### I. INTRODUCTION

For purposes of the 1986 Census, there are two industry variables, industry based on the 1980 Standard Industrial Classification (SIC) and industry based on the 1970 SIC.

The standard definition for these variables is:

# Industry

Refers to the general nature of the business carried out in the establishment where the person worked, as indicated by the name of the employer and the kind of business, industry or service. Data are available for persons 15 years of age and over, excluding institutional residents. If not employed in the week prior to enumeration, the information relates to the job of longest duration since January 1, 1985. Persons with two or more jobs were to report the information for the job at which they worked the most hours.

Census industry data based on the 1980 Standard Industrial Classification have three levels of aggregation. There are 18 divisions (labelled A to R) which are subdivided into 75 major groups which are, in turn, subdivided into 296 detailed groups.

Census industry data based on the 1970 Standard Industrial Classification also have three levels of aggregation. There are 12 divisions which are subdivided into 55 major groups which are, in turn, subdivided into 286 detailed classes.

After a review of the industry processing cycle, the structure of this report follows the pattern of an outline of issues not specific to either SIC classification, followed by individual examination of industry based on the 1980 SIC and industry based on the 1970 SIC. The final chapter examines considerations required in historical comparisons of census industry data.

Much of the emphasis in this report will be on potential inconsistencies between census data and other data sources, as well as the identification of problems and solutions that were required in verifying the quality of the responses, coding and processing of the industry variable in the 1986 Census. Despite this critical approach, it should be noted that, in general, the quality of the 1986 industry data compares favourably with other census years and other data sources. Particularly for comparison of data sources for relatively small counts, i.e. less than 20,000 weighted responses, it should be remembered that the census sample of 1 in 5 is significantly larger than that of the other sources which were examined. For example, the Labour Force Survey sample of 1 in 300-400 leads to such weighting and sampling variability for these smaller counts that these results should be treated with caution. As expected, minor processing and data quality problems did arise from the increased coding detail required to obtain data based on the 1980 SIC and the need to use an intermediate coding structure in order to later recreate the two industry variables. The problems and difficulties which occurred as a consequence of this extra detail and more complex processing are offset by the availability of two industry variables (one comparable to historical industry data, the other comparable to more current data sources).

The following actions were taken before release of the 1986 industry data.

For industry based on the 1970 SIC, the data were released with the combination of two classes, 822 - Related health care institutions and 828 - Welfare organizations, into one Class 822/828 - Related health care institutions and welfare services. This combining of classes was required because of the miscoding of a number of nursing homes (with and without personal health care) and old age homes. Further detail is given in Chapter VI, Summary of Issues Specific to Industry Data Based on the 1970 SIC.

For Industry based on the 1980 SIC, the combining of groups was done in three places:

Groups 091 - Service industries incidental to crude petroleum and natural gas and 092 - Service industries incidental to mining were combined into Group 091/092 - Service Industries Incidental to Mineral Extraction. This was required because of miscodes of companies in one of the Regional Office processing coding manuals (i.e. the List of Establishments). The error was particularly noticeable in Alberta.

Groups 401 - Residential building and development and 402 - Non-residential building and development were combined into Group 401/402 - Building, Developing and General Contracting Industries. This action was based on inconsistencies in the Labour Force Survey, 1986 Census and 1981 Census counts, as well as comments from coding consultants and Assistant Regional Processing Managers (ARPMs). The problem stemmed from the difficulty in coding to a level of precision higher than the degree of detail given by respondents.

An attempt to code government services to the full 3-digit group level was found to be unsuccessful. Seventeen 3-digit government codes were collapsed into five groups. This is the same level of coding that is done by the Labour Force Survey and is equivalent to the level of 1981 Census coding.

It should be noted that in these three instances where combining was required, these groups are equivalent to 1981 Census classes. In all cases, the level of detail of the responses given was not sufficient to provide good data.

More detailed information on these changes can be found in Chapter IV, Summary of Issues Specific to Industry Data Based on the 1980 SIC.

In addition to these points, Chapter III, Summary of Non-specific Data Quality Issues discusses some quality problems which did not require action (i.e. special notes or data manipulation) but which will be studied more fully before 1991.

# II. OVERVIEW OF THE INDUSTRY PROCESSING CYCLE

This chapter is designed to give the reader some background on the steps involved in processing the industry variables in the 1986 Census. Besides summarizing some of the required stages, it will also identify several areas that needed analysis in a data quality context.

# A. Regional Office Processing

# 1. Coding Structure

It was in Regional Office processing (ROP) that respondent information given on census questionnaires was translated into industry codes. There are two industry variables by which 1986 Census data are published (i.e. industry based on the 1970 Standard Industrial Classification (SIC) and industry based on the 1980 Standard Industrial Classification). However, in order to avoid double coding of industry responses, it was decided to use an intermediate coding structure and later reassign the coded data to the 1970 SIC or 1980 SIC as applicable. This often involved the creation of new codes which were in neither classification system, but which were added to real codes in both systems when the data were reorganized. This approach had been taken successfully with the occupation variable in 1981 and was repeated again for the occupation variable in 1986. The 1980 SIC was taken as the basis for preparing the intermediate classification but. because of the extreme differences between the 1970 and 1980 SICs, it was also necessary to modify the classification with the insertion of extra classes, in order to provide some continuity and structure. The new classification is usually referred to as the ICM classification, the name being taken from the Industrial Coding Manual (ICM), the principal ROP coding tool. To illustrate the increased level of detail and complexity, the total number of codes increased from 330 to 563 from 1981 to 1986.

# 2. Industrial Coding Manual (ICM)

The ICM was arranged in the same format as a SIC manual, with the classified index followed by a more descriptive analytical section and finally an alphabetical listing of all industry descriptions. Coders were instructed to search for descriptions in the analytical section rather than rely on the alphabetical list, since it contained cautions and instructions on industry coding. However, it was likely that many coders made more extensive use of the detailed alphabetical list than was recommended. In addition to these sections, which were similar to the SIC manuals, there was another section in the ICM which contained item descriptions for "comparison" codes or "dummy" codes. These were codes which did not fit into the structure of the ICM classification, but were required in order to recreate the 1970 and 1980 SICs. Unless specified by a particular ROP instruction, coders were expected to use other sections of the ICM in preference to these comparison codes, and to make use of these codes only when there was a direct or near direct word by word match. The tendency to use or not use these comparison codes was eventually a source of some error, since there was often a regional bias (supported by a particular coding consultant, Assistant Regional Processing Manager or coding supervisor). The overall usage of more codes, including comparison codes, will return as an issue several times in the examination of possible data quality problems, particularly in regard to coding. The second principal coding manual (i.e. the List of Establishments) also

generated data quality problems, although these were often of a different nature and were based on actual coding errors in the List.

# 3. List of Establishments (LOE)

This coding manual was based on exactly the same ICM codes as the Industrial Coding Manual and was created from a larger list of companies in Canada stored on the Business Register Master File. The LOE was the first manual searched by coders and, if an exact address and company name match was found, the code was entered on the questionnaire without using any other manuals. Of the major data files of industry data at Statistics Canada, the census is the only one which so thoroughly combines the two varieties of coding as is represented by the ICM (i.e. coding of individual responses to kind of business) and the LOE (i.e. coding of individual responses to name of company of employment). As will be seen, this mixed methodology leads to difficulty in finding data sources for comparison purposes. For example, the Survey of Employment, Payrolls and Hours (SEPH) is based on a survey of establishments and the information available to SEPH coders includes more complete financial information on sales of products and services of the same type than is available to the business register coders who produce the List of Establishments. On the other hand, Labour Force Survey coders base their coding primarily on descriptions of kind of business. It will be noted throughout the report that the combination of the two sources as used in the census has both advantages and disadvantages. Because the LOE leads to several coding errors that required "fixing" the data, there may be a tendency to emphasize the negative aspects, but the principal benefit (consistency and accuracy of coding) should not be overlooked. If possible, a full evaluation of the use of the LOE as a coding device will be undertaken before 1991 ROP procedures are finalized.

# 4. Consultants and ROP Debriefing

The introduction of coding consultants from Employment and Immigration Canada appeared to be a significant aid in the quality of ROP coding. In particular, the debriefing of the coding consultants and the Assistant Regional Processing Managers in Ottawa at the end of the ROP cycle led to some valuable insights into possible coding difficulties. Again, reference will be made throughout the document to cautions expressed by the consultants, and this additional information was often the extra factor which led to an adjustment of the data (e.g., combining classes to mask data quality problems at the class level). The technical communiqués requesting help in the solution of difficult cases were also a source of information when the quality of data was questioned. These communiqués were sent when coding consultants or Assistant Regional Processing Managers had exhausted all possible measures in attempting to code a response without the aid of Head Office staff, or when there appeared to be inconsistencies or errors in processing instructions or manuals.

# B. Edit and Imputation (E & I)

At the E & I processing stage, industry data that had been transferred to magnetic tapes were processed to give complete "clean" data which were stored on a data base linking all household and person responses. For industry purposes, the process involved three main procedures. They were:

- the actual transfer (loading) of the unedited values from magnetic tapes to a data base;

- the provision of representative industry values to those respondents who should have answered the industry questions but did not;
- the editing of the data in order to avoid conflicting responses from the economic variables.

# 1. Loading the Data Base

As the data were loaded onto an E & I data base, we had our first opportunity to look at aggregate counts for the different codes assigned in ROP processing. In examining the data, several inconsistencies were identified and investigated, and the original questionnaires were searched as required. A problem with Service industries incidental to mining was identified but action was delayed until a later processing stage. There were two errors which required data adjustment at this stage and a summary of the actions taken are given here.

# Code I0102 - House Raising and Moving

Counts for this industry code were found to be surprisingly high and further investigation revealed that many respondents who had been employed in the transportation of household furniture (i.e. respondents said they were "moving houses") had been erroneously classified in I0102, an industry code concerned with the actual movement of a house or cottage from one location to another.

The data were adjusted by changing the industry code to 4562 - Used goods, moving and storage, if the respondent had not given his occupation as one of several construction-related occupations.

# Code I0120 - Co-axial Cable System for Closed Circuit Transmission

Problems with this code stemmed from inaccuracies in the List of Establishments, as well as some miscoding. The specific problems were:

- misentering of digits by the coders of code I0120 instead of the frequently occurring code I1020 Fish products;
- mistaken entries in the LOE for Northern Ontario and Eastern Canada of some telephone companies as I0120 instead of I4820;
- mistakes in the LOE where Telesat Canada was incorrectly coded to I0120 instead of I0118.

These data were readjusted depending upon the occupations of the respondents (e.g., fish canner, lineman) in relationship with the area of the country (e.g., Northern Ontario).

After readjustment, there were no inconsistencies in the data for either problem, although the results would have been slightly different if they had been subject to no coding errors.

### Other

In addition to these miscodes, there were several other instances of a minor nature that were noted. For instance, it was typical to find miscodes of some frequently occurring codes like I1020 in some less common codes with similar digits, e.g., I0120. The I0120 miscodes were changed because, as noted previously, it was necessary to look at all I0120 codes for more substantial coding problems. However, in general, these miscodes were evaluated but no further action was taken because the counts were relatively low.

# 2. Imputation

The second major E & I stage, as it applies to the industry variable, is the imputation (creation) of industry responses for those workers who were identified from other economic questions as having worked, but whose industry response was blank, not codable or "invalid". The imputation procedure (named CANEDIT) assigned respondents to an industry major group by matching with another respondent on the data base with a similar profile and assigning the respondent with a blank or invalid industry code the industry major group of the "donor". Table 1 shows the relative distribution of the major groups with and without these imputed records, as well as a relative distribution of the imputed codes. It can be noted that in no case does the relative distribution after addition of the imputed codes change more than 0.1%. There is slightly more variety in the distribution of the imputed codes themselves (e.g., in MG 92 - Food and Beverage Service Industries, the imputed distribution is 6.3% as against a before imputation distribution of 4.9%) but, on the whole, the results look very reasonable at the aggregate level. Of course, greater disparity would be found if the table was cross-classified by other variables such as age and/or sex.

### 3. Edit

The last major E & I process which affects the industry variable is the editing of the industry, occupation and class of worker variables in order to guarantee internal consistency, e.g., that a person whose occupation is "Elementary or secondary school teacher" has been coded to a teaching or related industry. This is the last stage where adjustments to the data can be made and, in fact, the problems identified in the loading stage were corrected in this edit step.

# C. Retrieval Data Base Creation

After the industry variable has been processed through E & I, the data are in their final form. In the retrieval data base creation step, the two variables that will be made available to the output program are created, IND80 (based on the 1980 SIC) and IND70 (based on the 1970 SIC). These new variables are created by reordering the final E & I industry variable into the appropriate groupings.

# III. SUMMARY OF NON-SPECIFIC DATA QUALITY ISSUES

There are two major areas with data quality problems that were not specific to the use of either of the two classification systems (i.e. 1970 or 1980 SIC), but were found in whatever classification system was selected. Neither of the problems required data adjustment or special notes, but both will be outlined here and could provide the subject for further data quality evaluation during the 1988-1991 period. The two problems were:

- the difficulty in correctly assigning a response to the retail or wholesale sector, when this sector is not specifically stated;
- undercoverage of reporting certain labour market activity in comparison with the Labour Force Survey data.

# A. Differentiation of the Retail/Wholesale Economic Sector

The difficulty in code assignments in the trade sector had been mentioned by both coding consultants and Assistant Regional Processing Managers as a source of possible error. For an incomplete response, in the absence of further information (e.g., local knowledge), or when the company name could not be found in the LOE, it was often a case of making one assignment to retail trade and the next to wholesale trade. This problem would apply equally to the Labour Force Survey data as well, where there is the advantage of the interview but the disadvantage of not making extensive use of the LOE as a coding tool. In any case, it was seen in the evaluation of IND80 that although there was often a poor "fit" between census and survey results for the retail (or wholesale) sale of a product, when the wholesale and retail parts were combined, the results were found to be much better. For example, in MG 55 -Motor Vehicle, Parts and Accessories Industries, Wholesale, the census is 40% (18,000 persons) higher than the LFS, in MG 63 - Automotive Vehicles, Parts and Accessories Industries, Sales and Service, the census is 10% (41,000 persons) lower than the LFS. There are other, less dramatic instances of the same type of reverse difference in LFS - census comparisons. It is difficult to judge if there is a "right" or "wrong" to the results. No special note was issued since, whenever it was possible to check the figures with 1981 LFS and census data, the results were found to be very much the same. This would be an interesting topic for future study, and might yield benefits to both the LFS and the census.

# B. Industry Variable Undercoverage

Note: Industry will be discussed in terms of the 1980 SIC but there are equivalent problems for the data grouped in the 1970 SIC as well.

Overall, when 1986 Census counts have been adjusted to the 1986 Labour Force Survey universe, there is still a shortfall of 2.8% (400,000 workers) when we are dealing with the largest "applicable" universe in census terms, i.e. anyone who had worked since January 1, 1985. Although there may be other methodological factors which contribute to this difference, there is one point which returns again and again, i.e. the better coverage of the marginal worker by the survey. This marginal worker was identified throughout the analysis of the industry variable. A female in Private households (e.g., baby-sitting or cleaning), a male in Direct sellers (e.g., newspaper boy), a female in Direct sellers (e.g., news delivery or door-to-door catalogue sales), a male in Services to buildings and dwellings (e.g., janitor or cleaner).

