Canadian Manuscript Report of Fisheries and Aquatic Sciences

#### Abstract

Mandectupt repots contath ccientific and techuical informatant that semtrobe ta exsting knowledge but a bich deals wilf hatiwal a; Mgivad probleas. Distribution is restricted to institutions or individuak located in particular retions af Canxda  interests and pulcies of the Departucent of Fisheries and Occoses, Manely. fosheries and aquatic sciences.

Manuscript reports may be cited as full puhblicutions. The courcer citation appears above the abstract of each repott. Each repott is abstracted in Aymatie Seiences aphe Fobleries fhatrews and indexed in the Depratments anmuat indes to seientifie and technicat publications.

Numbers 1900 in this scries were issued as Mantsctipt Reports (Biohogical Series) of the Biological Buard of Canadat, and subscquent to 1937 when the name of the Board was changed by Aet of Parliament, is Manuseripi Report- (Biological Series) of the Fisheries Research Board of Canada: Vumbers $9011+25$ were issued as Manuscript Reports of the Fisheries Research Board of Canada. Numbers 14261550 were issued as Department of Fisheries and the Environment. Fisheries and Marine Service Manuseript Reports. The current series name was changed with report number 1551.

Manuscript reports are prodtucd regionally hut are numbered mationally Requests for individual reports will be filled by the issuing establistiment listed on the front cover and title page. Out-af-stock reports will be supplied for a fee by commercial agents.

## Rapport manuscrit canadien des sciences halieutiques et aquatiques

Les rapports manuscrits contiennent des rensegnements scientifiques et techniques qui constituent une contribution aux connaissances actuelles, mais quil watent de problemes nationaux ou regionaux. La distribution en est limité aux organismes et
 sujet: de fait. la série reflette la vaste gamme des interêtset des palitiques du minivtere des Peches et des Oceans. éest-i-dire les sciences halieutiques et aquatiques.

Les rapports manukcrits peuvent étre cités comme des publications complètes is
 résumés dans la revue Resumés dex sctetres aquatiquen et hatueutiques. et ils sont classes dans Findex annoel des publications scientifiques et techmiques du Ministere.

Les numéros 1 à 900 de cette série ont été publiés à titre de manuserits (serie
 de cet organisme par déret du Parlement, en 1937, ont été elasses comme manuscrits (serie biologiquelde COffice des recherches sur les pécheries du Canada. Les numeros 901 ä 1425 ont ete publiés a titre de rapports manuscrits de loffice des recherches sur
 manuscrits du Service des pêches et de la mer, ministêre des Péches et de l'Eovironnement. Ie nom actuel de la serie a ete etabli lors de la parution du numero 1551.

Les rapports manuscrits sont produrits à líchelon rétional. mais numérotés à Techelon national. Ies demandes de rapporis seront saftstaites par letahlissement auteur dont le nom figure sur la couverture et la page du titre. Les rapports epuisés seront fournis contre rétribution par des agents commerciaux.

ABSTRACT

Shardlow, T. $F_{\text {. }}$ and L. D. Collicutt. 1989. Strait of Georgia sport fishery creel survey statistics for salmon and groundfish, 1985. Can. MS Rep. Fish. Aquat. Sci. 2033 : 60 p.

Catch and effort statistics for the Strait of Georgia tidal sport fishery are presented for each month in 1985. The statistics were derived by combining the data from over 39,000 interviews and 69 aerial surveys. Estimates were provided for the number of sport fishing boat trips and the catches of chinook, coho, and pink salmon along with rockfish, lingcod, dogfish and other finfish. Also given are numbers of marked (adipose fin-clipped) and unmarked chinook and coho examined during the creel survey, and the age composition and length distribution of chinook catches. The appendix includes all catch and effort statistics for each combination of month and Statistical Area.

Keywords: salmon, groundfish, creel survey, sport fishing, catch, effort, age composition, length distribution.

## RÉSUMÉ

Shardlow, T. F. and L. D. Collicutt. 1989. Strait of Georgia sport fishery creel survey statistics for salmon and groundfish, 1985. Can. MS Rep. Fish. Aquat. Sci. 2033 : 60 p.

Les statistiques relatives aux prises et a l'effort de pêche de la pêche sportive de la zone tidale du détroit de Géorgie sont présentées pour chaque mois de 1985. Ces valeurs ont été obtenues en réunissant les données de plus de 39,000 entrevues et 69 relevés aériens. On $y$ trouve les estimations du nombre de sorties des bateaux de pêche sportive et des prises de saumons quinnat, coho et rose en plus de celles de scorpènes, d'ophiodon, d'aiguillat et d'autres poissons. Le nombre de saumons quinnat et coho marqués (coupe de la nageoire adipeuse) et non marqués examinés au cours des relevés des prises et la composition par âges et la distribution par longueur des prises de saumon quinnat sont aussi présentés. On trouve aussi en appendice toutes les statistiques relatives aux prises et à l'effort de pêche pour chaque mois et combination de zones statistiques.

