Foreword

This series documents the scientific basis for the evaluation of aquatic resources and ecosystems in Canada. As such, it addresses the issues of the day in the time frames required and the documents it contains are not intended as definitive statements on the subjects addressed but rather as progress reports on ongoing investigations.

Research documents are produced in the official language in which they are provided to the Secretariat.

ABSTRACT

This document presents the data sets from the *Nephrops* trawl surveys conducted off the Magdalen Islands from 1995 to 2012 which were used to develop indicators for assessing lobster stock status for the Magdalen Islands Lobster Fishing area (LFA 22) in 2012.

RÉSUMÉ

Ce document présente les données provenant des relevés au chalut *Nephrops* effectués au large des îles de-la-Madeleine de 1995 à 2012 et qui ont servi à élaborer des indicateurs pour l'évaluation de l'état du stock de homard de la zone de pêche au homard (ZPH) des îles-de-la-Madeleine (ZPH 22) en 2012.

INTRODUCTION

The assessment of the status of lobster stocks along the Quebec coasts is based on the examination of a series of indicators developed using data primarily from the commercial fishery (statistics, logbooks and sampling at sea on fishing vessels and dockside). For some Lobster Fishing Areas (LFAs), it is also based on indicators from fishery-independent data. This is the case for the Magdalen Islands (LFA 22), where, since 1995, indicators of abundance indicators, demography, productivity (reproduction and recruitment) and fishing pressure have been developed from data from a trawl survey.

This paper presents data from the trawl surveys for the 1995-2011 period that were used for the last stock assessment, in winter 2012, to which the 2012 data were added. These data were used to develop the indicators (Gendron and Savard 2012) and produce an advice on the status of the lobster stock for the Magdalen Islands (DFO 2012).

These data stem from the Fisheries and Oceans Canada, Canadian Science Advisory Secretariat, Regional Advisory Meeting of February 1 and 2, 2012 on "Assessment of Lobster Stock Status in the Coastal Waters of Quebec." Publications resulting from this meeting will be posted on the [Fisheries and Oceans Canada Science Advisory Schedule](#) as they become available.

The next stock assessment of lobster is scheduled in 2015.

MATERIAL AND METHODS

DESCRIPTION OF THE SURVEY

The trawl survey is conducted in the eastern part of the Magdalen Islands (LFA 22) at depths ranging from 7 to 35 m (Figure 1). The survey is based on 50 fixed stations, 6 of which are located in Plaisance Bay (Table 1). Two sets of tows approximately 100 to 200 metres apart were made each year at 20 stations (including three in Plaisance Bay) to obtain data on the variability of lobster abundance over short distances. This was needed to calculate variograms that are used to estimate lobster (trawlable) abundance (Gendron and Savard 2012). From 1995 to 1998, two trawl sets were done at each station.

The survey was performed using a *Nephrops* bottom trawl equipped with doors with a 20-metre headline. The trawl mesh was 80 mm, 60 mm and 50 mm at the wings, body and codend respectively. Towing speed was 2.5 to 3 knots for 11 to 12 minutes so as to sweep 1,000 m during each set. A Scanmar probe installed on the wings of the trawl was used to determine the horizontal opening of the trawl. Data on opening were collected at every minute for all the duration of the set. The average opening was about 8 metres, so that an area of approximately 8,000 m² was swept on each tow.

The location of sampling stations was initially determined using a systematic sampling plan. However, stations located on reefs were moved to adjacent soft bottoms. The final location of the stations was determined based on maps produced by the Canadian Hydrographic Service (CHS). Bathymetric multibeam surveys were conducted in the area by the CHS between 1996 and 2001 with the Frederick G. Creed equipped with a Kongberg Simrad EM-1000 sounder.

The CHS has also produced images from these surveys. Here we present a color image of the bathymetry as well as a greyscale image of the backscatter data (Figure 2).

Table 1. Characteristics of the Nephrops trawl survey conducted off the Magdalen Islands from 1995 to 2012.

Year	Sampling period	Number of stations*	Number of tows	Number of lobsters captured
1995	8-22 September	39	84	7 956
1996	5-13 September	44 (addition stations #41-46)	88	6 123
1997	4-13 September	47 (addition Plaisance Bay)	99	8 431
1998	3-13 September	50 (addition stations #47-48)	94	8 176
1999	2-10 September	50	76	6 958
2000	5-11 September	46	59	6 010
2001	3-10 September	50	72	7 444
2002	3-10 September	50	65	6 751
2003	11-18 September	50	70	5 968
2004	1-11 September	47	63	7 302
2005	2-13 September	50	77	7 190
2006	7-13 September	46	61	6 446
2007	6-13 September	50	68	7 837
2008	6-13 September	50	67	9 267
2009	5-13 September	49	69	9 145
2010	5-14 September	42	57	8 818
2011	7-13 September	50	68	12 246
2012	4-13 September	50	74	8 745

*From 1998, the maximum number of stations (50) was not always met because of meteorological conditions or presence of fishing gears on the station.