In all these cases, we are dealing with workers who may alternate periods of employment and unemployment, workers who may not consider what they do to be "working" and, in many of the cases, workers whose information will be reported by another person (e.g., a parent or other household maintainer). These marginal workers tend to be much better reported by the survey interview than the census mail-back. In 1981, the undercount in Private households was noted in the industry certification report. This was found to be true in 1986 as well. In fact, the undercount for females in Private households (182,000) is larger than the total undercoverage of all females (167,000). It is possible that the LFS count is high (e.g., some baby-sitters who work in their own home who should be coded to 979 - Other personal and household services may have been coded to 974), but it is certain that there is a significant undercoverage here from the census point of view. In addition to 974 - Private households, it is evident that there is census undercoverage in 692 - Direct sellers and 995 - Services to buildings and dwellings.

In examining the 1981 Labour Force Survey and 1981 Census data, the same problems can be identified (e.g., newspaper delivery is in 699 - Other retail, and this is higher in the LFS than in the census). Since we are missing perhaps as many as 400,000 marginal workers from our census industry coverage, 1986 data rearranged and displayed on the basis of the 1970 SIC would also be missing these respondents. However, since the 1986 LFS data can only be retrieved in the form of industry based on the 1980 SIC, no direct comparisons of where this undercoverage falls can be made.

The following table illustrates the breakdown for paid workers and the self-employed of some selected industries where it was thought that this undercount of marginal workers was most likely to be present. Other industries where the LFS - census difference was larger in either absolute or relative terms were not included, but it is very possible that there are other cases where there is a strong influence of this marginal worker undercoverage.

As can be calculated from this table, these four categories account for almost 70% of the undercoverage for all workers and almost 60% of the undercoverage for the self-employed.

If time permits, it may be possible to create a profile of these marginal workers that are being missed by the census in order to more efficiently process census data in 1991.

No special note or data adjustment to industry was issued before data release, particularly since the principal component of the undercount (i.e. 974 - Private households) had already been identified in 1981, but also because this problem affects all economic variables.

### IV. SUMMARY OF ISSUES SPECIFIC TO INDUSTRY DATA BASED ON THE 1980 SIC

# A. Data Quality

There were some data quality problems for industry in the form of the 1980 classification caused by the increase in the level of coding detail required for specific portions of the classification. This was particularly evident in Government Service Industries, where the data were combined and released at the major group level, and in Construction Industries, where codes were collapsed into one major group.

In the case of Government Service Industries, there was an expansion to 17 codes at the 3-digit level in the 1980 SIC against five in the 1970 SIC. For Construction Industries, there were 14 1980 SIC 3-digit codes versus four 1970 SIC 3-digit codes.

The third instance where collapsing of codes for data release was required was the Mining Industries, where a problem specific to Service industries incidental to mining was a reflection of an attempt to code to a detailed level, compounded by some miscodes in one of the principal coding tools (i.e. the List of Establishments). There were other problems which were not considered serious enough to require combining groups or issuing cautionary notes. Further detail on these problems can be found in Chapter V, 1980 SIC - Detailed Examination. All data were examined at the group level and, if comparisons of data sources indicated there was the possibility of a quality problem, this investigation was carried further.

The three major data quality problems with the 1980 SIC will be discussed here in some detail.

# 1. Government Service Industries

In 1981, data for this division were collected in five categories, i.e. Defence services, Other federal administration, Provincial administration, Local administration and Other government offices. In the 1980 SIC, there is a much more detailed breakdown at the 3-digit level to which we attempted to code in 1986, e.g., Other federal government was broken down into:

- (a) Protective services:
- (b) Labour, employment and immigration services;
- (c) Foreign affairs and international assistance;
- (d) General administrative services;
- (e) Human resource administration;
- (f) Economic services administration.

There are similar, slightly less detailed, breakdowns for Provincial and territorial and Local governments.

In practice, it was found that for Quebec, in particular, there was a tendency to code to the General administration code at the expense of the more specific

codes. Excluding the territories, Quebec was the province which had the highest proportion of responses coded to General administration for Federal, Provincial and territorial and Local governments. A detailed breakdown of Government Service Industries by Canada, the provinces and territories is shown in Table 2, but a short excerpt of the table is shown here to illustrate the problem. The data shown are for Canada, Quebec and Ontario for Local government service industries.

	CANADA		QUE	QUEBEC		ONTARIO	
	#	%	#	%	#	%	
MG 83 - Local government service industries	299,745	100.0	76,000	100.0	110,975	100.0	
8320 Protect.	64,160	21.4	14,895	19.6	29,025	26.2	
8350 General	143,520	47.9	48,405	63.7	40,555	36.5	
8360 Human res.	62,080	20.7	7,180	9.4	28,980	26.1	
8370 Economic Respondents imputed into	18,275	6.1	2,495	3.3	8,630	7.8	
major group 83	11,715	3.9	3,035	4.0	3,795	3.4	

It can be easily seen that the distributions for Ontario and Quebec are not at all similar and that the Canada level data are somewhere in between the results for the two provinces (a reasonable outcome when dealing with the two largest provinces). Accepting the fact that there are provincial differences in municipal administration, the variations in the data are not acceptable at this level (in particular, note the difference in the general administrative category, 63.7% versus 36.5%).

The local government example was chosen because it shows the largest distortion in comparing the distributions. However, the effect is found to a lesser degree in the provincial and territorial and federal breakdowns.

For the release of industry data, codes were collapsed to the major group level which is equivalent to the level of detail in the 1981 Census and is equal to the level of data collected by the Labour Force Survey since they have converted to the 1980 SIC.

The problem that would have occurred in presenting the data if no collapsing had been done can be seen in the examination of code 8360 - Human resources. The data before collapsing would imply that there were four times as many workers in Ontario as in Quebec providing these services, which is unlikely.

# 2. Major Group 40 in Construction Industries Division

Major Group 40 is Building, Developing and General Contracting Industries. It is composed of two Groups at the 3-digit level, i.e. Group 401 - Residential building and development and Group 402 - Non-residential building and development. Problems were expected in this major group since we had been advised by the Regional Office coding consultants that it was very difficult to differentiate these groups from respondent-provided information (particularly if the company name with its associated SIC code was not found in the List of Establishments). A summary table shows the data at the Canada level, comparing the 1986 Labour Force Survey and the 1986 Census.

	1986 LFS	% dist.	1986 Census	% dist.	% diff. LFS- Census (1986)
401	195,000	83.8	153,710	78.1	-21.3
402	38,000	16.2	42,985	21.9	13.1
Total	233,000	100.0	196,695	100.0	-15.6
MG total including respondents imputed	233,000		204,580		-12.2

More detailed data are available in Table 3, showing 1981 Census recoded data, 1986 Labour Force Survey data and 1986 Census data for Canada.

The undercount of the census in comparison with the Labour Force Survey is an illustration of the better coverage and definition of the "marginal" worker by the Labour Force Survey interview collection method.

The combination of (a) cautions from the coding consultants, (b) undercoverage for the major group as a whole, (c) the disparity in the census-survey differences for the two classes, and (d) the difficulty expected in the assignment of codes for establishments engaged in this industrial activity by business register coders (the source for our List of Establishments code books), all lead to the recommendation of combining these two classes and publishing at the major group level only.

It should be noted that the 1981 recoded data that was used in comparisons based on the 1980 SIC were not at all similar to the 1986 data (i.e. Group 402 was three times as large as Group 401), and although this appeared to be a data quality problem with the 1981 data, it was a final factor in the decision to recommend the collapsing of classes in 1986.

# 3. Services Incidental to Mineral Extraction

This major group contains two groups:

091 - Service industries incidental to crude petroleum and natural gas;

092 - Service industries incidental to mining.

In investigating some significant differences in Canada-level comparisons between the 1981 Census, 1986 Labour Force Survey and 1986 Census, for these groups, it was found that the results were very poor for the province of Alberta, where 60% of the responses for major group 09 were found.

The results are summarized here:

Industry	1981 Census (recode)	1986 LFS	1986 Census	% change 1981-1986 (Census)	% diff. LFS-Census (1986)
Canada				(Остышу)	(1300)
091	30,420	39,000	28,050	-7.8	-28.1
092	12,150	9,000	16,080	32.3	78.7
MG Total (excluding imputed codes for 1986 Census)	42,570	48,000	44,130	3.7	-8.1
Alberta					
091	23,740	29,000	20,305	-14.5	-30.0
092	2,700	<del>-</del>	5,995	122.0	over 2,800% before suppression
MG Total (excluding imputed codes					
for 1986 Census)	26,440	29,000	26,300	-0.5	-9.3

Occupation distributions for these industries were examined and a significant number of occupations related to "drilling" were found for industry Group 092 - Service industries incidental to mining, which would be typical of industry Group 091 - Service industries incidental to crude petroleum and natural gas. A sample of individual questionnaires from Alberta was examined and from the description of the industry given by the respondents (e.g., drilling or related activities), it was found that several Alberta companies had been coded to industry Group 092 instead of to Group 091.

This research took place before the industry variable had been processed through the E & I system and an investigation was made to fix the data in the E & I process. No method of adjusting the data seemed feasible, e.g., the drilling occupations were not specific enough to Group 091 to allow the data adjustment to be made by a global change of all respondents with a specific occupation. It was decided at that time that combining the groups at the major group level seemed appropriate. The coding for Alberta (and to a lesser extent Saskatchewan) was almost certainly wrong and since this represents a large proportion of the data for Canada, the groups were collapsed.

For the industry variable in the form of the 1970 SIC, there is one class which includes both these 1980 SIC groups and, for that reason, this data quality problem was not an issue in this classification.

# B. <u>Level of Detail Available in 1986 Industry Data Based on the 1980 Standard Industrial Classification</u>

Note:

Although some of these points are discussed elsewhere in this document at greater length, they are summarized here for those users whose principal concern is data availability.

Industry from the 1986 Census is available at the 3-digit level based on the 1980 SIC with the following exceptions:

Division A - Agricultural and Related Service Industries

Major Group 09 - Service Industries Incidental to Mineral Extraction

Major Group 40 - Building, Developing and General Contracting Industries

**Division K** - Finance and Insurance Industries

Division N - Government Service Industries (although one 3-digit code, 811 - Defence services, is available)

Explanations for the restriction of these categories to the 2-digit major group level are given in the following discussion.

# Division A - Agricultural and Related Service Industries

There are two major groups in this division. For the first major group in particular, i.e. Agricultural Industries, census respondents do not give sufficient detail in their responses to effectively assign farms to the different categories that would be required to code at the 3-digit level, e.g., livestock farms as opposed to field crop farms.

Major Group 09 - Service Industries Incidental to Mineral Extraction

As noted in Services Incidental to Mineral Extraction under Data Quality in this chapter.

Major Group 40 - Building, Developing and General Contracting Industries

As noted in Major Group 40 in Construction Industries Division under Data Quality in this chapter.

# Division K - Finance and Insurance Industries

This was another instance where the level of detail of information given by census respondents was expected to be insufficient to code to the 3-digit level. This is a very difficult division to code when we do not have access to financial statements or records. As an example, there is one 3-digit SIC code for Deposit accepting mortgage companies (Group 704) and there is another SIC code in a different major group for Mortgage companies (Group 722), commercial mortgage companies are in Group 712 and mortgage brokers are in Group 742. A further example would be the difficulty in differentiating Group 711 - Consumer Loan Companies and Group 712 - Business Financing

Companies. In the absence of a trained enumerator who could elicit further detail, the census responses were expected to be too vague to allow for coding to the 3-digit level in this division.

There were two other factors which contributed to this decision:

- (1) The List of Establishments as prepared by Business Register Division does not cover financial institutions very well and this meant our coders would, for the most part, be operating without the aid of one of our two main coding manuals.
- (2) The level of detail of the 1980 SIC at the 2-digit level (i.e. 5 codes) is the same as the level of detail of the 1970 SIC at the 3-digit level. In other words, coding at the 2-digit level in 1986 was equivalent to coding at the 3-digit level in 1981. To illustrate this point, a table of near-equivalent 1980 and 1970 SIC codes for finance industries follows, with the counts for the experienced labour force shown for each code.

There are several factors to note before examining these data. They are:

- (1) The 1980 SIC data are based on a current (1986) definition of the labour force.
- (2) The 1970 SIC data are based on a 1971-adjusted definition of the labour force.
- (3) Although these categories are nearly equivalent, they are not exactly equivalent. There are some industries that were moved from one category to another in the conversion from the 1970 to the 1980 SIC. Only in Insurance Industries (i.e. 1980 SIC 730, 1970 SIC 721) is this a major change, since this involved the addition of Workman's Compensation Boards and the Unemployment Insurance Commission to these categories in the 1980 SIC whereas, in the 1970 SIC, they were classified in Public Administration.

·	1986 DATA
1980 SIC 700	265,120
1970 SIC 701	265,220
1980 SIC 710	13,860
1970 SIC 703	14,150
1980 SIC 720	25,295
1970 SIC 707	23,265
1980 SIC 730	121,230
1970 SIC 721	113,405
1980 SIC 740	26,855
1970 SIC 705	27,290

Division N - Government Service Industries

As noted in Government Service Industries under Data Quality in this chapter.

### V. 1980 SIC - DETAILED EXAMINATION

In this chapter, the data for each individual division and major group based on the 1980 SIC are separately analysed in comparison to alternative data sources. Often, there is nothing significant to report. In other cases the analysis is taken further to the group level.

# Principal sources are:

- May 1986 Labour Force Survey (in all cases LFS data are rounded to 1,000 and suppressed LT 4,000);
- 1981 Census industry recoded (a recode which was done after the 1981 Census from a selected sample);
- 1986 Census industry data.

The universe for all tabulations was restricted to the Labour Force Survey universe as far as possible and was based on all workers who had worked since January 1 of the previous year (1980 or 1985 as applicable). In 1981, the LFS used the 1970 SIC and for that reason comparisons of 1981-1986 growth for the LFS and the census will be done only occasionally, where conversion from one classification to another did not pose significant problems.

Note: The Labour Force Survey universe differs from the census universe in its exclusion of the Yukon and Northwest Territories, households of Canadians outside Canada (e.g., embassies), full-time members of the Armed Forces and Indian reserves.

### Division A - Agricultural and Related Service Industries

1981 Census	529,725
LFS	599,000
1986 Census	566,435
1981-1986	6.9%
LFS-1986 Census	-5.4%

The census increase for this division is virtually the same as the increase in the total for the selected universe (6.1%). The variance with the LFS (census -5.4%) is understandable in this division where marginal workers would be better identified by the LFS.

# MG 01 - Agricultural Industries

1981 Census	Only available at the division level in the recode
LFS	571,000
1986 Census	542,630
LFS-1986 Census	-5 · 0%

There is nothing significant to note for Major Group 01 in a data quality context. Data were not collected at the group level for this major group, since census respondents do not give enough detail to differentiate the types of farm (e.g., livestock versus field crop).