Mots clés: saumon, poisson de pond, releve des prises, pêche sportive, prises, effort de pêche, composition par âges, distribution par longueur.

### 1.0 INTRODUCTION

This report documents the 1985 catch and effort statistics for the Strait of Georgia sport fishery and discusses methodology for collecting these data. During the 1970s, the sport fishery grew to be the largest harvester of chinook and coho salmon in the Strait of Georgia. Figure 1 and Table 1 show historical catch statistics for the Strait of Georgia sport fishery for the period 1960-1985. Prior to 1980, fisheries managers recognized the need for accurate catch statistics. In 1980, the Strait of Georgia Creel Survey Program was initiated to meet the need for accurate and timely sport catch statistics primarily for chinook and coho. Since then, the objectives of the Creel Survey Program have been expanded to provide accurate estimates of all major sport-caught finfish, and age and length composition of chinook catches. This report is one of a series of Strait of Georgia Creel Survey Reports which document annual creel survey activities and estimation procedures, and provide official published Strait of Georgia tidal sport fishery catch statistics.

In 1985 the creel survey gathered a comprehensive set of annual sport fishing data for Strait of Georgia. There were no project interruptions during the year, and both aerial survey and interview data were collected on a continuous basis for the first time.

In this report, all figures, tables and appendices are located at the end of text.

### 2.0 METHODS

The Strait of Georgia Creel Survey is comprised of two independent surveys: angler interviews and aerial overflights. Angler interviews provide data on sport fishing catch per unit effort (CPE) and daily activity patterns. Aerial overflights provide estimates of the total sport fishing effort in the study area at the time of the aerial survey. These data are combined to provide monthly estimates of total sport fishing effort and total catch of salmon and groundfish in the sport fishery. In its simplest form, the estimated total catch is calculated by multiplying estimated total effort by catch per unit effort.

The design of the Strait of Georgia Creel Survey conducted in 1985 was similar to that used in 1984. Sampling was conducted during each month of the year and estimates were produced for 10 time periods. January and February data were grouped together, as were November and December data because of reduced fishing activity and sampling in these winter months. Mid-week days and weekend days were considered independently because sport fishing activity is known to be quite different between the two types of days. The Strait of Georgia study area was also stratified by geographic region. Catch and effort statistics were produced for each of the 10

Statistical Areas within the Strait of Georgia (Areas 13-19A, $19 \mathrm{Bt}, 28$ and 29, Fig. 2); Statistical Area $19 \mathrm{~B}+$ includes the portion of Area 20 east of Sheringham Point (see Appendix $C$ for a complete description of the study area). Data collection, entry and preliminary processing were conducted for most of the year by DPA Consulting Ltd., and are reported in their 1985 document. Estimation of catch and effort statistics was conducted by the Department of Fisheries and Oceans.

### 2.1 FIELD SURVEYS

### 2.11 Angler Interviews

Sport fishermen were interviewed at the end of their fishing trip to determine time spent fishing, locations fished and catch of each species on the trip. Demographic information was also collected during each interview. Figure 3 shows the interview form used in 1985.

Interviewers trained in fish identification inspected each boating party's catch. Unlike other methods of collecting sport fishery information, such as mail-in or telephone surveys, there was little memory-related recall bias, non-response bias, and fish identification concern with this approach to determining sport fishery catch. Landed chinook and coho were checked for a missing adipose fin which indicates the presence of a coded wire tag embedded in the fish nose cartilage. In addition, scale samples for age determination and measurements for nose-fork length were taken during every sampling shift in the winter and every other shift in the summer. Five scales were removed from the INPFC (International North Pacific Fisheries Commission) preferred area of each biosampled chinook (Mosher 1968).

The interviews were conducted at 31 landing sites (boat ramps, marinas, or resorts, Fig. 2) representative of sport fishing activity in each Statistical Area. The number of sites selected in each area was dictated by targets of desired precision and number of surveyors available. For each area - day type - work block stratum, sampling shifts at a site were chosen on a near random basis from the total number of shifts available. For definition of the above terms (day type, work block, shift) see Appendix A.

### 2.12 Aerial Overflights

Aerial surveys, conducted from float planes travelling along pre-defined routes, allowed observers to count vessels actively sport fishing throughout the Strait of Georgia. Planes flew at an altitude of 500-700 feet to facilitate a broad range of vision and still allow easy identification of vessel characteristics. Each plane carried three observers, two on the right side and one on the left, and each observer counted sport fishing boats to his/her side of the flight path. Figure 2 shows the flight path used in 1985. The winter (October - April) flight path was slightly reduced to correspond with lower winter effort.