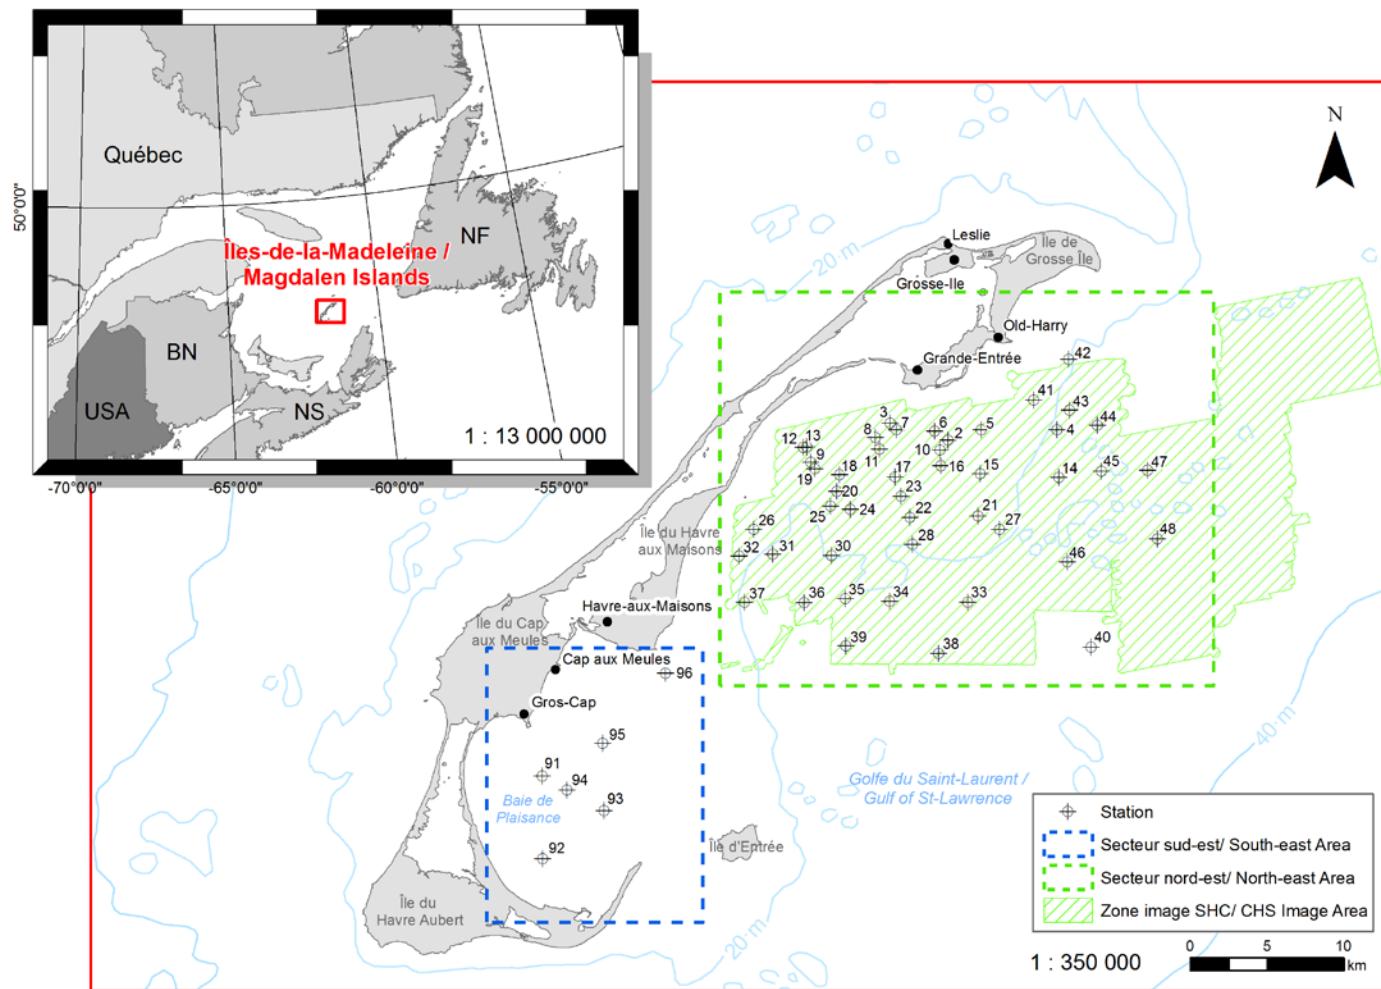

Figure 1. Location of the stations of the Nephrops trawl surveys conducted in the north-east (1995-2012) and south-east (Plaisance Bay) (1997-2012) areas of the Magdalen Islands.