# MG 02 - Service Industries Incidental to Agriculture

1981 Census Not available

LFS 27,000 1986 Census 23,805

LFS-1986 Census -11.8%

From examination of the data of the equivalent major group as classified under the 1970 SIC, it can be seen that trends for both the LFS and census were increases in the 1981-1986 period, with the LFS gain being larger. Census results appear reasonable.

# Division B - Fishing and Trapping Industries

1981 Census LFS	42,650 56,000
1986 Census	51,950
1981-1986	21.8%
LFS-1986 Census	-7.2%

The 1981-1986 increase of 21.8% is significant, and welcome, since this was noted in the Industry Certification Report in 1981 as being a problem area (particularly in Newfoundland). In 1981, the discrepancy between the LFS and census for the employed labour force was -17%. This census, the difference is -7.2% (for all workers for which industry was applicable). Once again the discrepancy in Newfoundland is high (-30.8), although much less than it was in 1981 (-58.5%).

# MG 03 - Fishing and Trapping Industries

The results for this major group are the same as division results.

It should be noted that in this major group, the Group 031 - Fishing industries shows a disparity of -15.7% in comparing the census and the survey. Again (as with agriculture), there is the continuing census difficulty of covering part-time, part-year, seasonal, minimum-hours workers.

# Division C - Logging and Forestry Industries

1981 Census	108,015
LFS	117,000
1986 Census	121,610
1981-1986	12.6%
LFS-1986 Census	3.9%

There is a specific problem with Major Group 05 - Forestry Services Industry.

# MG 04 - Logging Industry

1981 Census LFS	83,465 92,000
1986 Census	84,205
1981-1986	0.9%
LFS-1986 Census	-8.5%

This major group follows the pattern seen in other primary industries (undercounts as against the LFS).

# MG 05 - Forestry Services Industry

1981 Census	24,555
LFS	24,000
1986 Census	37,405
1981-1986	52.3%
LFS-1986 Census	55.9%

This major group was closely examined because of the discrepancy (census 55.9% higher than LFS) in the LFS-census counts as well as the large growth for 1981-1986. Two factors were noted.

- In observing occupation distributions for this industry major group, it seems likely that some logging operations were reported here rather than in the Logging industry. This is true, in part, to an ambiguous introduction that is found in the ICM (as well as the 1980 SIC), which implies that this major group included all "forestry" activities, whereas it should cover only some marginal activities.
- "Reforestation services" are included here, and the growth in this activity seems strong, particularly in Quebec and British Columbia.

In the end, it was decided that no action was warranted, although rewording of the introduction in the appropriate manuals will be done before these code books are used for another application.

# Division D - Mining (Including Milling), Quarrying and Oil Well Industries

1981 Census	216,175
LFS	221,000
1986 Census	200,690
1981-1986	-7.2%
LFS-1986 Census	-9.2%

Two of the four major groups required closer examination (i.e. MG 06 and MG 09).

# MG 06 - Mining Industries

1981 Census	112,360
LFS	103,000
1986 Census	81,660
1981-1986	-27.3%
LFS-1986 Census	-20.7%

The LFS-census difference here is almost entirely accounted for by the difference in Metal mines (25,000 difference -34.1%). In investigating Metal mines in the more detailed 1970 classification (where Metal mines is a major group not a group), all trends (i.e. LFS, Survey of Employment Payroll and Hours (SEPH) and census) seem to be in the same direction (i.e. gold up, other metal mines down). The figure, despite the discrepancy, is acceptable. This is a case where establishment coding (i.e. from company name lists with associated SIC codes) would yield quite different results from coding from respondents' descriptions of their company's kind of business (since an individual respondent may not be aware of his mining company's main economic activity, particularly when several minerals or products are taken from the same mine). Results are consistent throughout all provinces.

# MG 07 - Crude Petroleum and Natural Gas Industries

1981 Census	51,580
LFS	58,000
1986 Census	61,315
1981-1986	18.9%
LFS-1986 Census	5.7%

All trends, i.e. LFS and SEPH in the 1970 classification and the census in the 1980 classification, show an increase indicating the recovery of this industry from 1983 low points.

# MG 08 - Quarry and Sand Pit Industries

1981 Census	9,670
LFS	12,000
1986 Census	11,980
1981-1986	23.9%
LFS-1986 Census	-0.2%

The results seem reasonable, with a good match.

# MG 09 - Service Industries Incidental to Mineral Extraction

1981 Census	42,570
LFS	48,000
1986 Census	45,735
1981-1986	7.4%
LFS-1986 Census	-4.7%

The major group results were fine but the two individual groups in this major group were a problem source.

In particular, there was an overcount in Group 092 of respondents who should have been coded to Group 091. This was most evident in Alberta where there was a 2,800% difference between the LFS and census results.

Group 091 - Service industries incidental to crude petroleum and natural gas includes many "drilling" type occupations. In examining the occupational distribution for Group 092 - Service industries incidental to mining, many respondents were seen with these "drilling" occupations. As well, an examination of a sample of questionnaires for respondents in Alberta showed that the companies for which they worked had been erroneously classified to 092 rather than 091 in the List of Establishments.

Groups 091 and 092 were collapsed into one Group 091/092. This was not required in the 1970 classification, since there was one code, 099, to which both these industrial activities were classified. The results are discussed more fully in Chapter IV, Summary of Issues Specific to Industry Data Based on the 1980 SIC.

# Division E - Manufacturing Industries

	2,337,725
LFS	2,366,000
1986 Census	2,338,105
1981-1986	0.0%
LFS-1986 Census	-1.2%

There is virtually no difference at the division level.

# MG 10 - Food Industries

1981 Census	266,475
LFS	273,000
1986 Census	277,075
1981-1986 LFS-1986 Census	4.0%

Results are quite consistent at the major group level. At the group level, there was a significant LFS-census difference for Group 107, Bakery products industries. This underlines the difficulty in coding bakeries where goods are sold on the premises (which are coded to retail) as against establishments where the emphasis is baking only. In any case, the census results appear to be reasonable.

# MG 11 - Beverage Industries

1981 Census	44,985
LFS	40,000
1986 Census	40,570
1981-1986	-9.8%
LFS-1986 Census	1.4%

There is no problem at the major group level. There are some differences of up to 20% between the LFS and census at some group levels but nothing significant.

# MG 12 - Tobacco Products Industries

1981 Census	8,760
LFS	10,000
1986 Census	8,255
1981-1986	-5.8%
LFS-1986 Census	-17.4%

There are no differences that cannot be explained by weighting and sampling in the Labour Force Survey (e.g., the total LFS sample is less than 50 persons).

# MG 15 - Rubber Products Industries

1981 Census	28,855
LFS	26,000
1986 Census	26,600
1981-1986	-7.8%
LFS-1986 Census	2.3%

There is no problem at the major group level. At the group level, there are inconsistencies, but the counts are too low for further analysis.

# MG 16 - Plastic Products Industries

1981 Census	44,820
LFS	68,000
1986 Census	54,060
1981-1986	20.6%
LFS-1986 Census	-20.5%

Trends for SEPH, LFS and census, for MG 15 - Rubber Products Industries (down) and MG 16 - Plastic Products Industries (up) are all the same, but the LFS increase is much larger than the census counts.

At the group level for Plastic Products Industries, there is a much smaller residual group (i.e. Group 169, Other plastic products industries) for the census in comparison with the survey and these counts are distributed throughout the other groups.

# MG 17 - Leather and Allied Products Industries

1981 Census	34,290
LFS	36,000
1986 Census	31,010
1981-1986	-9.6%
LFS-1986 Census	-13.9%

Major group results (which are the same as the group in this case) are reasonable.

# MG 18 - Primary Textile Industries

1981 Census	46,320
LFS	26,000
1986 Census	28,535
1981-1986	-38.4%
1991-1990	-30.470
LFS-1986 Census	9.7%

The drop in the Primary Textile Industries is very well demonstrated by all groups in this major group with consistent LFS-census results much lower than 1981 Census results.

# MG 19 - Textile Products Industries

1981 Census	50,715
LFS	45,000
1986 Census	44,280
1981-1986	-12.7%
LFS-1986 Census	-1.6%

Results are consistent with the Primary Textile Industries as well.

# MG 24 - Clothing Industries

1981 Census	151,520
LFS	170,000
1986 Census	159,110
1981-1986	5.0%
LFS-1986 Census	-6.4%

There is no problem at the major group level. This is a case, as is noted also in the 1970 classification, where there was too high a level of detail in the coding (i.e. 14 codes collapsed to make the four groups in Major Group 24). In addition to this, there is the difficulty in differentiating between establishments which make up Group 244, Women's clothing, from those which make up Group 243 - Men's and boy's clothing. Many firms make both. The result of these combined problems is a large group, i.e. Group 249 - Other clothing and apparel industries, which shows an increase of 66.1% over 1981 and is 23.7% higher than the LFS estimate. In any case, the results are consistent in each coding region and province and were not collapsed or regrouped.

# MG 25 - Wood Industries

1981 Census	154,330
LFS	152,000
1986 Census	149,015
1981-1986	-3.4%
LFS-1986 Census	-2.0%

There is no problem at the major group level. The only area that required examination is Group 254 - Sash, door and other millwork industries, where census results are 20% lower than the LFS. No apparent explanation is available.

# MG 26 - Furniture and Fixture Industries

1981 Census	63,365
LFS	68,000
1986 Census	70,515
1981-1986	11.3%
LFS-1986 Census	3.7%

There is no problem at the major group level. In examining the individual groups, the 1986 Census has a much higher residual Group 269, Other furniture and fixture industries, than the LFS (although even this is a decrease from 1981). The difference seems to come completely from Group 261 - Household furniture industries. At the provincial level and the level of coding (i.e. regional) the results were consistently the same across Canada.

# MG 27 - Paper and Allied Products Industries

1981 Census	151,350
LFS	127,000
1986 Census	136,880
1981-1986	-9.6%
LFS-1986 Census	7.8%

There is no evident problem at the major group or group level.

# MG 28 - Printing, Publishing and Allied Industries

1981 Census	158,760
LFS	186,000
1986 Census	177,395
1981-1986	11.7%
LFS-1986 Census	-4.6%

There is no problem at the major group level. Group 283 - Publishing industries, may be slightly off (-22.2% compared to LFS) because of the difficulty in differentiating this group from Group 284 - Combined publishing and printing industries. If the establishment is not in the List of Establishments, it is almost impossible to get this level of detail from the respondent's answer (e.g., a typical response would be "newspaper"). This was noted by coding consultants to be a particularly difficult coding decision.

# MG 29 - Primary Metal Industries

1981 Census	144,585
LFS	137,000
1986 Census	131,410
1981-1986	-9.1%
LFS-1986 Census	-4.1%

There is no problem at the major group level. However, there are two areas that require examination.

Results for Groups 295 - Non-ferrous metal smelting and refining industries and 296 - Aluminum rolling, casting and extruding industry, have been collapsed since 1971, because there is some difficulty in differentiating between the two groups. This does not appear to be required in 1986, with the results consistent with SEPH and LFS ratios of one group to the other (e.g., for the ratio 295 to 296, the 1986 Census is 3.7 to 1, 1986 LFS Census is 2.6 to 1, 1986 SEPH is 3.8 to 1).

There is a significant 1981-1986 decrease in Group 291 -Primary steel industries (-20.6%) and this figure is substantially lower than the LFS figure (-29.3%). The LFS trend is also down from 1981 to 1986. The SEPH 1983-1986 result did not change, while the LFS 1981-1983 result is a 13% decrease (these are 1970 SIC results). The LFS 1984-1986 trend has not changed. The direction of the trend in the early 1980s is clear (a decrease), it is the magnitude of the change that seems to vary.

# MG 30 - Fabricated Metal Products Industries (Except Machinery and Transportation Equipment Industries)

1981 Census LFS	200,560 164,000
1986 Census	181,090
1981-1986	-9.7%
LFS-1986 Census	10.4%

There is no problem at the major group level. At the group level, it is only the smaller groups (LT 20,000) which exhibit large percentage differences.

# MG 31 - Machinery Industries (Except Electrical Machinery)

1981 Census	103,450
LFS	80,000
1986 Census	89,565
1981-1986	-13.4%
LFS-1986 Census	12.0%

The major group continues the trend with the metal industries (i.e. significant declines but LFS figures remain higher than census). In this instance, there are some discrepancies at the group level caused by higher counts by the census in the residual Group 319 - Other machinery and equipment industries.

# MG 32 - Transportation Equipment Industries

1981 Census LFS	221,095 265,000
1986 Census	253,065
1981-1986	14.5%
LFS-1986 Census	-4.5%

There is no problem at the major group level and a good result at the group level. Only the smaller groups show wider divergences. The LFS is higher in the residual group for this major group.

# MG 33 - Electrical and Electronic Products Industries

1981 Census LFS	166,900 195,000
1986 Census	173,480
1981-1986	3.9%
LFS-1986 Census	-11.0%

These results are not as close as could be expected. The major group is not "too bad" but the groups differ noticeably. Part of this problem may be the different coding methodologies, particularly the use of the LOE by the census. Often an establishment dealing in this type of product will cross group boundaries in the type of product manufactured and results can be very different if we compare respondent responses to more complete financial information (which is used by the Business Register Division in their coding and consequently in the List of Establishments).

# MG 35 - Non-Metallic Mineral Products Industries

1981 Census	72,920
LFS	68,000
1986 Census	65,055
1981-1986	-10.8%
LFS-1986 Census	-4.3%

There is no problem at the major group or group level.

# MG 36 - Refined Petroleum and Coal Products Industries

1981 Census LFS	28,000 27,000
1986 Census	26,790
1981-1986	-4.3%
LFS-1986 Census	-0.8%

There is no problem at the major group or group level.

# MG 37 - Chemical and Chemical Products Industries

1981 Census	101,690
LFS	110,000
1986 Census	110,150
1981-1986	8.3%
LFS-1986 Census	0.1%

There is no problem at the major group level. Many of the groups are small so it is difficult to discuss these results in terms of LFS-census comparisons. The only difference here of any significance is the -34.6% disparity between the 1986 Census and the LFS for Group 374 - Pharmaceutical and medicine industry. It should be noted, however, that in 1981, the LFS was also higher than the census, so in that respect the differences are consistent.

# MG 39 - Other Manufacturing Industries

1981 Census	93,985
LFS	95,000
1986 Census	104,190
1981-1986	10.9%
LFS-1986 Census	9.7%

There is no problem at the major group level. There are some inconsistencies at the group level, but this is to be expected when examining some of these residual categories.

# Division F - Construction Industries

1981 Census	797,040
LFS	839,000
1986 Census	804,420
1981-1986	0.9%
LFS-1986 Census	-4.1%

The LFS-census undercount for this division is more (-4.1) than the LFS-census undercount in total (-2.8) and reflects the ability of the survey to better cover marginal workers who may only be working in construction for a short period of time. It should be noted that the 1981-1986 Census trend under the 1970 classification is a negative not a plus as is seen here. In general, there appear to be some problems of undercounting by the census in Major Group 40, and some inconsistencies in Major Group 42.