The flight path and time of departure were designed to cover major concentrations of sport fishing activity at peak periods. Whenever possible, the route was flown to keep most of the sport fishing boats to the right side to allow averaging of the two right side counts. To maximize precision, flying times during which fishing effort was rapidly changing were avoided. The number of overflights each month was governed by targets of desired precision and the expected number of interviews from the given number of sampling shifts (English et al. 1986). The days for overfights during a month were randomly selected for each day type.

### 2.2 DATA ANALYSIS

Data analysis included calculation of catch and effort statistics, calculation of variance of total fishing effort and total catch, estimation of marked chinook and coho salmon, and estimation of age composition of chinook catch. Appendix A details the methods and equations used in the above data analysis.

### 3.0 RESULTS

### 3.1 DISTRIBUTION OF SAMPLING EFFORT

Table 2 shows the number of creel survey interviews conducted by month and Statistical Area in 1985, and the number of monthly overflights. A total of 39,801 interviews ( 33,494 fishing interviews) and 69 overflights were conducted in 1985. The monthly distribution of interviews reflected the monthly distribution of fishing effort (number of boat trips, Table 3) (Fig. 4). Interview effort was reduced during winter months, especially for Statistical Areas 13, 14 and 15 in the northern portion of Strait of Georgia (Table 2). The total fishing interviews represented $5.3 \%$ of the estimated total fishing effort for the entire study area ( 628,513 boat trips, Table 3) and ranged in each Statistical Area from a low of $1.9 \%$ of the estimated fishing effort in Area 15 to a high of $9.0 \%$ in Area 28 (Tables 2 and 4 ).

### 3.2 SPORT FISHING EFFORT AND CATCH

The 1985 Strait of Georgia sport fishing effort and catch statistics are summarized for each species by month in Table 3 and by Statistical Area in Table 4. Appendix $B$ shows the fishing effort and catch statistics for each combination of month and Statistical Area.

Sport fishermen made 628,513 boat trips during 1985, which is similar to the annual fishing effort since 1980 (Table 1). The fishing effort followed the same general seasonal pattern as seen in previous years (Fig. 5). Effort levels climbed steadily from April, peaked in August, and declined rapidly in September and October.

The total finfish sport catch in the Strait of Georgia in 1985 was estimated at $1,337,365$ pieces (including steelhead and cutthroat trout, Table 3 ), and consisted of $79 \%$ salmon and $21 \%$ groundfish. An additional 703,264 salmon of mixed species were released by anglers (Appendix B-7). The two main catch groups are discussed below.

Salmon sport catches in the Strait of Georgia in 1985 totalled 1,062,600 pieces (Tables 3 and 4 ) and consisted of $68 \%$ coho, $22 \%$ chinook, $9 \%$ pink salmon and $1 \%$ other salmon.

Chinook sport catches showed a considerable decline from the 1984 level, with anglers taking 234,838 fish (Tables 3 and 4 ) compared to 369,445 in 1984 (Fig. 1, Table 1). The majority of the catch was taken during the months of May, June, July and August (Fig. 6). The annual distribution of catch in 1985 as in 1984, was shifted slightly earlier in the season than in previous years (Fig. 6).

It should be noted here that three new chinook sport fishery regulations were introduced in 1985, that would influence catch levels of chinook. Effective May 15, the daily bag limit was reduced to two chinook on a year round basis. A short time later (June 5), the annual bag limit was reduced from 30 to 20 chinook. In addition to these two changes, a spot closure plan outlining 30 closures, was implemented. This plan was intended to prohibit fishing in specified areas for specific periods of time when chinook were believed to be most readily taken.

Seasonal catch efficiency for chinook showed the same pattern in 1985 as in 1984, with catch per boat trip being higher in early summer than in previous years (Fig. 7, Table 5). The earlier timing of the chinook catch seen in 1984 and 1985 was probably a result of greater than normal abundance of this species during the spring and summer. This greater abundance most likely resulted from a shortened commercial troll season. The commercial troll fishery, which takes the majority of its chinook catch in the spring months (Argue et al. 1987), was delayed in both 1984 and 1985 from April to July.

The highest annual chinook catches in 1985 were taken in Area 13 ( $22 \%$ of total) and Area 14 ( $19 \%$ ), which was similar to the 1983 and 1984 catch patterns (Table 4, Fig. 8). In some months, other Statistical Areas dominated the catch (Appendix B-3). During the summer months (May - September) in 1985, $72 \%$ of the landed chinook were taken in the northern region of the Strait of Georgia - Statistical Areas 13 to 17 . This was expected since the summer chinook catch is normally taken mostly in the north. In the winter months (January - April, October - December), $56 \%$ of the chinook catch came from the southern region - Statistical Areas 18, 19, 28 and 29. During November and December, many of the chinook came from Victoria/Sooke waters in Statistical Area $19 \mathrm{~B}+$ and from Area 16.