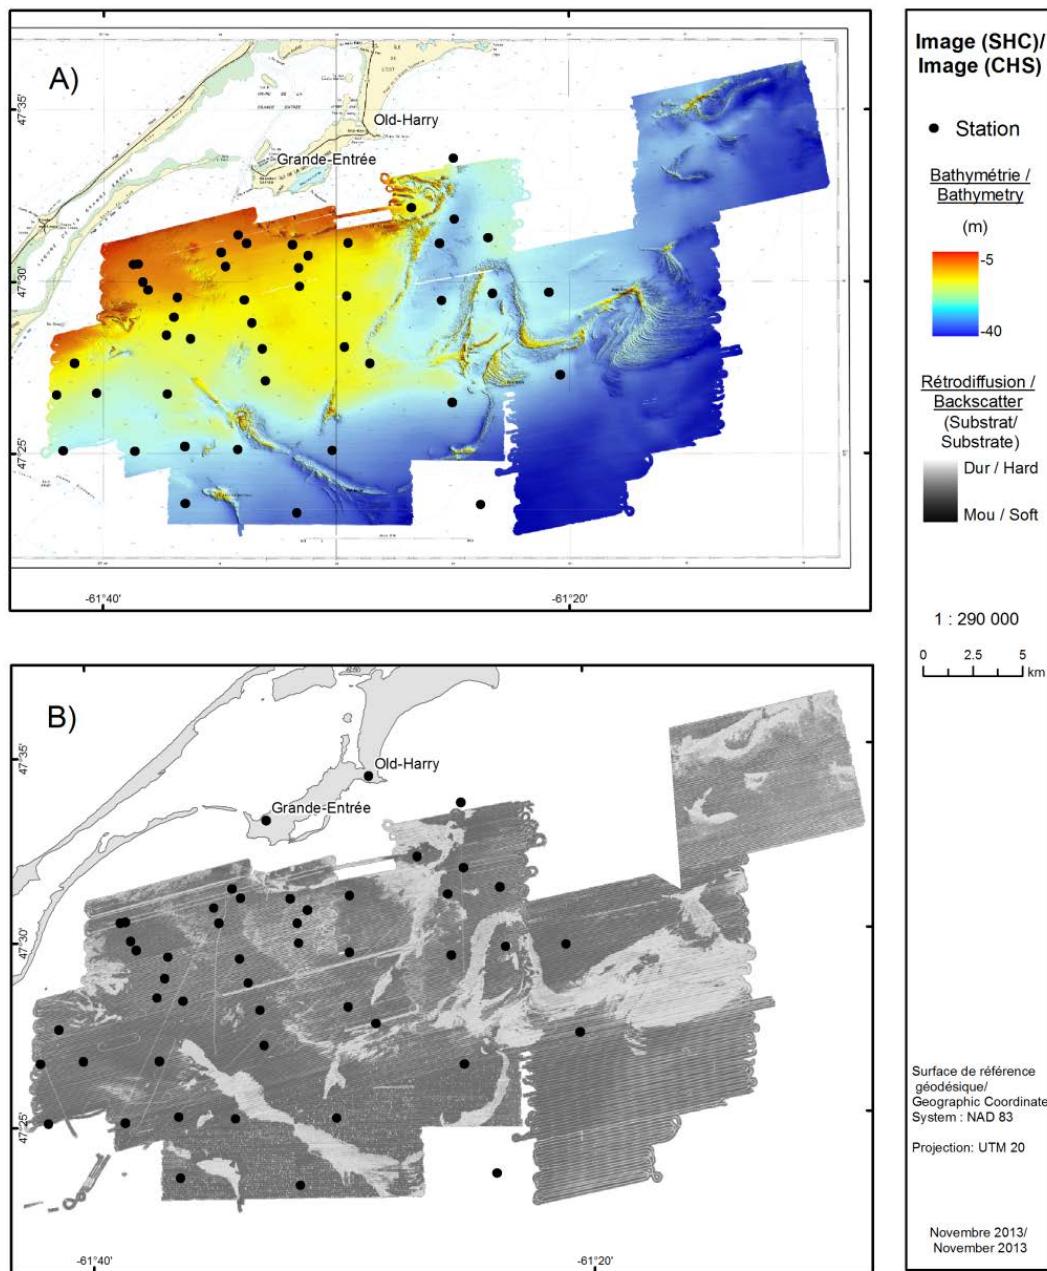

Figure 2. Bathymetry (A) and backscatter (B) images produced by the Canadian Hydrographic Service (CHS) from multibeam surveys conducted off the Magdalen Islands (north-east area) between 1996 and 2001.