## MG 40 - Building, Developing and General Contracting Industries

1981 Census LFS	189,435 233,000
1986 Census	204,580
1981-1986	8.0%
LFS-1986 Census	-12.2%

In terms of both number and percentage differences, there are some significant differences in this major group. There are even larger differences at the group level.

	,	LFS	1986 Census	
401	Residential building and development	195,000	153,710	-21.2
402	Non-residential building and development	38,000	42,985	13.1

The undercount for the major group as a whole, which in large part describes the undercount at the division level, can be partially explained by the better enumeration by interviewer methodology of marginal workers (the large proportion of which would be found in this major group for general construction). The difficulty in assigning workers to either of the two categories (i.e. residential versus non-residential) had already been raised as a difficult coding decision by our Regional Office coding consultants. This type of differentiation would also be difficult in the LFS coding methodology.

Provincially, the distribution of "residential" to "non-residential" was consistent in all provinces and coding regions except British Columbia.

In view of the LFS-census inconsistencies and the identified problems at the Regional Office stage, the two groups were collapsed to Major Group 40. These results are discussed more fully in Chapter IV, Summary of Issues Specific to Industry Data Based on the 1980 SIC.

# MG 41 - Industrial and Heavy (Engineering) Construction Industries

1981 Census	132,640
LFS	101,000
1986 Census	105,535
1981-1986	-20.6%
1201-1200	-20.076
LFS-1986 Census	4.3%

The major group and individual groups are reasonably consistent.

#### MG 42 - Trade Contracting Industries

1981 Census	462,250
LFS	495,000
1986 Census	481,715
1981-1986	4.2%
LFS-1986 Census	-2.7%

There is no problem at the major group level. At the group level, the most significant differences are an overcount in the census for Group 422 - Structural and related work in comparison to the LFS (41.4%) and an undercount in Group 427 - Interior and finishing work (-13.5%) and Group 429 - Other trade work (-64.7%).

Collapsing was not recommended for this major group, in particular because the LFS is so much higher in the residual Group 429 - Other trade work (57,000 as against 20,095 for the 1986 Census).

It should be noted that here and throughout the Construction Industries Division, the 1981 recode values suffer from their own data quality problems (e.g., there is a 139,685 count for Group 429 - Other trade work in comparison to 20,095 for the 1986 Census).

#### MG 44 - Service Industries Incidental to Construction

1981 Census	12,720
LFS	10,000
1986 Census	12,790
1981-1986	0.6%
LFS-1986 Census	27.9%

This is a small major group. The larger group in this group matches well in a LFS-census comparison.

## Division G - Transportation and Storage Industries

1981 Census	547,540
LFS	584,000
1986 Census	598,245
1981-1986	9.3%
LFS-1986 Census	2.4%

There is no problem at the division and major group level, but there are some minor discrepancies at the group level.

#### MG 45 - Transportation Industries

1981 Census	516,965
LFS	564,000
1986 Census	572,080
1981-1986 LFS-1986 Census	10.7%

The LFS-census match at the major group level is excellent. At the group level for those groups with more than 20,000, there is an LFS-census undercount by the census of -25.0% for Group 454 - Water transport industries and -14.5% for Group 458 - Other transportation industries, and a distinct overcount, in Group 459 - Other service industries incidental to transportation, of 59.4%. Two of these large discrepancies are in residual categories. No adjustment or collapsing of data was required.

## MG 46 - Pipeline Transport Industries

1981 Census	6,835
LFS	5,000
1986 Census	8,110
1981-1986	18.7%
LFS-1986 Census	62.2%

These counts are too small to be effectively analysed.

## MG 47 - Storage and Warehousing Industries

1981 Census	23,740
LFS	16,000
1986 Census	18,055
1981-1986	-23.9%
LFS-1986 Census	12.8%

These counts are too small to be effectively analysed.

#### Division H - Communication and Other Utility Industries

### MG 48 - Communication Industries

1981 Census	276,295
LFS	305,000
1986 Census	289,380
1981-1986	4.7%
LFS-1986 Census	-5.1%

There is no problem at the major group level and for all large groups.

# MG 49 - Other Utility Industries

1981 Census	135,595
LFS	141,000
1986 Census	142,780
1981-1986	5.3%
LFS-1986 Census	1.3%

There is no problem at the major group level. There are several inconsistencies at the group level, but nothing where adjustments were required. The residual Group 499 - Other utility industries, n.e.c. is higher in the census than the LFS (27.5%).

#### Division I - Wholesale Trade Industries

1981 Census	592,230
LFS	643,000
1986 Census	619,360
1001 1000	4 00/
1981-1986	4.6%
LFS-1986 Census	-3.7%

Coding consultants had expressed some difficulties in assigning respondents to the wholesale or retail sector and this can be noted in comparing the total wholesale and retail sales for a particular product type. The total often gives a better match than the individual retail or wholesale breakdown. A more complete analysis of this trend is found in Chapter III, Summary of Non-specific Data Quality Issues.

It should be noted that Wholesale trade was only a major group in the 1970 classification and raising it to the level of a division has created nine major groups at a lower level.

#### MG 50 - Farm Products Industries, Wholesale

1981 Census	11,165
LFS	16,000
1986 Census	15,895
1981-1986	42.4%
LFS-1986 Census	-0.7%

There is no problem at the major group level, and there is only one group.

## MG 51 - Petroleum Products Industries, Wholesale

1981 Census	33,825
LFS	31,000
1986 Census	28,185
1981-1986	-16.7%
LFS-1986 Census	-9.1%

There is a reasonable match at the major group level and only one group.

# MG 52 - Food, Beverage, Drug and Tobacco Industries, Wholesale

1981 Census	75,990
LFS	110,000
1986 Census	92,375
1981-1986	21.6%
LFS-1986 Census	-16.0%

There is not a good match at the major group or group level between the census and the LFS. In comparing the 1981 Census and the 1981 LFS, the same differences were found (although they were not as large). In all cases the trends were the same for each group. The census was originally higher or lower and the gap between the census and the LFS increased.

The difference is particularly noticeable in Group 521 - Food, wholesale.

LFS	84,000
1986 Census	65,430
% diff.	-22.1%

## MG 53 - Apparel and Dry Goods Industries, Wholesale

1981 Census LFS	18,650 23,000
1986 Census	20,140
1981-1986	8.0%
LFS-1986 Census	-12.4%

There is a reasonable match, with small counts, at the major group and group levels.

## MG 54 - Household Goods Industries, Wholesale

1981 Census	22,840 23,000
1986 Census	21,680
1981-1986	-5.1%
LFS-1986 Census	-5.7%

There is no problem at the major group or group level.

## MG 55 - Motor Vehicle, Parts and Accessories Industries, Wholesale

1981 Census	42,925
LFS	45,000
1986 Census	62,845
1981-1986	46.4%
LFS-1986 Census	39.7%

This is a very bad LFS-census match at the major group and group level. The reverse of this mismatch of results is found in Major Group 63 - Automotive Vehicles, Parts and Accessories Industries, Sales and Service where census counts are proportionally lower than the LFS.

This difference was even more pronounced (on a percentage basis) in 1981 when census counts were 70% higher than the LFS.

It is difficult to isolate a single cause of these discrepancies in LFS and census coding, but I would expect it to be related to companies having been assigned codes in the wholesale sector by Business Register Division coders and these codes being accepted by census coders when no wholesale/retail differentiation was clear.

Due partly to the historical difference in the counts, no adjustment of the data was done.

# MG 56 - Metals, Hardware, Plumbing, Heating and Building Materials Industries, Wholesale

1981 Census	107,465
LFS	108,000
1986 Census	102,725
1981-1986	-4.4%
LFS-1986 Census	-4.9%

There is no problem at the major group level. There are substantial differences at the group level (note the LFS-census difference of -18.6% in Group 563 - Lumber and building materials, wholesale) but these are comparable to 1981.

## MG 57 - Machinery, Equipment and Supplies Industries, Wholesale

1981 Census LFS	172,795 179,000
1986 Census	177,190
1981-1986	2.5%
LFS-1986 Census	-1.0%

There is a good match at the major group level and at the group level with the exception of higher counts for the LFS in the residual Group 579 - Other machinery, equipment and supplies, wholesale.

#### MG 59 - Other Products Industries. Wholesale

1981 Census	106,565
LFS	107,000
1986 Census	98,330
1981-1986	-7.7%
LFS-1986 Census	-8.1%

The major group total matches quite well. There is a wide variance for the individual group responses, but this is to be expected in a residual major group, particularly when many of the groups have small counts.

#### Division J - Retail Trade Industries

1981 Census LFS	1,560,535 1,852,000	
1986 Census	1,759,535	
1981-1986	12.8%	
LFS-1986 Census	-5.0%	

As noted in discussing wholesale trade, coding consultants noted difficulties in differentiating between wholesale and retail trade and there is often more agreement for a total of the wholesale and retail components of a product's sale than the individual wholesale and retail parts. In this division, there is one particular problem that should be noted. There is a undercount by the census in Group 692 - Direct sellers, in which the LFS coverage of marginal workers (e.g., paperboys) is much better than the census.

## MG 60 - Food, Beverage and Drug Industries, Retail

1981 Census	396,890
LFS	477,000
1986 Census	493,060
1981-1986	24.2%
LFS-1986 Census	3.4%

There is an excellent LFS-census match at the major group and group level.

#### MG 61 - Shoe, Apparel, Fabric and Yarn Industries, Retail

1981 Census	147,695
LFS	181,000
1986 Census	174,420
1981-1986	18.1%
LFS-1986 Census	-3.6%

Comparisons are reasonable at the major group level but inconsistent at the group level, particularly Group 614 - Clothing stores, n.e.c., where the census count is down -21.9% from the LFS. This is partially compensated in percentage terms by a 27.7% increase in Group 612 - Men's Clothing Stores.

#### MG 62 - Household Furniture, Appliances and Furnishings Industries, Retail

1981 Census	77,675
LFS	125,000
1986 Census	110,100
1981-1986	41.7%
LFS-1986 Census	-11.9%

The LFS-census comparison at the major group level is not that bad, but there are two group values, Group 622 - Appliance, television, radio and stereo stores and Group 623 - Household furnishings stores in which the census is -25%. These changes are consistent throughout the provinces and coding regions. The 1981 figures are not in a form which is easily comparable, so it is difficult to judge if this difference is historically consistent. A possible explanation is that the List of Establishments coding by the census would tend to code these respondents to a company level if they indicate just a department for their Kind of business, whereas the LFS would tend to code these people to the Kind of business description, even if this was only the department description.

In other words, respondents working in furniture departments of larger establishments would be coded to the larger establishment (e.g., department store) by LOE coding but may be coded only as a furniture store if the coding was done by the Kind of business description.

#### MG 63 - Automotive Vehicles, Parts and Accessories Industries, Sales and Service

1981 Census	343,810
LFS	419,000
1986 Census	377,925
1981-1986	9.9%
LFS-1986 Census	-9.8%

As noted in the discussion for Major Group 55 - Motor Vehicle, Parts and Accessories Industries, Wholesale, there are some significant LFS-census discrepancies here at the group level. This is illustrated in Group 634 - Automotive parts and accessories stores (i.e. census down 28,000) where the difference can be found in the wholesale part of these products. As noted, this is the same type of difference that can be found in 1981 Census-LFS comparisons.

## MG 64 - General Retail Merchandising Industries

1981 Census	329,885
LFS	298,000
1986 Census	303,685
1981-1986	-7.9%
LFS-1986 Census	1.9%

An excellent LFS-census match at the major group level. There is only one group in this major group.

#### MG 65 - Other Retail Store Industries

1981 Census LFS	237,440 281,000
1986 Census	255,140
1981-1986	7.5%
LFS-1986 Census	-9.2%

In this major group we find some of the variety to be expected when examining a residual major group. The significant LFS-census differences in Group 651 - Book and stationery stores (-22.3%) and Group 658 - Toy, hobby, novelty and souvenir stores (-26.8%) are consistent throughout all provinces and coding regions and, in the case of Group 651, are supported by a similar trend in 1981.

As with the difference in Major Group 62, it is probably helpful for the census to be coding, at least in part, with the aid of the LOE, thus avoiding coding respondents to "departments" of larger companies.

#### MG 69 - Non-Store Retail Industries

1981 Census	27,135
LFS	71,000
1986 Census	45,205
1981-1986	66.6%
LFS-1986 Census	-36.3%

As noted, there is a significant undercount by the census in Group 692 - Direct sellers (including paperboys and similar occupations). This is due, in part, to the greater ability to identify marginal workers in an interview than by mail-back questionnaire.

#### Division K - Finance and Insurance Industries

1981 Census	455,535
LFS	491,000
1986 Census	490,740
1981-1986	7.7%
LFS-1986 Census	-0.1%

Coding was only done to the major group level for this industry. The census division totals agree well with LFS figures. At the major group level, there are several LFS-census differences, which serve to point out the difficulty of coding financial institutions and give support to the decision not to code this division to the 3-digit level. It should be noted that there may be some undercounting of Major Group 73 - Insurance Industries, at the expense of Major Group 76 - Insurance and Real Estate Agent Industries (Division L).

# MG 70 - Deposit Accepting Intermediary Industries

1981 Census	270,280
LFS	275,000
1986 Census	287,165
1981-1986	6.2%
LFS-1986 Census	4.4%

There is a quite reasonable agreement for this large major group (mostly banks).

# MG 71 - Consumer and Business Financing Intermediary Industries

1981 Census	17,215
LFS	18,000
1986 Census	15,055
1981-1986	-12.5%
LFS-1986 Census	-16.4%

There is more of a variance than could be hoped for, but it is difficult to further analyse counts less than 20,000.

### MG 72 - Investment Intermediary Industries

1981 Census	30,155
LFS	15,000
1986 Census	28,140
1981-1986	-6.7%
LFS-1986 Census	87.6%

This is a very large difference. The only (partial) explanation is the opposite shift in Major Group 74 - Other Financial Intermediary Industries, a residual category in which the LFS is 6,000 higher than the census. Again, these are difficult entries to code, even at the major group level, and the results were accepted. The 1981 Census-LFS results had an even larger gap.

#### MG 73 - Insurance Industries

1981 Census	114,985
LFS	148,000
1986 Census	131,245
1981-1986	14.1%
LFS-1986 Census	-11.3%

As noted, there may be somewhat of an undercount here in comparison with Major Group 76 - Insurance and Real Estate Agent Industries. This major group (73) contains "insurance companies" in comparison with Group 76, which contains only "independent insurance and real estate agents".

## MG 74 - Other Financial Intermediary Industries

1981 Census	22,895
LFS	35,000
1986 Census	29,130
1981-1986	27.2%
LFS-1986 Census	-16.8%

As mentioned previously, codes in this residual major group may have been used by the LFS coders in preference to codes in Investment Intermediary Industries (MG 72).

## Division L - Real Estate Operator and Insurance Agent Industries

1981 Census LFS	199,645 228,000
1986 Census	244,375
1981-1986	22.4%
LFS-1986 Census	7.2%

Results are reasonable throughout the division, with the exception of a possible overcount in "insurance agents" (MG 76).