The 1985 coho catch of 728,197 pieces (Tables 3 and 4) is the highest recorded for this fishery except for 1978 when an estimated $1,103,000$ coho were caught (Fig. 1, Table 1). Coho catch was above average from April through September (Fig. 9) when over $98 \%$ of the catch was taken. Coho catches remained high despite similar or lower summer effort in 1985 compared to 1982 and 1984 (Fig. 5). This combined to produce mean monthly catch per boat trip of up to 1.7 fish (Table 5), well above values in previous years (Fig. 10). The highest coho catches were taken in Area 13 ( $36 \%$ of total) and Area 14 ( $30 \%$, Table 4), which is similar to the catch pattern in previous years (Fig. 8).

In 1985, Strait of Georgia anglers caught approximately 91,000 pink salmon between May and October (Table 3). Significant pink catches were expected in 1985 because pink salmon returns to Strait of Georgia rivers (primarily the Fraser River) are much greater in odd numbered compared to even numbered years. Victoria to Sooke waters in Area $19 B+$ were responsible for $84 \%$ of the pink catch (Table 4).

The landings of other salmon consisted of chum and sockeye, and were estimated at about 8,000 pieces (Table 3). The majority of this catch was taken between August and December ( $92 \%$ of total, Table 3). Statistical Areas 13 and $19 B+$ showed the highest catch contribution ( $50 \%$ of total, Table 4). A large portion of the catch in Areas 17 and 19 consisted of chum salmon returning to local rivers, while the Area $19 B+$ catch was mostly sockeye.

In addition to the above salmon species, small numbers ( $<400$ ) of steelhead, cutthroat trout and unidentified salmon were caught in the Strait of Georgia in 1985, bringing the total salmonid catch to $1,062,939$ pieces (Appendix B-6).

The average number of total salmon caught during each boat trip in 1985 was 1.7 (Table 5). This represents a better catch success for salmon than during the 1981 to 1984 period when between 1.0 and 1.3 salmon per boat trip were reported (Shardlow and Collicutt 1989).

In 1985, as in previous years, more salmon were landed and more effort was expended in Area 13 than in any other Statistical Area (Table 4, Fig. 11). Boaters fishing in Area 13 had an average catch of 2.4 salmon per trip. Area 14, as in previous years, recorded the greatest number of salmon hooked and released ( 178,199 ), with Area 13 next at 148,031 pieces (Appendix B-7). These two areas have major coho fisheries characterized by the release of many sub-legal coho.

### 3.22 Groundfish

While salmon accounted for the majority of the total finfish sport catch in the Strait of Georgia in 1985, the groundrish catch of 274,426 pieces made up $21 \%$ of the overall catch (Tables 3 and 4). The species composition of the groundfish catch, based on the Table 4 data, was as follows:

| Groundfish <br> species | Catch | $\%$ Of total <br> groundfish <br> catch | Major catch <br> Area |
| :--- | ---: | ---: | ---: |
| Rockfish (Sebastes spp.) | 134,112 | $49 \%$ | 16,17 |
| Lingcod (Ophiodon elongatus) | 77,103 | $28 \%$ | 13,16 |
| Dogfish (Squalus acanthias) | 4,680 | $2 \%$ | 16,14 |
| Other finfish (Appendix D) | 58,531 | $21 \%$ | 18 |
| Total | 274,426 | $100 \%$ |  |

The majority of the groundfish catch was taken in the summer months, reflecting the seasonal change in fishing effort (Table 3, Fig. 4). Catch by Statistical Area for rockfish was highest in Area 16 (29\% of total) and Area 17 ( $16 \%$, Table 4). Lingcod were caught mainly in Areas 13 and 16 ( $48 \%$ of total for the combined Areas), while the largest dogfish catch came from Areas 16 and 14 (47\% of total for the combined Areas, Table 4). Area 18 produced the largest catch of other finfish ( $29 \%$ of total).

Rockfish species were identified for the entire survey area for the second consecutive year in 1985(Table 6). Applying the identification results to the 1985 rockfish catch estimates (Table 7) showed the following species dominance:

| Rockfish species | Catch | \% Of total rockfish catch | Major catch Area |
| :---: | :---: | :---: | :---: |
| Quillback | 52,942 | 39\% | 16,13 |
| Copper | 21,301 | 16\% | 17 |
| Yelloweye | 13,111 | 10\% | 16 |
| Black | 1,816 | 1\% | 19 B+ |
| Other | 44,942 | 34\% | 17 |
| Total | 134,112 | 100\% |  |

The above "other" rockfish category consisted of tiger, yellowtail, china, canary and unidentified species. The 1985 rockfish species composition and the major catch area per species were similar to the 1984 results (Shardlow and Collicutt 1989).

