Canadian Data Report of Fisheries and Aquatic Sciences

These reports provide a medium for filing and archiving data compilations where little or no analysis is included. Such compilations commonly will have been prepared in support of other journal publications or reports. The subject matter of Data Reports reflects the broad interests and policies of the Department of Fisheries and Oceans, namely, fisheries management, technology and development, ocean sciences, and aquatic environments relevant to Canada.

Numbers 1-25 in this series were issued as Fisheries and Marine Service Data Records. Numbers 26-160 were issued as Department of Fisheries and the Environment, Fisheries and Marine Service Data Reports. The current series name was changed with report number 161.

Data Reports are not intended for general distribution and the contents must not be referred to in other publications without prior written clearance from the issuing establishment. The correct citation appears above the abstract of each report.

Rapport statistique canadien des sciences halieutiques et aquatiques

Ces rapports servent de base à la compilation des données de classement et d'archives pour lesquelles il y a peu ou point d'analyse. Cette compilation aura d'ordinaire été préparée pour appuyer d'autres publications ou rapports. Les sujets des Rapports statistiques reflètent la vaste gamme des intérêts et politiques du Ministère des Pêches et des Océans, notamment gestion des pêches, techniques et développement, sciences océaniques et environnements aquatiques, au Canada.

Les numéros 1 à 25 de cette série ont été publiés à titre de Records statistiques, Service des pêches et de la mer. Les numéros 26-160 ont été publiés à titre de Rapports statistiques du Service des pêches et de la mer, Ministère des Pêches et de l'Environnement. Le nom de la série a été modifié à partir du numéro 161.

Les Rapports statistiques ne sont pas préparés pour une vaste distribution et leur contenu ne doit pas être mentionné dans une publication sans autorisation écrite préalable de l'établissement auteur. Le titre exact paraît au haut du résumé de chaque rapport.

ABSTRACT

Hourston, A. S. 1981. Tagging and tag recovery data for British Columbia herring, 1937-1967. Can. Data Rep. Fish. Aquat. Sci. 308: vii + 276 p.

Herring taggings in British Columbia between 1937 and 1967 are presented in a consolidated listing. Actual recoveries and recoveries adjusted for catches not searched for tags are arrayed for the winter and summer fisheries by year of tagging and by years at large. Recoveries from reduction plant magnets and by electronic detectors are shown separately, as are recoveries of juvenile tags. All data are summarized by section and division.

Key words: Clupea harangus pallasi, tagging, tag recovery.

RÉSUMÉ

Hourston, A. S. 1981. Tagging and tag recovery data for British Columbia herring, 1937-1967. Can. Data Rep. Fish. Aquat. Sci. 308: vii + 276 p.

On présente une liste complète des étiquetages de hareng qui ont été faits en Colombie-Britannique entre 1937 et 1967. Les récupérations réelles et les récupérations établies pour les prises dont on n'a pas examiné les étiquettes sont réparties pour la pêche d'été et d'hiver par année d'étiquetage et par année. Les récupérations faites grâce aux aimants des usines d'épuration et aux détecteurs électroniques sont indiquées séparément, ainsi que les récupérations des jeunes individus. On donne un résumé des données par section et par division.

Mots-clés: Clupea harangus pallasi, étiquetage, récupération d'étiquettes.

INTRODUCTION

The tagging of herring in British Columbia waters was initiated during the winter of 1936-37 using coded metal body-cavity tags; tags were recovered by magnets in the plants which reduced the fish to meal and oil and by electronic detectors on the conveyor belts which brought the fish into the plant (Hart and Tester 1937). Tagging was continued each year until the 1955-56 season, when it was considered that the general relationship between most major populations was sufficiently well understood for the practical purposes of management (Taylor et al. 1957). Taggings conducted and tags recovered were reported annually during that period (Hart and Tester 1937, 1938, 1939, 1940; Hart et al. 1941, 1942; Tester and Boughton 1943; Tester 1944, 1945, 1946; Tester and Stevenson 1947, 1949; Stevenson 1950; Stevenson and Lanigan 1951; Stevenson et al. 1952, 1953; Stevenson and Outram 1953; Taylor and Outram 1954; Taylor 1955; Taylor et al. 1956, 1957). In addition, juvenile (first year) fish were tagged on the west coast of Vancouver Island in 1951, 1952 and 1953 (Hourston 1959) and in the Gulf of Georgia in 1955-56 (Taylor 1973a) using a smaller form of the same body-cavity tags.