## MG 75 - Real Estate Operator Industries (Except Developers)

1981 Census	80,365
LFS	93,000
1986 Census	88,285
1981-1986	9.9%
LFS-1986 Census	-5.1%

The LFS-census match is reasonable (particularly with the imputed codes added into the major group). The difference in Group 751 - Operators of buildings and dwellings is a bit larger than could be hoped.

# MG 76 - Insurance and Real Estate Agent Industries

1981 Census	119,285
LFS	135,000
1986 Census	156,090
1981-1986	30.9%
LFS-1986 Census	15.6%

As noted in discussing Major Group 73, coders have difficulty in coding the general entry "insurance" and it appears that in 1986, there may be an overcount in "insurance and real estate agents" which are the independent operators, at the expense of "insurance companies" which are classed in Major Group 73.

It can be seen that the coding for Major Group 73 and Major Group 76 is consistent throughout Canada, with the exception of Ontario which has 17,000 of the total difference of 22,000 in the 1986 LFS Census results. No collapsing of codes was recommended for the two major groups, in part because the 1981 Census-LFS results were similar.

#### **Division M - Business Service Industries**

1981 Census	511,645
LFS	619,000
1986 Census	637,610
1981-1986	24.6%
LFS-1986 Census	3.0%

There is a good match at the division level, but for the individual groups, responses vary and there is not a good LFS-census match. In general, the groups in this division have exhibited a consistent 25% growth from 1981 to 1986.

#### **Division N - Government Service Industries**

1981 Census	864,265	
LFS	952,000	
1986 Census	944,265	
1981-1986	9.3%	
LFS-1986 Census	-0.8%	

There are reasonable results at the division and major group level. The group results are discussed in Chapter IV, Summary of Issues Specific to Industry Data Based on the 1980 SIC. A table of 3-digit values is shown in Appendix A.

#### MG 81 - Federal Government Service Industries

1981 Census	332,025
LFS	319,000
1986 Census	358,035
1981-1986	7.8%
LFS-1986 Census	12.2%

These counts are deceptive because of the restriction to the LFS universe. Almost all the increase in this division comes from Defence services and those respondents imputed into the major group. This can be seen in the examination of the industry variable based on the 1970 SIC which includes a SEPH comparison.

#### MG 82 - Provincial and Territorial Government Service Industries

1981 Census	280,750
LFS	316,000
1986 Census	301,855
1981-1986	7.5%
LFS-1986 Census	-4.5%

These results are consistent with 1981-1986, LFS-1986 Census and SEPH.

#### MG 83 - Local Government Service Industries

1981 Census	249,355
LFS	314,000
1986 Census	282,585
1981-1986	13.3%
LFS-1986 Census	-10.0%

These are reasonable results at the major group level.

#### MG 84 - International and Other Extra-Territorial Government Service Industries

1981 Census	2,135
LFS	suppressed
1986 Census	1,790
1981-1986	-16.2%
LFS-1986 Census	not
	applicable

These counts are too small to analyse.

#### Division O - Educational Service Industries

These counts are the same as Major Group 85, which follows.

#### MG 85 - Educational Service Industries

1981 Census	810,265
LFS	902,000
1986 Census	898,795
1981-1986	10.9%
LFS-1986 Census	-0.4%

There is a good match at the major group level and in all groups except Group 852 - Post-secondary non-university education which is down -16.2%. There is no apparent reason for the difference.

#### Division P - Health and Social Service Industries

These counts are the same as Major Group 86, which follows.

# MG 86 - Health and Social Service Industries

1981 Census	957,279
LFS	1,120,000
1986 Census	1,119,148
1981-1986	16.9%
LFS-1986 Census	-0.19

There is a good LFS-census match at the division level, but there are some inconsistencies with Group 863 - Non-institutional health services and Group 864 - Non-institutional social services. A problem of a more extreme nature for industry based on the 1970 SIC required collapsing, but it was not required here.

#### Division Q - Accommodation, Food and Beverage Service Industries

1981 Census	768,650
LFS	925,000
1986 Census	924,600
1981-1986	20.3%
LFS-1986 Census	-0.0%

There is a good LFS-census match at the division level, but some inconsistencies at the major group and group level.

### MG 91 - Accommodation Service Industries

1981 Census	233,140
LFS	221,000
1986 Census	244,980
1981-1986	5.1%
LFS-1986 Census	10.9%

In terms of the LFS-census comparison, the major group total does not match that well, but the individual groups are not that unreasonable.

# MG 92 - Food and Beverage Service Industries

1981 Census	535,510
LFS	704,000
1986 Census	679,620
1981-1986	26.9%
LFS-1986 Census	-3.5%

The major group match is reasonable (i.e. with imputed codes added in), but the variation in groups is a little more than expected. Possibly some of the additional counts in Group 911 - Hotels, motels and tourist courts, should have been coded into this major group in Group 921 - Food services or Group 922 - Taverns, bars and night - clubs.

#### Division R - Other Service Industries

1981 Census	698,395
LFS	1,116,000
1986 Census	924,165
1981-1986	32.3%
LFS-1986 Census	-17.2%

There is a significant census undercoverage here (i.e. in Group 974 - Private households) but when this difference (185,000) is accounted for, the results for the rest of the division match quite well.

#### MG 96 - Amusement and Recreational Service Industries

1981 Census	156,870
LFS	218,000
1986 Census	185,885
1981-1986	18.5%
LFS-1986 Census	-14.7%

This is not a good LFS-census match, at the major group or group level. The residual Group 969 - Other amusement and recreational services is markedly different (i.e. census -42.5% compared to the LFS). No additional data manipulation or collapsing was recommended.

#### MG 97 - Personal and Household Service Industries

1981 Census	186,825
LFS	474,000
1986 Census	309,495
1981-1986	65.7%
LFS-1986 Census	-34.7%

There is a census undercoverage problem in Group 974 - Private households (including such activities as baby-sitting and housekeeping) which are better covered by the LFS interviewer-collection process. In addition to this known problem, there are the high census results for the residual Group 979 - Other personal and household services. In other census years, no note had been added to output products to explain the Group 974 undercoverage and this approach was followed this time as well. The differences will be noted in any certification reports, data evaluations, and user guides prepared. A more complete explanation of the coverage difficulties in Groups 974 and 979 is given in Chapter III, Summary of Non-specific Data Quality Issues.

## MG 98 - Membership Organization Industries

1981 Census	98,170
LFS	152,000
1986 Census	157,440
1981-1986	60.4%
LFS-1986 Census	3.6%

The major group total is fine. The individual groups vary considerably (particularly those with smaller counts). For the two groups with the largest counts, Group 981 - Religious organizations (-11.6%) and Group 986 - Civic and fraternal organizations (-8.9%), the variance was not that large.

#### MG 99 - Other Service Industries

1981 Census	256,525
LFS	271,000
1986 Census	271,350
1981-1986	5.8%
LFS-1986 Census	0.1%

There is a perfect match at the major group level, which is surprising for a residual major group. There are two significant disagreements at the group level:

- census down by 34,000 for Group 995 Service to buildings and dwellings;
- census higher by 20,000 for Group 999 Other services, n.e.c.

Although classification changes from 1981 to 1986 do not allow for direct comparisons of the data, examination of equivalent 1970 SIC classes indicate the same type of differences for the 1981 Census and 1981 LFS data.

- 1981 Census was down 13,000 for Class 898 Services to buildings and dwellings.
- 1981 Census was higher by 24,000 for Class 899 Miscellaneous services, n.e.s.

The 1986 difference for Group 995 is another example of the census undercoverage of marginal workers (in this case "cleaners"). Given the similarity of differences in 1981 and 1986, no further data adjustment was taken.

#### VI. SUMMARY OF ISSUES SPECIFIC TO INDUSTRY DATA BASED ON THE 1970 SIC

Use of an intermediate classification which was reordered into a 1970 and 1980 SIC caused some coding problems. This was noted in the Clothing Industries major group (where 14 different intermediate codes were reassigned to six 1970 SIC codes). In this major group, a 125% increase for 1981-1986 in Class 249 - Miscellaneous clothing industries seems to be due in large measure to this problem of too much coding detail. In this case, no action (i.e. collapsing of codes) was taken.

In a second instance, the major group for Health and Welfare Services in Division 10 - Community, Business and Personal Service Industries, further action was required. Coders were given 15 codes arranged on the basis of the 1980 SIC and these 15 codes were later reordered into eight codes in the 1970 SIC. There was a great deal of difficulty in the assignment of codes in this major group (e.g., "nursing homes with personal nursing care" were assigned a different 1970 code than "nursing homes without personal care" and this level of detail is seldom given by the respondent). The overall effect of these difficulties in coding was that different Regional Offices took different approaches to this coding application and, although the Canada-level figures are reasonable, there was no consistency of coding and regional differences were acute. A short table of Quebec and Ontario differences as they compare to Canada totals are shown here to identify the problem for three classes.

		Canada	Quebec	Ontario
821	1981	515,180	158,185	160,925
Hospitals	1986	527,660	159,960	170,355
	% diff.	2.4	1.1	5.9
822		•		
Related	1981	71,270	6,615	33,090
health care	1986	80,015	19,945	19,340
institutions	% diff.	12.3	201.5	- 41.6
828	1981	182,510	52,300	57,555
Welfare	1986	239,035	56,065	93,275
organizations	% diff.	31.0	7.2	62.1

The solution adopted was to combine Class 822 and Class 828 which places the problem codes in one class. This is done in the 1980 SIC by the natural grouping of industries in this classification.

New class numbers after regrouping Class 822 and Class 828

		Canada	Quebec	Ontario
822/828 Related health care institutions and welfare organizations	1981	253,780	58,915	90,645
	1986	319,050	76,010	112,615
	% diff.	25.7	29.0	24.2

In addition to the required collapsing of Classes 822 and 828, which was done for all retrievals, there is a further collapsing of codes required when 1986 data are compared to other census years. A detailed discussion of which codes have to be collapsed, and in which instances, is discussed fully in Chapter VIII, Historical Considerations Regarding Census Industry Data.

There is one final data quality problem which is not readily identifiable in comparison between 1981 and 1986 Census figures but which is isolated and identified in verifying 1986 results in the form of the 1980 SIC. On the basis of the 1980 SIC, there is one group, Group 692 - Direct sellers, which appears to be undercounted by 25,000 by the census. The responses for this group on the basis of the 1970 SIC fall in Class 699 - Retail stores, n.e.s., however, there is no 1986 Labour Force Survey data available to compare to Class 699 (and the 1981-1986 Census increase 154,905 to 179,355, 15.8% appears quite reasonable). The only way in which to identify a shortfall is to compare 1981 Census and 1981 Labour Force Survey results. These differed by almost 40,000 (154,905 to 193,990) and from the results as shown by 1986 Census data on the basis of the 1980 SIC, Class 699 has suffered a similar undercount in this census. The problem is the superior coverage of marginal workers (e.g., newspaper carriers or door-to-door sales) by the enumerator-interview technique as practiced by the survey.

A similar undercount is seen for "baby-sitters" in Class 873 - Private households, and this is also discussed more fully in Chapter III, Summary of Non-specific Data Quality Issues.

As expected, the occupations "newspaper vendor" and "baby-sitter" as found in occupation classifications are also subject to this undercount.

#### VII. 1970 SIC - DETAILED EXAMINATION

In this chapter the data for each individual division and major group based on the 1970 SIC are analysed separately in comparison to alternative data sources. As with the results in Chapter V, analysis was taken to a lower level if anything significant was found.

The principal data sources used to verify the data based on the 1970 SIC were:

- 1981 Census data;
- Survey of Employment, Payroll and Hours (SEPH) data from 1983 to 1986;
- Labour Force Survey data based on the 1970 SIC from 1981 to 1983;
- where comparable, Labour Force Survey data based on the 1980 SIC from 1984-1986.

Being given that the only directly comparable data source to 1986 Census data based on the 1970 SIC was the 1986 SEPH data, the emphasis in analysing the data was based on trends of growth and decline over the 5-year period from both LFS and SEPH as they could be applied to the 1981 Census data. It was thought that because of the extreme differences in coverage and methodology of the SEPH and census data (i.e. SEPH is an "establishment" as against a "household" survey), reliance on analysis of trends for the different industry divisions, major groups and classes would be more realistic. While the historical LFS and SEPH data sources are available, only references to a percentage increase or final 1986 data figure will be given in this document. A 1981-1986 LFS trend is shown occasionally, for industries in which there are few changes in the presentation of the data in the form of the 1970 or 1980 SIC. No attempt was made to adjust the data to cover classification changes, so these numbers are given for convenience of ready analysis only. They should not be considered as "comparable" data.

#### Division 1 - Agriculture

1981 Census	532,250
1986 Census	552,175
1981-1986	4%
1981-1983 LFS	-2%
1981-1986 LFS	1%

This increase is supported by the LFS trend.

# MG 01/02 - Farms

1981 Census	511,465
1986 Census	529,250
1981-1986	3%
1981-1983 LFS	-2%
1981-1986 LFS	0.5%

The 1981-1986 increase is reasonably consistent with the LFS trend.

## NOTE:

Over 30,000 respondents are added to this major group by our final E & I "edits".

## MG 03 - Services Incidental to Agriculture

1981 Census	20,885
1986 Census	22,925
1981-1986	10%
1981-1983 LFS	15%

Again, this increase is reasonably consistent with the LFS trend.

## Division 2 - Forestry

1981 Census	111,475
1986 Census	120,025
1981-1986	8%
1981-1983 LFS	-3%
1981-1986 LFS	-4%
1983-1986 SEPH	-13%

The increase (even more pronounced for females at +20%) is contrary to the LFS trend of a 4% decrease, although the final figure is roughly the same (117,000 in the LFS). Both the LFS and SEPH show the same decreasing trend. This is particularly true for Forestry services in which the census trend is 44% growth (25,800 to 37,242) and the SEPH results are mildly supportive (2% increase for 1983-1986) and the LFS not supportive (-10% for 1984-1986, 8% increase for 1981-1983). From earlier work in the 1980 classification, "Forestry services" was identified as a problem area, and the problem is discussed more fully in the analysis of industry based on the 1980 SIC. No manner of adjusting the data was readily available and a cautionary note was not recommended.

#### MG 01 - Logging

1981 Census	85,670
1986 Census	82,780
1981-1986	-3%
1981-1983 LFS	-6%
1983-1986 SEPH	-18%

There was a similar trend in the LFS.

#### MG 02 - Forestry Services

1981 Census	25,800
1986 Census	37,245
1981-1986	44%
1981-1986 LFS	0%
1981-1983 LFS	8%
1983-1986 SEPH	2%

This is a problem area that could reflect on miscodes that should have been included in "Logging". It is due in part to the ambiguous description in the introduction to this major group in the 1980 SIC which was used in the ICM. The introduction implies a wider coverage for "Forestry services" than is actually the case. The provincial distribution is particularly skewed in Quebec (3,085 to 7,290), an increase of 136% and British Columbia (7,715 to 12,620) an increase of 64%. As previously mentioned, the inclusion of "reforestation services" in this major group would be at least a partial explanation of the 1981-1986 increases in Quebec and British Columbia, since there has been legitimate strong growth in this activity.