The catch success (CPE) for rockfish was relatively constant throughout the year and averaged 0.2 fish per boat trip (Table 5). For lingcod, the average catch success was 0.1 fish per boat trip. The catch success for all non-salmon species averaged 0.4 fish per boat trip and was also relatively constant throughout the year. Catch success for total finfish during 1985 was 2.1 fish per boat trip (Table 5). This is higher than in 1983 and 1984 when 1.8 and 1.9 finfish per boat trip respectively, were reported (Shardlow et al. 1989, Shardlow and Collicutt 1989).

### 3.3 BIOLOGICAL DATA

### 3.31 Proportion and Catch of Marked Chinook and Coho

In 1985, 14,498 chinook and 38,196 coho were examined for adipose fin clip marks. Tables 8 and 9 show the observed numbers of marked chinook and coho respectively, by month and region. Data were presented by region since some Statistical Areas had insufficient numbers of fish examined for marks in some months, and those data were included with other Areas. Three regions were defined: the North Gulf represented by Areas 13-16; the South Gulf represented by Areas $17,18,28,29$ and the Saanich Inlet portion of Area 19 (Area 19A); and the Victoria region represented by the remainder of Area 19 (Area 19B+) (Fig. 2).

Among chinook examined for marks, $1.9 \%$ had adipose fin clips. The largest observed proportion of chinook marks was in the North Gulf catch (0.023) and the lowest proportion in the Victoria catch (0.010, Table 8). Among coho examined for marks, $5.9 \%$ had adipose fin clips. The largest observed proportion of coho marks was in the South Gulf catch ( 0.066 ), and the lowest proportion in the Victoria catch ( 0.033 , Table 9). Monthly catch estimates of marked chinook and coho are shown by region in Tables 10 and 11 respectively. The seasonal recovery pattern of marked chinook and coho salmon was generally similar to that observed in 1983 (Shardlow et al. 1989) and 1984 (Shardlow and Collicutt 1989). However, in 1985, the estimated catch of marked coho was higher in the North Gulf (Table 11) compared to the previous two years.

### 3.32 Catch-At-Age for Chinook

During 1985, 1,627 chinook biosamples were collected for age and length analysis. Table 12 shows the monthly number and percent age composition of chinook sampled for age. These data are summarized graphically in Figure 12. The monthly age proportions were applied to the estimated monthly chinook catches to provide breakdown by age group (Table 13). In 1985, the majority of chinook sport catch in the Strait of Georgia consisted of age 3 fish (70.8\%), followed by age 4 (20.6\%), age 2 ( $6.6 \%$ ) and age 5 or older (2.0\%). By comparison, the dominant age groups in the two previous years were ages 2 and 3:

| Catch year | \% Age composition of chinook |  |  |  | Reference |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Age 2 | Age 3 | Age 4 | Age 5 |  |
| 1983 | 57.1 | 25.5 | 14.2 | 3.1 | Shardlow et al, (1989) |
| 1984 | 21.6 | 67.3 | 9.4 | 1.7 | Shardlow and Collicutt (1989) |
| 1985 | 6.6 | 70.8 | 20.6 | 2.0 | This report. |

Figure 12 and Table 12 show a shift in the age composition of sampled chinook and hence of chinook catch, between the first eight months and the remainder of the year. From January to August the catch was dominated by age 3 and 4 fish. From September to December the age 2 class strengthened somewhat, but not as much as in previous years (Shardlow et al. 1989, Shardlow and Collicutt 1989), so that the age 3 class remained dominant (Table 12). The relatively low proportion of age 2 chinook in July to December catches was likely the result of poor age 2 recruitment to the sport fishery. Age 2 chinook generally reach the minimum legal size limit of 45 cm in July (Argue et al. 1983).

### 3.33 Mean Length-At-Age for Chinook

Table 14 shows the mean nose-fork length at age for the 1,627 chinook for which both length and age data were available. Figure 13 shows the length frequency distribution for all the measured chinook (2,056 aged and unaged fish). The largest portion of measured chinook ( 885 fish or $43 \%$ of the total sample) was in the $55-64 \mathrm{~cm}$ length category. This is consistent with the large catch proportion of age 3 fish (Table 13) which were found to have an annual mean length of 60.3 cm (Table 14). Of the total chinook measured in 1985 , $2 \%$
were sub-legal in size (less than 45 cm ) compared to $7 \%$ in 1983 (Shardlow et al. 1989) and $4 \%$ in 1984 (Shardlow and Collicutt 1989). In 1985, most of the sub-legal coho were landed in August and September. Age 2 chinook showed a consistent growth trend from May through December when the mean length increased from 34.0 cm to 55.6 cm (Table 14). The largest chinook sampled ( 99 cm ) was landed at Cheanuh Marina in Area 19 on July 25, 1985, and was 5 years old.

