

The "intended market" is the tenure in which the unit is being marketed. This includes the following categories:

Freehold: A residence where the owner owns the dwelling and lot outright.

Condominium (including Strata-Titled): An individual dwelling which is privately owned, but where the building and/or the land are collectively owned by all dwelling unit owners. A condominium is a form of ownership rather than a type of house.

Rental: Dwelling constructed for rental purposes regardless of who finances the structure.

GEOGRAPHICAL TERMS:

A census metropolitan area (CMA) or a census agglomeration (CA) is formed by one or more adjacent municipalities centred on a large urban area (known as the urban core). The census population count of the urban core is at least 10,000 to form a census agglomeration and at least 100,000 to form a census metropolitan area. To be included in the CMA or CA, other adjacent municipalities must have a high degree on integration with the central urban area, as measured by commuting flows derived from census place of work data. CMAs and CAs contain whole municipalities or Census Subdivisions.

A "Rural" area, for the purposes of this publication, is a centre with a population less than 10,000.

All data presented in this publication is based on Statistics Canada's 2006 Census area definitions.

CMHC—HOME TO CANADIANS

Canada Mortgage and Housing Corporation (CMHC) has been Canada's national housing agency for more than 65 years.

Together with other housing stakeholders, we help ensure that the Canadian housing system remains one of the best in the world. We are committed to helping Canadians access a wide choice of quality, environmentally sustainable and affordable housing solutions that will continue to create vibrant and healthy communities and cities across the country.

On June 1, 2012, CMHC's Market Analysis Centre turned 25!

CMHC's Market Analysis Centre has a strong history as the Canadian housing industry's "go-to" resource for the most reliable, impartial and up-to-date housing market data analysis and forecasts, in the country.

CMHC's Market Analysis Centre e-reports provide a wealth of detailed local, provincial, regional and national market information.

- Forecasts and Analysis –
 Future-oriented information about local, regional and national housing trends.
- Statistics and Data Information on current housing market activities – starts, rents, vacancy rates and much more.

Affordable Housing Web Forums

CMHC's Affordable Housing Web Forums are distance-learning seminars that bring interested participants and industry experts together using phone and web technology. You can participate, listen, see and learn without the expense of travelling.