## Division 3 - Fishing and Trapping

1981 Census 1986 Census	44,400 51,540	
1981-1986	16%	(64% for females)
1981-1986 LFS	8%	
1981-1983 LFS	1%	

The 64% increase for females is a surprising trend, but the total count was only 7,955 with the East and Quebec showing over 100% increases. It is possible that there was some miscoding of "fish processing plants" in fishing rather than in Class 102, Fish products industry. No SEPH results are available for "Fishing".

In examining the results before edits, there were 1,705 persons in Occ. 8217 - Fishing, canning, curing and packing in the class Fishing. The majority of these should probably have been coded to Class 102 - Fish products industry. A global fix could not be made because there are some legitimate occupations in this unit group (e.g., fish curer) which should go into fishing. In 1981 in these occupations, there was a total of 710 in the labour force which was split nearly equally M - F (i.e. 350 to 365). The problem with miscoding between Fishing and Fish products industries is that establishments cross the class border from one industry to another and it is not always easy to classify respondents' descriptions in one industry. No data adjustment was made in this instance.

## MG 01 - Fishing

1981 Census	38,060
1986 Census	45,385
1981-1986	19%
1981-1983 LFS	6%

As noted in comments for the division, it appears that there may be some problem in coding for Fishing industries in comparison with coding for Fish products industries (Class 102). This may require changes in future coding operations but no data adjustment was taken here.

#### MG 02 - Fishery Services

1981 Census 1986 Census	4,555 4,670
1981-1986	3%
1981-1983 LFS	-12%

Results are too small to analyse further.

# MG 03 - Hunting and Trapping

1981 Census	1,790
1986 Census	1,475
1981-1986	-18%
1981-1983 LFS	-65%

Results are too small to analyse further.

#### Division 4 - Mining (Including Milling), Quarries and Oil Wells

1981 Census	221,945
1986 Census	198,335
1981-1986	-11%
1981-1983 LFS	-7%
1981-1986 LFS	-5%
1983-1986 SEPH	-2%

Although the LFS trend is in the same direction, it was only 5%. The SEPH figures support the census figures since the 1983-1986 trend in SEPH was a decrease against a 1983-1986 minor increase in the LFS. A problem requiring collapsing in the 1980 classification is not relevant here (i.e. both problem industries are in 099).

#### MG 01 - Metal Mines

1981 Census	82,915
1986 Census	51,860
1981-1986	-37%
1981-1983 LFS	-13%
1983-1986 SEPH	-11%

The 1981-1986 drop seemed significant and was examined more closely.

There was a 42% increase in "Gold mines" but all other metal mine classes showed decreases varying from 36% to 48%. The LFS decrease was high (15%) but still significantly lower than the census decrease. The problem is that after 1983, the LFS figures are only available in the 1980 classification which is less detailed for this particular major group, the 1983-1986 decrease in the LFS (-2%) was not as low as SEPH figures which showed an 11% decrease. In all cases, the trends are the same (i.e. gold up, other metals down) but the census figures represent the most pronounced changes.

#### MG 02 - Mineral Fuels

1981 Census	64,650
1986 Census	74,335
1981-1986	15%
1981-1983 LFS	-3%
1983-1986 SEPH	-1%

There is a similar trend in the 1981-1986 LFS (approximately 15%). The recovery in the petroleum industry is supported by LFS, census and SEPH (to a small degree).

## MG 03 - Non-metal Mines (Except Coal Mines)

1981 Census	20,230
1986 Census	15,855
1001 1000	2004
1981-1986	-22%
1981-1983 LFS	-0.3%
1983-1986 SEPH	-14%

From 1981 to 1986, the 22% decrease is caused almost entirely by a 51% decrease in Asbestos.

The 1981-1986 LFS trend was even more pronounced for non-metal mines (22,000 to 12,000), but Asbestos was not differentiated in any figures available after the 1984 change to the 1980 SIC. SEPH figures for the 1983-1986 period indicate a 36% drop for Asbestos.

## MG 04 - Quarries and Sand Pits

1981 Census	9,705
1986 Census	11,585
1981-1986	19%
1981-1983 LFS	-17%
1983-1986 SEPH	-8%

The 1981-1986 LFS follows the same trend but with a larger increase (35%). The final figure is similar (1986 LFS 12,000).

#### MG 05 - Services Incidental to Mining

1981 Census	44,440
1986 Census	44,700
1981-1986	1%
1981-1983 LFS	-2%
1981-1986 LFS	-4%
1983-1986 SEPH	25%

This increase is reasonably consistent with the LFS which shows a 4% decrease.

For industry based on the 1980 SIC, the data will have to be collapsed to this level.

## Division 5 - Manufacturing Industries

1981 Census	2,365,865
1986 Census	2,283,415
1981-1986	-4%
1981-1983 LFS	-8%
1983-1986 SEPH	N/C

The 1981-1986 LFS trend is the same (-5%) but counts are higher in both cases. The LFS decrease is all in the period 1981-1983, while the 1983-1986 SEPH and 1984-1986 LFS register no change.

## MG 01 - Food and Beverage Industries

1981 Census	338,035
1986 Census	330,090
1981-1986	-2%
1981-1983 LFS	1%
1983-1986 SEPH	-6%

The classification composition of this major group has changed a great deal. However, both 1981-1983 LFS and 1984-1986 SEPH are virtually unchanged (both in 1970 SIC), while 1983 to 1984 SEPH shows a 5% decrease. Of the nine classes in this major group there were six with minor losses. The largest gain was 3%. In general, where comparable, the major group changed little from 1981.

#### MG 02 - Tobacco Products Industries

1981 Census	8,760
1986 Census	7,975
1981-1986	-9%
1981-1983 LFS	-32%
1983-1986 SEPH	-13%

The 1981-1986 trend for the LFS is a 9% increase. SEPH is more consistent with census (i.e. showing a decrease in the 1984-1986 time period versus the LFS increase).

#### MG 03 - Rubber and Plastics Products Industries

1981 Census	73,495
1986 Census	80,755
1981-1986	10%
1981-1983 LFS	3%
1981-1986 LFS	40%
1983-1986 SEPH	-1%

The 1981-1986 LFS trend is a much higher (i.e. 40%) increase but the category has changed significantly.

The 1983-1986 SEPH is much more consistent with the 1986 Census than the LFS (e.g., the LFS shows a -32% decrease in rubber; 1984-1986 SEPH was virtually unchanged).

In all cases, the trend is the same with rubber products down and plastic products up.

#### MG 04 - Leather Industries

1981 Census	34,870
1986 Census	29,600
1981-1986	-15%
1981-1983 LFS	-14%
1983-1986 SEPH	-22%

All trends, LFS and SEPH, show a decrease. However, changes in the 1980 classification make the LFS comparability difficult. All four classes in this major group have shown an 1981-1986 decline.

#### MG 05 - Textile Industries

1981 Census	87,135
1986 Census	74,670
1981-1986	-14%
1981-1983 LFS	-27%
1983-1986 SEPH	1%

Cotton, wool, man-made fibre, all show at least a 30% decrease. This is another case where LFS comparisons are difficult. A sharp drop for 1981-1983 (-27%) is followed by consistency for 1984-1986 as against no change for 1983-1986 SEPH. The nine individual classes in this major group are small (i.e. only the residual class is larger than 15,000 in 1986) and only one class has grown significantly in the 1981-1986 time period (i.e. Class 188 - Automobile fabric accessory industry increased by 37%).

## MG 06 - Knitting Mills

1981 Census	23,910
1986 Census	18,285
1981-1986	-24%
1981-1983 LFS	2%
1983-1986 SEPH	-5%

There is no separate Knitting mills code in the 1980 SIC LFS, but SEPH shows a 5% decrease for 1983-1986.

This is one case where the increased coding required to code to both 1970 and 1980 systems may have had some effect on the coding in the 1970 classification. In this case, nine different codes were combined to yield code 239 - Knitting mills (except hosiery mills) as against one code in 1981.

## MG 07 - Clothing Industries

1981 Census	139,155
1986 Census	134,840
1981-1986	-3%
1981-1983 LFS	-1%
1983-1986 SEPH	-1%

Overall, the 1981-1986 decline is minor but the individual classes involved reveal a data quality problem. In particular, Class 249 - Miscellaneous clothing industries shows a 125% increase (11,860 to 26,695). This is probably more a reflection of the level of coding detail (i.e. 14 different codes split among 6 different 1970 SIC codes) than a true change. However, the trends in the other classes in this major group are reasonably well supported by trends in LFS and SEPH.

Since we are dealing with a residual class, no action was recommended. However, the inconsistencies will be noted in planning for future coding operations.

#### MG 08 - Wood Industries

1981 Census	160,505
1986 Census	144,700
1981-1986	-10%
1981-1983 LFS	-16%
1983-1986 SEPH	-11%

The LFS trend is exactly the same. In absolute terms, the decline in Class 251 - Sawmills, planing mills and shingle mills (14,000) is almost enough to account for the total major group decline.

#### MG 09 - Furniture and Fixture Industries

1981 Census	73,515
1986 Census	79,670
1981-1986	8%
1981-1983 LFS	3%
1983-1986 SEPH	15%

The LFS change involves a classification adjustment. The 1981-1983 LFS followed by 1983-1986 SEPH support a similar trend. All four classes grew from 1981 to 1986.

#### MG 10 - Paper and Allied Industries

1981 Census	154,190
1986 Census	138,335
1981-1986	-10%
1981-1983 LFS	-11%
1983-1986 SEPH	3%

The 1981-1986 LFS trend is in the same direction but larger (-20% overall). The SEPH results are more moderate (and in fact indicate an increase for 1984-1986 versus an LFS drop). The results overall appear reasonable.

# MG 11 - Printing, Publishing and Allied Industries

1981 Census	147,165
1986 Census	162,720
1981-1986	11%
1981-1983 LFS	8%
1983-1986 SEPH	4%

The 1981-1986 LFS trend is in the same direction with a larger 24% increase. The SEPH result is more consistent with the more modest census increase.

## MG 12 - Primary Metal Industries

1981 Census 1986 Census	144,145 127,495
1981-1986	-12%
1981-1983 LFS	-15%
1983-1986 SEPH	-4%

The decrease is almost entirely due to the decrease in Class 291 - Iron and steel mills.

The 1981-1986 LFS trend is slightly larger (16% decrease). In previous censuses (i.e. 1971 and 1981) Classes 295 and 296 have been combined because of the difficulty in differentiating the two classes. However, this was not required in 1986. Further detail is given in the discussion of industry based on the 1980 SIC.

# MG 13 - Metal Fabricating Industries (Except Machinery and Transportation Equipment Industries)

1981 Census 1986 Census	199,625 175,560
1981-1986	-12%
1981-1983 LFS	-21%
1983-1986 SEPH	-3%

The 1981-1986 LFS trend shows a 20% decrease and only one of the nine classes in the major group did not decline in the 1981-1986 period.

## MG 14 - Machinery Industries (Except Electrical Machinery)

1981 Census	126,735
1986 Census	113,845
1981-1986	-10%
1981-1983 LFS	-11%
1983-1986 SEPH	-2%

The LFS is not comparable but 1981-1983 decreased by 11% and the 1983-1986 SEPH shows little change.

## MG 15 - Transportation Equipment Industries

1981 Census	216,575
1986 Census	230,135
1981-1986	6%
1981-1983 LFS	-5%
1983-1986 SEPH	15%

The LFS trend is a 19% increase for 1981-1986, while SEPH values fall between census and LFS counts (i.e. 10% increase for 1984-1986 versus 17% LFS).

#### MG 16 - Electrical Products Industries

1981 Census	140,465
1986 Census	137,925
1981-1986	-2%
1981-1983 LFS	-7%
1983-1986 SEPH	9%

The LFS figures are not comparable. However, there is a 7% decrease for 1981-1983 LFS, a SEPH 9% increase for 1983-1986.

#### MG 17 - Non-metallic Mineral Products Industries

1981 Census	73,135
1986 Census	62,770
1981-1986	-14%
1981-1983 LFS	-14%
1983-1986 SEPH	7%

The 1981-1986 data for the LFS is not completely comparable. However, it shows the same general trend (-8%).

## MG 18 - Petroleum and Coal Products Industries

1981 Census	28,030
1986 Census	26,110
1981-1986	-7%
1981-1983 LFS	-13%
1983-1986 SEPH	-5%

The 1981-1986 LFS exhibits the same trend, 10% decrease.

#### MG 19 - Chemical and Chemical Products Industries

1981 Census	105,700
1986 Census	106,585
1981-1986	1%
1981-1983 LFS	-9%
1983-1986 SEPH	6%

Again, although the 1981-1986 LFS is not completely comparable, the general trend is different (i.e. 7% decrease). SEPH shows the same 1983 to 1986 increase as the LFS (approximately 5%-6%).

## MG 20 - Miscellaneous Manufacturing Industries

1981 Census	90,730
1986 Census	101,355
1981-1986	12%
1981-1983 LFS	-2%
1983-1986 SEPH	-14%

The LFS exhibits a 2% decrease for 1981-1983 and a 1% increase for 1984-1986. SEPH showed a 14% decrease for 1983-1986. This inconsistency is not unexpected when dealing with a residual major group.

### **Division 6 - Construction Industry**

1981 Census	805,025
1986 Census	777,385
1981-1986	-3%
1981-1983 LFS	2%
1983-1986 SEPH	11%

The LFS trend is different (i.e. a 2.5% increase) while the SEPH counts for 1983-1986 agree with the LFS. The 1986 LFS is much higher (61,000) than the census.

Analysis of the construction work-force is difficult, but it should be noted the SEPH trend for 1983-1986 special trade contractors is a 16% gain which does not support the census results of a 3% increase from 1981 to 1986. The problem of undercoverage in this division is discussed more fully in Chapter III under Industry Variable Undercoverage.

## **MG 01 - General Contractors**

1981 Census	332,670
1986 Census	302,730
1981-1986	-9%
1981-1983 LFS	-0.5%
1983-1986 SEPH	16%

The LFS data for 1986 on the basis of the 1980 SIC are not useful in detailed analysis of this major group on the basis of the 1970 SIC. However, it is worth noting that for construction overall, the LFS trend is an increase (as against a decrease in census). This is also true for SEPH construction in general, although it should be noted that SEPH figures are annual averages (and it is difficult to compare this type of data in such a seasonal industry).

## MG 02 - Special-trade Contractors

1981 Census	472,360
1986 Census	474,655
1981-1986	0.5%
1981-1983 LFS	4%
1983-1986 SEPH	16%

This small census increase compares to a large increase in SEPH, and an increase for 1981-1983 in the LFS of 4%.

The level of detail of the 1986 coding manuals (i.e. 10 special trade codes in total as against one in 1981 and seven other construction codes compared to three in 1981) introduces a further factor in the comparison of coding schemes. At the aggregate level of the 1970 classification (i.e. four construction codes) there was some lack of agreement between the data sources, but no specific coding problems were evident.