### 4.0 SUMMARY

A sport fishery creel survey was conducted in the Strait of Georgia in 1985 in order to estimate the catches of all the important recreational finfish species and the total sport fishing boat trips. The numbers of chinook and coho salmon with adipose fin clips were also estimated. These data are presented by month and Statistical Area. Monthly age and length compositions of chinook catch are also shown.

In 1985, a total of 39,801 boating parties were interviewed at 31 landing locations in the Strait of Georgia creel survey area. The 33,494 fishing interviews conducted represents approximately $5 \%$ of the total number of boat trips conducted by sport fishermen in the Strait of Georgia in 1985. A total of 69 overflights were also conducted to take "snapshot" counts of fishing effort.

In 1985, sport fishermen made an estimated 628,513 boat trips in the Strait of Georgia and landed an estimated total finfish catch of 1,337,000 pieces of which $79 \%$ were salmon and $21 \%$ were groundfish. The $1,063,000$ landed salmon consisted of 728,000 coho, 235,000 chinook, 91,000 pink salmon and 8,000 combined chum and sockeye. An additional 703,000 salmon of mixed species were released by anglers.

The 274,000 landed groundfish consisted of 134,000 rockfish, 77,000 lingcod, 5,000 dogfish and 59,000 other finfish. Rockfish catches were identified as quillback ( $39 \%$ of rockfish catch) , copper ( $16 \%$ ), yelloweye ( $10 \%$ ), and black ( $1 \%$ ); the remaining $34 \%$ of the rockfish catch consisted of tiger, yellowtail, china, canary and unidentified species.

Catch success per boat trip averaged 1.7 salmon (all species) and 0.4 groundfish.

Among salmon examined for marks, $1.9 \%$ of chinook and $5.9 \%$ of coho had adipose fin clips. The majority of chinook sport catch in 1985 consisted of age 3 fish ( $70.8 \%$ ), followed by age 4 ( $20.6 \%$ ), age $2(6.6 \%$ ) and age 5 or older ( $2.0 \%$ ). Of the total chinook measured in 1985 , $2 \%$ were sub-legal in size (less than 45 cm ).

### 5.0 ACKNOWLEDGMENTS

The authors wish to thank Tom Hoyt for his contribution to program management. We acknowledge the creel survey staff of DPA Consulting ltd., particularly Gordon Gislason, Geoferey Ziess and Susan Hamilton, for their valuable constribution to creel survey operations and data collection and assembly. We are grateful to private marina and boat ramp owners for their valuable assistance and cooperation as well as to the thousands of anglers who participated in the survey. We also thank Carmen McConnell and Brenda Hoitsma for assistance in preparation of tables and figures, Alice Fedorenko for editing the report and preparing it for publication, and the DFO Word Processing Unit for typing the drafts.

+ Includes sockeye and chum salmon.
* A total closure for lingcod was in effect from January 1 to April 15 , and November 15 to December 31. Reported figures most likely represent illegal catches by anglers.
** In addition, an estimated 339 steelhead, cuthroat trout and unidentified salmon were caught by sport fishermen.

## APPENDIX A

METHODS AND EQUATIONS USED IN ANALYSIS OF CATCH AND EFFORT STATISTICS FOR THE STRAIT OF GEORGIA SPORT FISHERY CREEL SURVEYS, 1983-19851.

## ${ }^{1}$ Adapted from:

Shardlow, T. F., K. K. English, T. Hoyt, G. E. Gillespie and T. A. Calvin. 1989. Strait of Georgia Creel Survey sport fishery statistics, 1983. Can. MS Rep. Fish. Aquat. Sci. 1872 : 53 p.

METHODS AND EQUATIONS USED IN ANALYSIS OF CATCH AND EFFORT STATISTICS FOR THE STRAIT OF GEORGIA SPORT FISHERY CREEL SURVEYS, 1983 - 1985.

The description of terms, variables and subscripts used in the data analysis is given in Table A-1.

## Calculation of Catch and Effort Statistics

To estimate the monthly catch and effort, three components had to be calculated from that month's data:
(1) the weighted mean daily fishing pattern from interview data, (2) the weighted mean catch per unit effort from interview data and
(3) the mean sport count from overflight data.

The equations used to estimate the means and variances for all catch and effort statistics are shown below. For April which had only overflight data, the interview data from preceding and following months were combined to estimate the mean daily fishing activity pattern and catch per unit effort. The catch and effort estimates for April are referred to as indirect estimates.

Weighting factors used to estimate the daily fishing activity pattern and mean catch per unit effort were calculated using the equations derived from DPA Consulting Ltd. (1982).

The data obtained from each shift were multiplied by the following weighting factor (W1) to expand for all possible stints at each site. The formula reads:

$$
\begin{equation*}
W 1_{\mathrm{dij}}=\frac{N_{\mathrm{d}}}{\mathrm{n}_{\mathrm{dij}}} \tag{1}
\end{equation*}
$$

where $N_{d}$ is the total number of days of type $d$ in that month and $n_{d i j}$ is the number of times the $j$ th work block at the ith site was sampled on type d days.