During the next ten years, several localized tagging programs were conducted to study specific problems. These included taggings in 1957 on the northern and central coasts and on the east coast of Vancouver Island, in 1964 in the northern half of the province, 1965 on the west coast of Vancouver Island and in 1967 on the upper east coast of Vancouver Island (Taylor 1973b).

The cumulative results of these tagging programs have been utilized to identify major populations (Tester 1949, Taylor 1964) and to determine the movements of stocks (Stevenson 1955) and the interrelationships between them (Taylor 1973a).

Stock definitions have undergone a series of modifications with the increase in both the extent and the content of the data base (Tester 1949, Taylor 1964, Hourston 1978). Management practices for the current roe fishery require finer breakdowns into substocks (management units--see Hourston and Hamer 1979) than have been previously employed. This report was undertaken to consolidate all of the previous tag recovery data in a form related to current geographical units.

METHODS AND RESULTS

Tagging data (Table 1) were arrayed by year and section (Figs. 1, 2), the smallest geographic unit used in current analyses. Recoveries were originally reported by statistical area (Figs. 3, 4) and this format has been retained. Sections are subdivisions of both statistical areas and management units (Fig. 5), which are the basic units of current stock assessments.

Tag recoveries were sorted in a number of ways. Because detector recoveries were made at the time of unloading, the location and date of capture of the tagged fish could be determined with some confidence. Magnet recoveries, on the other hand, could not be traced to individual landings because the time of entry to the plant could not be accurately determined. Consequently, unless all of the catch being processed at that time came from one area, these recoveries could only be assigned to a group of areas represented in the catches processed during that run. Moreover, since tags frequently got caught in the machinery during processing, the chances of error in assigning them to a particular batch of fish processed were much greater. Because of this gross difference in precision, detector and magnet recoveries were compiled separately.

A second level of sorting involved separating recoveries from the summer and winter fisheries. The former would have come from fish on or near their feeding grounds while the latter would have come from fish on their annual spawning migration. Consequently, the same stock of fish could be in quite different areas in summer than in winter and fish taken from one area in the summer could come from completely different stocks from fish taken in the same area in winter.

A third level of sorting was to record the recoveries of juvenile tags separately from those of adult tags. The former tags were applied to smaller (first year) fish with presumably a higher tagging mortality rate, at large for a longer period ($16 \pm$ months during their "first" year) and provided a weaker target for detectors and magnets because of their smaller size. All of these factors would tend to reduce the recovery rate. Moreover, straying patterns are different from those of fish that had already spawned at least once (Hourston 1959).

A fourth level of separation was between actual and adjusted recoveries. In the latter, actual recoveries were adjusted upwards to account for the proportion of tags not picked up by the detector and/or magnets (determined from test runs of a known number of tags applied to fish entering the plant) and to estimate the number of recoveries that would have been made had the entire catch been searched for tags. Thus, adjusted recoveries provide a more realistic basis for quantitative estimates of the extent of homing by individual stocks or of mixing between stocks. Actual recoveries on the other hand, provide the data base for the above and a more reliable basis for more general interpretations of fish movements.

A fifth item to be taken into account in arraying the recovery data is time. The distribution of fish amongst the various spawning grounds on the coast is not constant from year to year, (Hourston 1980) so different mixes of fish may be tagged from one year to another. On the other hand, the opportunity for straying would be expected to increase with the number of years between tagging and recovery. For this reason, recoveries were summarized both by year of tagging and by years at large.