DATA ACQUISITION AND COMPIRATION

All lobsters caught were measured (carapace length, CL) and sexed and shell condition was recorded to identify molting stage (pre molt, molt, inter molt and post molt). The eggs of berried females were sampled to determine the degree of embryonic development. As of 2004, recently molted females ≥ 80 mm CL were examined to determine whether a sperm plug in the entrance of the seminal receptacle was present. A sperm plug indicates that the female has mated and that there is sperm in the seminal receptacle, which provides an indication of mating success.

The surveys were conducted in September after the molting period and when the lobsters are located near the coast. The commercial portion of the sample population therefore represents the population that will be available to the fishery the following spring. In addition to the geostatistical analysis of the commercial portion, a statistical average of the lobster density was also calculated for other lobster classes (berried females, mature females and prerecruits) (Gendron and Savard 2012).

For each year, from 1995 to 2012, and for each trawl set, the total density (TOT) of lobsters was compiled. The number of lobsters caught was divided by the swept area (total length of the trawl set \times average opening). The average opening was calculated on the opening data collected between the third and the tenth minute after the beginning of each tow. All densities were expressed in number/1,000 m². The density of commercial size lobster (COM) (CL \geq minimum catch size, MCS) was also calculated. Commercial lobsters were divided into two categories to distinguish the first molt class recruited to the fishery (COM_1) from the others (COM_2): those lobsters that survived one or two years of fishing. Size limits of these two categories were adjusted to take into account every increase in MCS (Table 2). The upper limit of the first molt class was based on known growth rates (Dubé 1985, L. Gendron, unpublished data).

Sizes were converted to weight using the standard equations (see Gendron and Savard 2012) and total (WGT_TOT) and commercial (WGT_COM) lobster biomass (kg/1,000 m²) was also calculated.

The average density of prerecruits was calculated. Three categories of prerecruits were defined. The first (PR1) corresponds to prerecruits who are one molt below MCS. The lower size limit for this class is about 10 mm below the MCS. Individuals in the PR1 class reach commercial size at the next molt, assuming a 15% growth increment at molting (Dubé 1985, L. Gendron, unpublished data). The size limits for PRE1 category were modified over the years to reflect changes in the MCS (Table 2). The second category includes individuals whose size CL (mm) is within the interval $55 \leq CL < 67$ mm (PR2). These lobsters will make two or three molts before reaching the MCS. With the increase of TMC, a gap appeared between PR_1 and PR_2, which corresponds to the variable PR_1 - PR_2.

The third category includes all lobsters < 55 mm and were included in the juvenile class (JUV). The JUV category was also subdivided into two categories, lobsters $45 \leq CL < 55$ mm (PR3) and those < 45 mm (PR4). Lobsters of the PR4 category (about 3 to 4 years old) are and emerging from nurseries and beginning their vagile phase. They will reach commercial size only 5 to 6 years later (see Gendron and Sainte-Marie 2006).

The density of egg-bearing females (BERF) has been calculated and that of females defined as sexually mature (≥ 79 mm CL) (FMAT), according to the maturity ogive (see Gendron and Savard 2012). A compilation of the theoretical egg production (number/1000 m²) (EGGS).was made by summing individual egg production of each mature female of the tow, obtained from the size-fecundity relationship (see Gendron and Savard 2012).

Table 2. Sizes of the various categories of commercial lobsters (COM \geq MCS, COM_1, the first molt class recruited to the fishery and COM_2, lobsters that survived 1-2 years of fishing) and of prerecruits (PR1, prerecruits one molt below commercial size) from 1995 to 2011. Sizes vary with the minimum catch size (MCS) in effect the year following the survey (t+1).