The interviews aggregrated by work block were multiplied by the weighting factor $W$ 2 to expand for all boats that landed in each work block. The formula reads:

$$
\begin{equation*}
W 2_{\text {dijk }}=\frac{L_{\text {dijk }}}{I_{\text {dijk }}} \tag{2}
\end{equation*}
$$

where $L_{d i j k}$ is the number of boats landed and $I_{\text {dijk }}$ is the number of boats interviewed on the kth stint in the jth work block at the ith site on a day type d.

Therefore, the following equations can be used to calculate an unbiased estimate of the total monthly catch ( $\hat{\mathrm{C}}_{\mathrm{dgr}}$ ), fishing trips ( $\hat{T}_{\mathrm{dg}}$ ) and fishing activity in time block $\widehat{A}_{d g t}$ for each day type (d) where $g$ is a set of landing sites (i). These formulas read:

Table A-1. Description of terms, variables and subscripts used in this report.

DESCRIPTION OF TERMS
Shift/Stint - Represents a combination of a day type and landing site which was sampled on a single day. i.e. one sampling stint performed by an interviewer.

Work

- Represents one of four possible periods at a particular site of a given day type.

Work Block 1 is before 11 AM Work Block 2 is 11 AM - 3 PM Work Block 3 is 3 PM - 7 PM Work Block 4 is after 7 PM

Day type - There are two possible day types: weekdays and weekends; holidays are considered to be weekend days.

DESCRIPTION OF VARIABLES

- Number of boats actively fishing
- Number of boats observed on a fight
- Catch
- Catch of marked salmon
- Catch per boat trip
- Effort (estimated total number of boat trips)
- Number of boats interviewed and found to have been fishing
- Number of boats landing
- Number sampled
- Population size from which n samples were observed
- Proportion
- Number of boat trips
- Number found to be marked
- Weighting factor to expand for all possible stints at each site
- Weighting factor to expand for all boats that landed in each work block

DESCRIPTION OF SUBSCRIPTS

```
- age
- a set of landing sites
- day type
- site
- work block
- stint
- landing time block
- month
- the next boat landing at site i and upon interviewing, found to have
        been fishing(q ranges from l to n)
- species
- sub-Statistical Area
- time block
- flight
- region
- annual
```

$$
\begin{align*}
& \hat{\mathrm{C}}_{\text {dgr }}=\sum_{\mathrm{i}} \sum_{\mathrm{j}}\left[\mathrm{~W}^{1} \sum_{\text {dij }} \sum_{\mathrm{k}} \sum_{\mathrm{q}}\left({ }^{W}{ }^{2} \text { dijk }^{\mathrm{C}_{\text {dijklqr }}}\right)\right]  \tag{3}\\
& \hat{T}_{d g}=\sum_{i} \sum_{j}\left[W_{d i j} \sum_{k} \sum_{q}\left(W 2_{d i j k}\right)\right]  \tag{4}\\
& \hat{A}_{d g t}=\sum_{i} \sum_{j}\left[W_{d i j} \sum_{k} \sum_{q}\left(W_{d i j k} A_{\text {dijkqt }}\right)\right] \tag{5}
\end{align*}
$$

where $C_{\text {dijkgr }}$ is the catch of species $r$ by the qth fishing party, and $A_{d i j k q t}$ can equal or 1 , thereby indicating whether the qth fishing party was actively fishing in time block $t$. Thus, the mean monthly catch per unit effort ( CPE $_{\mathrm{dgr}}$ ) measured in terms of numbers of fish kept per completed boat trip, and proportion of daily fishing effort active during the hour of the aerial survey ( $\mathrm{P}_{\mathrm{dg}}$ ) can be calculated with the following equations:

$$
\begin{align*}
& \text { CPE }_{\mathrm{dgr}}=\frac{\hat{\mathrm{C}}_{\mathrm{dgr}}}{\hat{\mathrm{~T}}_{\mathrm{dg}}}  \tag{6}\\
& \mathrm{P}_{\mathrm{dgt}}=\frac{\hat{\mathrm{A}}_{\mathrm{dgt}}}{\hat{\mathrm{~T}}_{\mathrm{dg}}} \tag{7}
\end{align*}
$$

where CPE $_{\text {dgr }}$ and $P_{\text {dgt }}$ are calculated for each day type (d) and group of landing sites (g). The groups of landing sites reflect geographic areas with similar catch rates and/or activity patterns.