Taking all of the above into account, actual tag recoveries were summarized for the winter fishing by year of tagging (Table 2) and years at large (Table 3). Actual recoveries from the summer fishery were also arrayed by year of tagging (Table 4) and years at large (Table 5). Adjusted

tag recoveries were similarly arrayed (Tables 6-9). Magnet and detector recoveries are shown separately in each table.

The numbers of herring tagged were summarized by section and year for each of the six divisions (Tables 10-15) and by division (Table 16). Actual and adjusted recoveries were summarized by section and year of tagging for each of the six divisions (Tables 17-22 and 24-29 respectively) and by division and year of tagging (Tables 23 and 30 respectively). Actual and adjusted recoveries were also summarized by section of tagging and area of recovery for each division (Tables 31-36 and 38-43 respectively) by division of tagging and of recovery (Tables 37 and 44 respectively), and by years at large and area of recovery for each tagging area (Tables 45 and 46 respectively).

It will be noted that some values for actual recoveries have corresponding adjusted recoveries which are smaller or even zero. This anomaly results from differences in the methods of estimating the adjusted recoveries (estimates of the numbers of tags available from the entire catch). In the earlier years, these estimates were generally the same as the actual recoveries because of the lack of information on tonnage searched for tags and on magnet or detector efficiency; adjustments were made however whenever such data were available. Between the 1944-45 and 1951-52 seasons, adjusted recoveries were based on detector recoveries only; in some instances during these years, there were some tagging sections for which there were magnet recoveries but no detector recoveries (and therefore no adjusted recoveries) or for which the actual recoveries by both magnets and detectors exceeded the adjusted recoveries. However, on a broader basis (division or area) where the numbers of detector returns was sufficiently large, the adjusted recoveries should be representative of the tags available from the total catch. Following the 1951-52 season, the use of tag detectors was abandoned and adjusted recoveries were estimated from magnet returns only.

Finally, it should be noted that the small catch during the 1952-53 season, which resulted from an industrial dispute, was not searched for tags by any means. Moreover, recovery data for the 1956-57 season may be incomplete because of a change in the form of the data records during that season.

ACKNOWLEDGMENTS

The assistance of Debra Lebroq, Lorena Rosenfeld, Faye Winters and numerous other term employees who participated in compiling the data is gratefully acknowledged. Doug Miller prepared the figures.

TABLE 16. SUMMARY OF NUMBERS OF HERRING TAGGED BY DIVISION AND SEASON (JULY TO JUNE). TAGGINGS OF JUVENILES ARE MARKED WITH "J". YEAR IS REFERENCED BY THE LAST CALENDAR YEAR IN THAT FISHING SEASON (e.g., 1937 FOR THE 1936-37 FISHING SEASON.) NUMBERS TAGGED IN EACH DISTRICT ARE SHOWN IN COLUMN HEADINGS.

| YEAR | QUEEN CHARLOTTE ISLANDS 32951 | TAGGING SECTION | | | | | | TOTAL |

TABLE 37. SUMMARY OF ACTUAL RECOVERIES BY DIVISION OF TAGGING AND OF RECOVERY. DETECTOR RECOVERIES ARE MARKED WITH "D", MAGNET RECOVERIES FROM THE PRECEDING SUMMER FISHERY ARE MARKED WITH "S", RECOVERIES OF JUVENILE TAGS ARE MARKED WITH "JS". RECOVERIES OF JUVENILE TAGS FROM THE PRECEDING SUMMER FISHERY ARE MARKED WITH "JS", NUMBERS TAGGED IN EACH DIVISION ARE SHOWN IN THE COLUMN HEADINGS. NUMBERS IN "RECOVERED IN" COLUMN REFER TO DIVISIONS NAMED IN COLUMN HEADINGS.

TABLE 46.10. SUMMARY OF ADJUSTED RECOVERIES FROM THE WINTER FISHERY BY YEARS AT LARGE FOR EACH TAGGING AREA AND BY RECOVERY AREA FOR TAGGINGS IN AREAS 25 AND 26.
DETECTOR RECOVERIES ARE MARKED WITH "D". MAGNET RECOVERIES FROM THE PRECEDING SUMMER FISHERY ARE MARKED WITH "S".