## Division 7 - Transportation, Communication and Other Utilities

1981 Census 1986 Census	992,040 1,013,165
1981-1986	2%
1981-1983 LFS	-1%
1983-1986 SEPH	1%

The LFS shows a nearly identical 1% increase from 1981 to 1986.

## MG 01 - Transportation

1981 Census	568,195
1986 Census	603,425
1981-1986	6%
1981-1983 LFS	-4%
1983-1986 SEPH	2%

It should be noted that declines in water and rail transportation are offset by increases in some of the residual transportation fields (e.g., Highways and bridge maintenance, Miscellaneous services incidental to transport).

The other data sources are not supportive (e.g., 1981-1983 LFS trend down 4% and 1983-1986 SEPH up 2%), although none of the percentage changes are large. In all, only three of the 14 classes in this major group declined while there is a wide variety of gains (from 4% to 38%).

#### MG 02 - Storage

1981 Census	23,775
1986 Census	17,420
1981-1986	-27%
1981-1983 LFS	-8%
1983-1986 SEPH	-11%

The decrease in grain elevators SIC code 524 is substantial: 11,085 to 5,910 (-47%).

#### MG 03 - Communication

1981 Census	263,885
1986 Census	252,895
1981-1986	4%
1981-1983 LFS	6%
1983-1986 SEPH	-1%

The significant difference is a census decrease in Telephone systems from 124,190 to 112,280 (-10%) versus an LFS increase for 1981-1983 (8%) and an 1984-1986 increase in telecommunications carriers (7% increase).

1983-1986 SEPH shows a 4% decrease in Telephone systems.

This is another case where the increased level of coding detail (eight regular codes and nine comparison codes versus four codes in 1981) may have had some effect on the 1970 SIC industry data.

## MG 04 - Electric Power, Gas and Water Utilities

1981 Census	136,180
1986 Census	139,430
1981-1986	2%
1981-1983 LFS	-4%
1983-1986 SEPH	2%

The census trend compares to a 1981-1983 LFS decrease and a 1983-1986 SEPH increase. There was a large growth in the residual class for this major group.

#### Division 8 - Trade

1981 Census	2,141,870
1986 Census	2,262,780
1001 1000	
1981-1986	6%
1981-1983 LFS	4%
1983-1986 SEPH	12%

The 1981-1986 LFS shows a 14% increase, with the final LFS figure 2,496,000. This could be affected by classification changes in this division. It is also different from 1981 figures in which the census was higher than the Labour Force Survey.

In comparisons made in the 1980 SIC for the census and the LFS, it was noted that often the total for a "product" (both retail and wholesale) gave better comparative results than the individual wholesale - retail components.

#### MG 01 - Wholesale Trade

1981 Census	594,725
1986 Census	598,410
1981-1986	1%
1981-1983 LFS	-1%
1983-1986 SEPH	8%

There is nothing obvious in the lower level comparison although, in general, the highs and lows are more pronounced in the LFS.

#### MG 02 - Retail Trade

1981 Census	1,547,145
1986 Census	1,664,370
1981-1986	8%
1981-1983 LFS	6%
1983-1986 SEPH	13%
1984-1986 LFS	6%

In the case of the LFS, the larger increases are affected by their enumerator method of collection, which tends towards capturing responses for some "marginal" types of work - note that in the 1980 classification, for 1986 data, the count is 38,755 in census versus 66,000 in the survey for Group 692 - Direct sellers (i.e. paperboys, etc.).

#### Division 9 - Finance, Insurance and Real Estate

1981 Census	667,880
1986 Census	708,935
1981-1986	6%
1981-1983 LFS	1%
1981-1986 LFS	9%
1983-1986 SEPH	11%

The trends match reasonably well for the division as a whole, but there is a possible problem identified in industry based on the 1980 SIC, of miscoding in Major Groups 02 and 03.

#### MG 01 - Finance Industries

1981 Census	341,380
1986 Census	348,090
1981-1986	2%
1981-1983 LFS	-4%
1983-1986 SEPH	11%

Results seem consistent at this level.

#### MG 02 - Insurance Carriers

1981 Census	108,080
1986 Census	119,160
1981-1986	10%
1981-1983 LFS	-1%
1983-1986 SEPH	1%

The discrepancy between the census and LFS trends for MG 02 reflects the difficulty in coding insurance agents (i.e. Class 721 in MG 02 if they work for a company or Class 735 in MG 03 if they work independently). This problem is addressed more fully in the discussion of industry based on the 1980 SIC.

### MG 03 - Insurance Agencies and Real Estate Industry

1981 Census	218,410
1986 Census	241,680
1981-1986	11%
1981-1983 LFS	11%
1983-1986 SEPH	19%

Note the previous comment for MG 02.

#### Division 10 - Community, Business and Personal Service Industries

1981 Census	3,793,280
1986 Census	4,345,510
1981-1986	15%
1981-1983 LFS	7%
1983-1986 SEPH	11%

As illustrated, the other data sources are very supportive of the large 1981-1986 growth.

#### MG 01 - Education and Related Services

1981 Census	838,965
1986 Census	884,215
1981-1986	5%
1981-1983 LFS	10%
1983-1986 SEPH	7%

In general, for all data sources, the trends are very similar, although the increase is much less for the census.

#### MG 02 - Health and Welfare Services

1981 Census	931,765
1986 Census	1,066,485
1981-1986	15%
1981-1983 LFS	6%
1983-1986 SEPH	9%

Within this major group, there are some troublesome counts in both classifications. For industry data regrouped according to the 1970 SIC, there is a problem with Classes 822 and 828, particularly in Quebec and Ontario.

The decision was taken to combine Classes 822 and 828 which solves the problem for data based on the 1970 SIC. This is partly done in the 1980 classification because of the manner in which industries are grouped in this classification. The problem is discussed more fully in Chapter VI, Summary of Issues Specific to Industry Data Based on the 1970 SIC.

#### MG 03 - Religious Organizations

1981 Census	67,640
1986 Census	73,840
1981-1986	9%
1981-1983 LFS	23%
1983-1986 SEPH	not available

This is a surprising increase in the LFS from 1981-1983. The census results appear more reasonable in this case.

#### MG 04 - Amusement and Recreation Services

1981 Census	160,320
1986 Census	180,955
1981-1986	13%
1981-1983 LFS	7%
1983-1986 SEPH	5%

There are similar trends in the LFS and SEPH. In examining the individual classes with census data, we find a large increase in Class 842 - Motion picture production and distribution (100%). However, a portion of this may be due to miscodes from Class 841 - Motion picture theatres (-20% in 1981-1986). There has no doubt been a significant increase in Class 842, but 100% may be a little higher than the actual value. Partially because the counts are low for these classes, no further action was taken.

#### MG 05 - Services to Business Management

1981 Census	522,945
1986 Census	643,925
1981-1986	23%
1981-1983 LFS	5%
1983-1986 SEPH	14%

The results are well supported by the other main sources. Internally the results for each class are reasonable.

#### MG 06 - Personal Services

210,260
296,895
41%
8%
18%

The 1984-1986 LFS based on the 1980 SIC for Personal and health services varies from 423,000 to 474,000 respondents (12%).

One-third of the census increase is in Class 873 - Private households and another third is in Class 879 - Miscellaneous personal services.

In examining the distributions, we find the same problems as identified in 1981 (i.e. the survey covers marginal industries, such as private households, better than the census). Coverage seems improved from 1981 to 1986. Note, Class 879 includes baby-sitting but an ROP rule assigns "baby-sitters" to Class 873 if the activity is in another person's home. This was a possible source of 1986 miscode, since only Class 879 has a "baby-sitting" entry in the ICM and if the ROP rules were not followed, there would be overreporting of baby-sitters in Class 879. In fact, census results show an increase of over 140% in Class 879 for the 1981-1986 period. Some miscoding is suspected, but the extent is not clear. No data adjustment was made, in part because of the severe undercoverage in Class 873.

#### MG 07 - Accommodation and Food Services

1981 Census	778,870
1986 Census	886,050
1981-1986	14%
1981-1983 LFS	2%
1983-1986 SEPH	21%

The trends are similar. The breakdown within the major group also seems reasonable.

#### MG 08 - Miscellaneous Services

1981 Census 1986 Census	282,515 313,145
1981-1986	11%
1981-1983 LFS	13%
1983-1986 SEPH	8%

There are similar trends for the major group and the individual class trends look reasonable.

### Division 11 - Public Administration and Defence

959,290
1,022,625
<b>7%</b>
4% (not really applicable)
N/A

Because of coverage differences for the LFS and SEPH, there is really no source to provide comparable trend data (particularly at the division level and for Major Group 01 - Federal administration).

#### MG 01 - Federal Administration

1981 Census	410,180
1986 Census	426,860
1981-1986	496

All the growth is in Defence services, while Other federal administration remains virtually unchanged.

From the LFS and SEPH, only the "other" part of federal administration can be verified.

#### Note:

The LFS is similar in both the 1980 and 1970 classifications.

1970 SIC 1981-1983 2.7% 1980 SIC 1984-1986 0.1%

Overall 0.5%

This supports the census counts very well. Occupation results are consistent with the increase in defence, i.e. the ranks increased from

Occ. 6116 (officers) 17,105 to 18,170 Occ. 6117 (enlisted) 58,310 to 65,300 75,415 to 83,470 10.7%

### MG 02 - Provincial Administration

284,700
305,885
7%
4%
0.4%

The trends are similar.

#### MG 03 - Local Administration

1981 Census 1986 Census	262,255 288,085
1981-1986	10%
1981-1983 LFS	7%
1983-1986 SEPH	3%

General trends are in agreement.

#### MG 04 - Other Government Offices

1981 Census	2,165
1986 Census	1,795
1981-1986	-17%
1981-1983 LFS	-12%

Counts are too small to be examined more closely.

### Division 12 - Industry Unspecified or Undefined

1981	Census	493,835
1986	Census	521,875

A 6% increase in the Unspecified and Undefined. This is basically the same as the increase in the universe of persons who worked since January 1 of the previous year (1980 or 1985 as applicable).

1981 Census 13,129,260 1986 Census 13,857,775

An increase of 6%.

### VIII. HISTORICAL CONSIDERATIONS REGARDING CENSUS INDUSTRY DATA

This discussion is not designed to be exhaustive, but rather to answer some of the more frequently occurring questions that are asked by data users, both inside and outside the Bureau. Section B, covering STATPAK code for data retrieval of industry information, will be of interest only to those persons who have access to the census data bases. It is included in this document for the purpose of completeness, since many requests for clarification of industry concepts come from Statistics Canada staff accessing these data bases.

#### A. Availability of Comparable Data

Although industry (or combined industry/occupation) data are available from census publications since the last century, comparable data to that processed by the 1986 Census are available only since 1951. The 1971 publication "Industry Trends, 1951-1971", Cat. No. 94-793, contains data from the 1951 and 1961 Censuses which have been manually converted to the 1970 SIC wherever possible and shown in comparison with 1971 Census data. This conversion of 1951 and 1961 data involved a variety of methods. In its simplest application, complete classes as found in the 1951 and 1961 SICs were added to or subtracted from other complete classes to appropriately reflect changes in the classification structure. When the classification changes were below the level of the class (i.e. the lowest level at which data were collected), other methods such as ratio estimations or adjustments based on industry/occupation combinations were applied. In addition to the tables of detailed industry data for Canada and the provinces, this publication also offers Canada and province data for selected industries cross-classified by a number of other variables such as age, level of schooling, marital status and ethnic origin. An appendix to the publication details the types of data conversions that were done.

It should be emphasized that this publication, or portions of the same tables published in other census industry trend bulletins (e.g., the 1986 publication "Industry Trends, 1951-1986", Cat. No. 93-152, contains an extract of the 1951, 1961 and 1971 data for industry divisions only) are the only sources of comparable data for 1951 and 1961. Unlike 1971, 1981 and 1986, there are no data files or data bases for 1951 and 1961 from which this comparable data can be retrieved. The data contained in the 1951 and 1961 publications for the respective census years were based on the 1951 and 1961 SICs as applicable and cannot be directly compared.

With the availability of bases for 1971, 1981 and 1986 Census data, each of which contains a grouping of industry data in the form of the 1970 Standard Industrial Classification, it is possible to retrieve data that are historically comparable. Due to slight changes made to census processing of the labour force activity variables (e.g., labour force, employment) in 1981 and 1986, industry data for these years are retrieved using a special variable for labour force activity that recreates as much as possible the 1971 definition.

There are several additional points to be considered when comparing census industry data.

(a) With the exception of the 1981 and 1986 Census industry trend bulletins, no print publications from these census years contain historically comparable industry data. Although 1981 data were published using the 1970 SIC, the data for Division 12 (Industry Unspecified or Undefined) were redistributed among industry major groups based on selected socio-economic conditions. This was not done in 1971, or 1986 when industry is regrouped according to the 1970 SIC. In 1986, the 1980 SIC was used in the majority of the printed tables.

- (b) Due to 1971 and 1981 data quality problems with 1970 SIC Classes 295 Smelting and refining and 296 Aluminum rolling, casting and extruding, these classes should be combined when data from these years are tabulated.
- (c) Because of 1971 data quality problems with 1970 SIC Classes 323 Motor vehicle manufacturers and 325 Motor vehicle parts and accessories manufacturers, these classes should be combined when data for 1971 is tabulated.
- (d) Because of 1986 data quality problems with 1970 SIC Classes 822 Related health care institutions and 828 Welfare organizations, these classes are combined on the 1986 data base and cannot be retrieved separately for that census year.
- (e) Because of considerations involved in the creation of the Industry Coding Manual, Classes 051 Placer gold mines and 052 Gold quartz mines are combined on the 1986 data base and cannot be retrieved separately for that census year.
- (f) Individual codes for type of farm (i.e. SIC codes 001-019) should be combined in 1971 and 1981 tabulations to the general entry "Farms" because of data quality problems associated with the more detailed level of coding. The individual codes are not available on the 1986 data base and cannot be retrieved separately for that census year.

#### B. STATPAK Code Required in Retrieval of Historical Data

Since the 1971, 1981 and 1986 Census industry data on the basis of the 1970 SIC are stored in RAPID data base files from which data retrievals can be made, it is possible to create new cross-tabulations with other census variables. The following considerations apply to the code required when retrieving these industry data. They reflect the application of data quality constraints mentioned previously, as well as special requirements that have to be followed for the different census years. This section is intended only for those persons who have direct access to census data bases.

#### 1. 1971 Census

On the 1971 Census data base, the industry variable is stored as a 3-digit numeric, with codes ranging from 000 to 999. Division 12 - Industry Unspecified or Undefined, is coded 000. All respondents who do not have an industry value are coded 998 (e.g., persons in the labour force who have not held a job in the previous 17 months or persons less than 15 years of age).

Besides the regular farm codes 001, 003, 011, 013, 015, 017 and 019 shown in the 1970 version of the SIC, there is a code 005 - Farms, type unknown, which was used extensively in census coding when there was insufficient information to code to a specific farm type. It is recommended that codes 001 to 019 be combined in the general entry "Farms" in any data retrievals, since the quality of the individual code assignments are suspect.