Year of the survey (t) MCS (t+1)	COM	COM_1	COM_2	PR_1
1995 (76 mm)	≥ 76 mm	$\geq 76\text{-}86$ mm	≥ 87 mm	67- <76 mm
1996 (77 mm)	≥ 77 mm	$\geq 77\text{-}87$ mm	≥ 88 mm	68- <77 mm
1997 (78 mm)	≥ 78 mm	$\geq 78\text{-}89$ mm	≥ 90 mm	69- <78 mm
1998 (79 mm)	≥ 79 mm	$\geq 79\text{-}90$ mm	≥ 91 mm	70- <79 mm
1999 (80 mm)	≥ 80 mm	$\geq 80\text{-}91$ mm	≥ 92 mm	71- <80 mm
2000 (81 mm)	≥ 81 mm	$\geq 81\text{-}92$ mm	≥ 93 mm	72- <81 mm
2001 (82 mm)	≥ 82 mm	$\geq 82\text{-}93$ mm	≥ 94 mm	72- <82 mm
2002-2012 (83 mm)	≥ 83 mm	$\geq 83\text{-}94$ mm	≥ 95 mm	73- <83 mm

RESULTS

LAT LONG positions corresponding to the center of the first tow of each station are presented in Appendix 1. Depth is also indicated, classified into four strata (1: <15 m, 2: 15 m to <20 m, 3: 20 m to <25 m and 4: ≥ 25 m). The densities for each of the 15 variables presented above, for each of the trawl sets, from 1995 to 2012 in the north-east of the Magdalen Islands (stations 2-48) and in the area of Plaisance Bay (stations 91-96) are presented in Appendix 2 . Densities are expressed in number of lobsters/1000 m². Weights are in kg/1000 m².

Maps of lobster density are presented for the north-east area of the Magdalen Islands for:

- 1) the total density of lobster (TOT) (Figures 3 and 4),
- 2) commercial density (COM) (all lobsters ≥ minimum catch size, MCS, MCS has varied over the years, see Table 2) (Figures 5 and 6),
- 3) the density of juvenile lobsters <55 mm CL (JUV) (Figures 7 and 8) and
- 4) the density of egg-bearing females (BERF) (Figures 9 and 10).

For each category of lobster, maps are presented with background images of bathymetry and reflectivity produced by the CHS. Density maps for these categories of lobster are also presented for Plaisance Bay (Figures 11, 12, 13 and 14), but without a background image. It is known that the bottom in this area consists almost exclusively of sand. In cases where there were two trawl sets for the same station, densities shown on the maps are an average of the two sets of the station and are positioned in the middle of the first set (tow 1).

ACKNOWLEDGMENTS

The authors thank the crew of the Calanus II as well as the scientists—biologists and technicians—that participated to the research surveys and the Canadian Hydrographic Service (CHS) personnel for carrying out the surveys and producing the bathymetry and backscatter images. The authors wish to thank Sylvie Brulotte and Charley Cyr for reviewing this document.

APPENDIX 2: LOBSTER DENSITIES AND WEIGHT

Lobster densities (number/1000 m²) and lobster weight (kg/1000 m²) for each trawl set (TR) and station (ST) sampled from 1995 to 2012 (Year) with the *Nephrops* trawl off the Magdalen Islands (Appendix tables 2 and 3) for the following lobster categories:

TOT : Total lobster density.

COM : Commercial density (all lobsters \geq minimum catch size, MCS). MCS has varied through the years (see Table 2).

COM_2 : Density of lobsters that survived 1-2 years of fishing. (See Table 2 for size limits as a function of MCS).

COM_1 : Density of lobsters from the first molt class recruited to the fishery. (See Table 2 for size limits as a function of MCS).

PR_1 : Prerecruits one molt below commercial size (See Table 2 for size limits as a function of MCS).

PR_2 : Prerecruits two or more molts below commercial size, $55 \leq CL < 67$ mm. (CL = carapace length).

PR1 – PR_2 : Density of lobsters with sizes between those of PR_1 and PR_2.

PR_3 : Density of lobsters $45 \leq CL < 55$ mm.

PR_4 : Density of lobsters < 45 mm CL.

JUV : Density of lobsters < 55 mm CL (sum of PR_3 and PR_4).

BERF : Density of berried females.

FMAT : Density of females considered sexually mature (≥ 79 mm CL).

EGGS : Egg density. Estimation of a theoretical egg production (sum of eggs of each FMAT of the trawl set, calculated from the size-fecundity relationship)

WGT_TOT : Total weight of caught lobsters (conversion of length into weight).

WGT_COM : Weight of commercial lobsters (CL \geq MCS) (conversion of length into weight).

Appendix Table 1. Lobster densities (number/1000 m²) and lobster weight (kg/1000 m²) for each trawl set (TR) and station (ST) sampled from 1995 to 2012 (Year) with the Nephrops trawl off the Magdalen Islands: north-east area.