As stated previously, codes 295 and 296 and codes 323 and 325 should be combined because of data quality problems with these codes in 1971. In addition

to these data quality problems, the publication on Industry Trends, 1951-1971 contained corrections to 1971 data due to coding errors in connection with provincial and local government highway maintenance workers. This correction was not made to the 1971 data when published in 1986, since the extent of 1981 and 1986 miscodes was unknown. If this data adjustment for 1971 is required, the adjustment can be made as follows:

- (a) Find the number of respondents in occupation Minor Group 871 -Excavating, paving and related occupations (8710-8719) in industry Class 931 - Provincial administration and industry Class 951 - Local administration.
- (b) Subtract those respondents coded to occupation code 8715, Railway sectionmen and trackmen from the counts in Step 1.
- (c) The two remaining counts from the calculation in step (b) are the numbers that must be subtracted from SIC Classes 931 and 951 respectively to make the data adjustment for the miscodes. These two counts are then added to SIC Class 516 Highway and bridge maintenance to complete the adjustment.

To define the different populations or sub-populations to be used in 1971 Industry tabulations, the following points should be considered:

- (a) Use the universe POPTOTAL.
- (b) Combine the variables LFCODE1 and LFCODE2 as follows:

Employed LFCODE1 2-4 and 9-10 Unemployed LFCODE1 6 and 7

Labour force LFCODE1 2-4 and 6-7 and 9-10 Experienced labour force LFCODE1 2-4 and 6-7 and 9-10

and LFCODE2 4 and 5 and 6

Not in labour force LFCODE1 1 and 5
Population 15 years and over LFCODE1 1-7 and 9-10

- (c) There are two ways to tabulate industry by the class of worker:
  - (i) Class of worker values can be taken directly from the variable WORKTYPE if it is not required to separate the category of self-employed in an incorporated business for addition with employees to form paid workers.

NOTE: The addition of the two categories is often done in census data retrievals or publications, since the self-employed in an incorporated business can be considered as receiving a salary from their own incorporated business (as they are by the System of National Accounts and other Statistics Canada surveys).

(ii) When it is necessary to show separately the self-employed in an incorporated business (or include the counts in a total for paid workers), the variables WORKTYPE and INCORBUS (i.e. incorporation status of business) should be used to define any of the categories required in the following manner:

1 Unpaid family worker **WORKTYPE 1** 2 **Employees** WORKTYPE 5 3 Self-employed incorporated WORKTYPE 4 and INCORBUS 3 (with paid help) 4 Self-employed incorporated WORKTYPE 3 and INCORBUS 3 (without paid help) 5 Self-employed unincorporated WORKTYPE 4 and INCORBUS 1 (with paid help) 6 Self-employed unincorporated WORKTYPE 3 and INCORBUS 1 (without paid help) 7 Paid workers #2 + #3 + #4Self-employed unincorporated 8 #5 + #69 Employers (including incorporated) #3 + #5Own account (including incorporated) #4 + #6

#### 2. 1981 Census

#### (a) General

On the 1981 Census data base, the industry variable is stored as a 5-character coded variable, with the exception of the code for "Not Applicable", which is NOT\_APP. Every other code begins with the letter I, followed by three numbers representing the 1970 SIC and a final character which is either 0 or I.

The second I indicates that this code represents a response that was originally INVALID, BLANK or NOT CODABLE and has now been assigned a code based on comparison of other socio-economic information for this respondent to a "donor" respondent with a valid industry code. This assignment took place in the imputation stage of E & I processing. Whenever 1981 industry data are being compared to other census years, these imputed codes have to be combined to recreate the INVALID, BLANK or NOT CODABLE category as Division 12 - Unspecified or Undefined, since it was only in 1981 that the imputation of data based on 1970 SIC codes was done. In 1971 no imputation was done. In 1986, only data based on the 1980 version of the SIC were imputed.

For 1981 Census data, there are only two aggregations of codes required for data quality reasons. The first is the combination of codes I2950 - Smelting and refining, and I2960 - Aluminum rolling, casting and extruding. The second is the aggregation of all farming codes (i.e. I0010, I0030, I0050, I0110, I0130, I0150, I0170 and I0190) into one general entry "Farms". Of course, when comparing to other census years, it is appropriate to combine 1981 data in those classes which are subject to data quality considerations in the respective census year being compared.

#### (b) For Historically Comparable Retrievals

To define the different populations or subpopulations to be used for historically comparable 1981 Industry tabulations the following points should be considered:

#### (i) To select a universe

-Do NOT use the universe LABFOR, since there are restrictions in this universe based on values of the labour force variable LFTAG and this is not the variable to be used to define historically comparable labour force categories.

-Use the universe EDUCLFR if not in the labour force counts for institutional residents are required.

-Otherwise, use the universe EDUCLF.

(ii) To define the different labour categories, use the 1981 variable LF71 as follows:

Employed LF71 1-5
Unemployed LF71 8-10
Total labour force LF71 1-5 and 8-10
Experienced labour force LF71 1-5 and 8 and 10
Not in the labour force LF71 6 and 7

(including institutional residents)

Population 15 years and over LF71 1-10

(including institutional residents)

(iii) When cross-tabulating by class of worker if, as outlined in the discussion for 1971 data, it is required to include the category of persons self-employed in an incorporated business with paid workers, the variable COWD should be used. If this is not required, the variable COW can be used. The variable COWD is a derived variable that has been created from original class of worker and incorporation status values.

#### (c) Other Data Retrievals

Other than the 1981 industry trend bulletins, 1981 data were published based on a 1981 definition of the labour force and including imputed values at the major group level for responses which were originally INVALID, BLANK or NOT CODABLE.

To define the different populations or subpopulations to be used when comparing to this 1981 published data, the following points should be considered:

#### (i) To select a universe

-If only values for the labour force are required, use the universe LABFOR (which is restricted to the labour force as defined by the variable LFTAG).

-Use the universe EDUCLF if not in the labour force counts are required.

(ii) To define the different labour categories, use the variable LFTAG on the 1981 data base as follows:

Employed LFTAG 1-4
Unemployed LFTAG 5-17
Total labour force LFTAG 1-17
Experienced labour force LFTAG 1-10 and 14-15
Not in the labour force LFTAG 18-21
Population 15 years and over LFTAG 1-21

(Excluding institutional residents)

#### 3. 1986 Census

#### (a) General

On the 1986 Census data, base there are two variables available for retrieval of industry data. The variable to be used for historical comparisons is IND70, which is a coded variable based on the 1970 SIC. There is another variable which is often used for more current comparisons to other surveys. This variable, IND80, is a coded variable based on the 1980 version of the SIC.

### (b) For Historically Comparable Retrievals

As mentioned, IND70 is based on the 1970 SIC. It is stored as a 5-character coded variable, with the exception of the code for "Not Applicable", which is NOT\_APP. Every other code begins with the letter I, followed by three numbers representing the 1970 SIC and a final number 0. Industry Division 12 - Industry Unspecified or Undefined is represented by the single code I0000.

On the 1986 Census data base, those data quality and processing problems that required combining of codes have been done directly on the data base. It is not possible to individually retrieve the components, as it is on the 1971 and 1981 Census data bases.

#### The combined codes are:

- I0010 this represents all farm SICs (codes 001 to 019).
- I0500 this represents the two classes for Gold mines (i.e. Class 051 Placer gold mines and Class 052 Gold quartz mines.
- I8220 this represents two of the classes in Health and welfare services (i.e. Class 822 -Related health care institutions and Class 828 -Welfare organizations).

To define the different populations or subpopulations to be used for historically comparable 1986 industry tabulations, the following points (which are very similar to the ones discussed for 1981 retrievals with the exception that the actual code numbers are different) should be considered:

#### (i) To select a universe

- Do NOT use the universe LABFOR, since there are restrictions in this universe based on values of the labour force variable LFTAG and this is not the variable to be used to define historically comparable labour force categories.
- Use the universe EDUCLFR if not in the labour force counts for institutional residents are required.
- Otherwise, use the universe EDUCLF.
- (ii) To define the different labour categories, use the 1986 variable LF71 as follows:

Employed LF71 1-5 Unemployed LF71 9-11

Total labour force LF71 1-5 and 9-11 Experienced labour force LF71 1-5 and 9 and 11

Not in the labour force LF71 7 and 8

(including institutional residents)

Population 15 years and over LF71 1-5 and 7-11

(including institutional residents)

(iii) When cross-tabulating by class of worker if, as outlined in the discussion for 1971 data, it is required to include the category of persons self-employed in an incorporated business with paid workers, the variable COWD should be used. If this is not required, the variable COW can be used. The variable COWD is a derived variable that has been created from original class of worker and incorporation status values.

#### (c) Other Data Retrievals

Other than the 1986 industry trend bulletins, 1986 data were published based on the 1980 SIC (using the variable IND80) with a 1986 definition of the labour force and including imputed values at the major group level for responses which were originally INVALID, BLANK or NOT CODABLE. The variable IND80 is a 5-character coded variable, with the exception of the code for "Not Applicable" which is NOT\_APP. Every other code begins with the letter I, followed by three numbers representing the 1980 SIC and a final character which is either 0 or I.

As with the 1981 variable INDUSTRY, the second I represents a response that was originally INVALID, BLANK or NOT CODABLE and has now been assigned a code based on comparison of other socio-economic information for this respondent to a "donor" respondent with a valid industry code. As previously mentioned, this assignment takes place in the imputation stage of E & I.

Further information on which 1980 SIC codes are available is given in the second section of Chapter IV (Level of Detail Available in 1986 Industry Data Based on the 1980 Standard Industrial Classification).

To define the different populations or subpopulations to be used for the 1980 SIC, the following points should be considered:

- (i) To select a universe:
  - If only values for the labour force are required use the universe LABFOR (which is restricted to the labour force as defined by the variable LFTAG).
  - Use the universe EDUCLF if not in the labour force counts are required.
- (ii) To define the different labour categories, use the variable LFTAG on the 1986 data base as follows:

Employed LFTAG 1-4
Unemployed LFTAG 5-17
Total labour force LFTAG 1-17

Experienced labour force LFTAG 1-10 and 14-15

Not in the labour force LFTAG 18-21

Not in the labour force LFTAG 18-21 Population 15 years and over LFTAG 1-21

(excluding institutional residents)

TABLE 3 COMPARISON OF 1980 SIC COUNTS FOR THE 1981 AND 1986
CENSUS AND MAY 1986 LF SURVEY. THE 1981 CENSUS DATA IS BASED ON
A RECODED SAMPLE OF 1981 RESPONSES. ALL RETRIEVALS ARE BASED ON
THE LFS UNIVERSE, FOR PERSONS WHO WORKED SINCE JAN. 1ST OF THE
PREVIOUS YEAR (1980 OR 1985 AS APPLICABLE). CENSUS MAJOR GROUP
TOTALS FOR 1986 CONTAIN DATA THAT WAS IMPUTED TO THE RESPECTIVE
MAJOR GROUPS. FOR 1981 DATA, THESE IMPUTED COUNTS SHOW IN THE
TOTAL FOR ALL INDUSTRIES ONLY

NOTE : LFS FIGURES ROUNDED TO 1,000 AND SUPPRESSED LT 4,000

# APPENDIX D OTHER INDUSTRY DATA PRODUCTS

. 

#### OTHER INDUSTRY DATA PRODUCTS

There are several other products from the 1986 Census which contain industry data. These include:

#### **NATION SERIES**

 Mobility Status and Interprovincial Migration (Catalogue No. 93-108)

This publication presents data on the mobility status of Canadian residents. The focus is on the demographic, educational and employment characteristics of interprovincial migrants 15 years and over. The components (in, out and net) of interprovincial migration are also shown. Included are counts of the labour force 15 years and over by industry divisions, for Canada, the provinces and the territories.

- Industry (Catalogue No. 93-113)

Industry data for members of the labour force 15 years and over by age, sex and selected labour characteristics are presented for Canada, the provinces and the territories. Data are based on the 1980 Standard Industrial Classification.

#### **DIMENSION SERIES**

Industry Trends, 1951-1986 (Catalogue No. 93-152)

This publication provides data on industry trends from 1951-1986 for the labour force 15 years and over by sex, for Canada, the provinces and the territories. All tables are based on the 1970 version of the Standard Industrial Classification (SIC). For purposes of comparability, the data processed for the 1951 and 1961 Censuses have been manually adjusted to the 1970 SIC by the use of conversion charts created by comparing classification manuals used in these census years. Data for 1971, 1981 and 1986 are processed based on the 1970 SIC and no postcensus data adjustments were required.

- Census Metropolitan Areas (Catalogue No. 93-156)

This publication provides data covering a wide range of census variables for the 25 census metropolitan areas (large urban centres) in Canada. Included are counts of the labour force 15 years and over for 60 selected industries. Data are provided from both the 1981 and 1986 Censuses, including percentage change from 1981–1986. Data are based on the 1970 Standard Industrial Classification.

#### **PROFILE SERIES**

This series includes industry data, as well as information on a wide range of other census variables. Data are presented for a variety of subprovincial areas: Census Divisions and Subdivisions (94-101 to 94-124), Federal Electoral Districts (94-125, 94-126, 94-133 and 94-134), Census Metropolitan Areas and Census Agglomerations (94-127 and 94-128), Censustracted Centres (Census Tracts and Component Subdivisions) (95-101 to 95-174), Urban and Rural Areas (94-129 and 94-130) and Labour Force Survey Economic Regions (94-131). Data for profiles are also available in machine-readable form.

#### **FOCUS ON CANADA SERIES**

Trends in Occupation and Industry (Catalogue No. 98-135)

This study presents an industry-occupation employment structure as revealed by the 1986 Census and includes trend analysis between 1971 and 1986. The study also examines changes in the distribution of the experienced labour force among occupations and industries between 1971 and 1986.

#### **BASIC SUMMARY TABLES**

This series is designed to meet the needs of users who wish to study the characteristics of small areas. Tables provide information on a variety of census variables. The following industry tables are available:

LF86B05 Labour force 15 years and over by industry divisions (21) (based on the 1980 classification - "Unspecified or undefined" distributed among industry divisions) and sex (3)

LF86B09 Labour force 15 years and over by industry divisions (15) (based on the 1970 classification - "Unspecified or undefined" shown as a separate division) and sex (3)

The tables are produced for the following four geographic levels: (i) enumeration areas and federal electoral districts; (ii) census subdivisions (municipalities) and census divisions (counties); (iii) census tracts and provincial census tracts; (iv) Canada, provinces, territories and census metropolitan areas.

Data for the basic summary tables are available in machine-readable form to facilitate aggregation and manipulation.

#### REFERENCE PRODUCTS

Users, who may require assistance in understanding and interpreting the data and geographic concepts appearing in this set of tabulations, should refer to the 1986 Census Dictionary (Catalogue No. 99-101E or F). The Dictionary provides a range of definitions for all variables and terms used in 1986 Census data products.

Further details on the products and services available from the census are provided in the 1986 Census Products and Services - Final Edition (Catalogue No. 99-103E or F).