The estimated mean number of boats fishing during the hour of the sport boat count by overflight was calculated for each sub-Statistical Area using the following equation:

$$
\begin{equation*}
\overline{\mathrm{B}}_{\mathrm{dst}}=\frac{\sum_{\mathrm{u}}^{\mathrm{B}} \mathrm{~B}_{\mathrm{dstu}}}{\mathrm{n}_{\mathrm{ds}}} \tag{8}
\end{equation*}
$$

where $\mathrm{B}_{\mathrm{d} s t u}$ is the number of boats observed fishing on flight u at time t , in sub-Statistical Area s for day type d.

The mean sport boat count at the time of the overflight ( $\bar{B}_{\mathrm{d}}^{\mathrm{ft}}$ ) and proportion of daily fishing effort active during the hour of the overflight ( $P_{\text {dgt }}$ ) were used in the following equation to calculate the total fishing effort for sub-Statistical Area $s$ on day type d:

$$
\begin{equation*}
\mathrm{E}_{\mathrm{ds}}=\overline{\mathrm{B}} \mathrm{dst}_{\mathrm{dgt}} \overline{\mathrm{P}}_{\mathrm{d}} \tag{9}
\end{equation*}
$$

where $N_{d}$ is the number of type d days in the month. Interview data for the sub-Statistical Areas fished (s) by anglers landing at each of the sites (i) within a landing group ( $g$ ) were used to select the proportions ( $P_{d g t}$ ) that are appropriate for each mean boat count ( $\bar{B}_{\mathrm{d} s t}$ ).

The estimate for total effort by sub-Statistical Area and day type ( $E_{d s}$ ) and the weighted carch per boat trip for a group of landing sites by day type, area and species ( $C P E_{d g r}$ ) were used to calculate total catch for each species ( $r$ ) and each sub-Statistical Area (s).

$$
\begin{equation*}
C_{s r}=\sum_{d}\left(E_{d s} C_{d g r}\right) \tag{10}
\end{equation*}
$$

The interview data were also used to select the catch per effort estimates ( $C_{E E} g_{g}$ ) that should be applied to the effort estimate ( $\mathrm{E}_{\mathrm{ds}}$ ) for a specific sub-Statistical Area (s).

## Variance of Total Fishing Effort

The variance for estimates of cotal fishing effort has two components:
(1) the variance in aerial sport boat counts:

$$
\begin{equation*}
S_{B_{d s t}}^{2}=\frac{\sum_{u} B_{d s t u}^{2}-\frac{\left(\sum_{u} B_{d s t u}\right)^{2}}{n_{d s}}}{n_{d s}\left(n_{d s}-1\right)}\left[\frac{N_{d}-n_{d s}}{N_{d}-1}\right] \tag{11}
\end{equation*}
$$

where $B_{d s t u}$ is the aerial sport boat count at time $t$ during an aerial survey $u$ on a type d day in sub-area $s ; n_{d s}$ is the number of aerial surveys in which boats were counted on type d days, in sub-Statistical Area $s$; and $N_{d}$ is the total number of type d days in the month.
(2) the variance in the proportion of boats fishing during the hours of the aerial boat counts:

$$
\begin{equation*}
S_{P_{d g t}}^{2}=\frac{P_{d g t}\left(1-P_{d g t}\right)}{I_{d g}} \tag{12}
\end{equation*}
$$

where $\mathrm{P}_{\mathrm{dg}} \mathrm{t}$ is the mean proportion of boats fishing for a group of landing sites $g$ during the hour of the aerial boat count $t$ on type d days, and $I_{d g}$ is the total number of sport fishing boats interviewed. The above formula assumes $P_{d g t}$ is unbiased and normally distributed where the number of interviews is large.

The variances for boat counts ( $\mathrm{S}^{2}{ }_{\mathrm{B}_{\mathrm{dst}}}$ ) and proportion of boats fishing ( $\mathrm{S}^{2} \mathrm{P}_{\mathrm{dgt}}$ ) were combined in the following equation to calculate variance for effort:

$$
\begin{equation*}
S_{E_{d s}}^{2}=N_{d}^{2}\left(\frac{B_{d s t}^{2}}{P_{d g t}^{2}}\right)\left(\frac{S_{B_{d s t}}^{2}}{B_{d s t}^{2}}+\frac{S_{P_{d g t}}^{2}}{P_{d g t}^{2}}\right) \tag{13}
\end{equation*}
$$

where $S^{2} E_{d s}$ is the variance for total effort on type d days in sub-area $s$, and the formula is the standard formula for the variance of a ratio of two independent random variables.

## Variance of Total Catch

The variance for estimates of total catch had two components: (1) the variance for total effort (presented above), and (2) the variance for catch per boat trip.

The variance for catch per boat trip $\left(\mathrm{S}^{2} \mathrm{CPE}_{\mathrm{dgr}}\right)$ was calculated using the following equation:

$$
\begin{equation*}
\mathrm{S}_{\mathrm{CPE}_{\mathrm{dgr}}}^{2}=\frac{\mathrm{SS}_{\mathrm{CPE}_{\mathrm{dgr}}}-\frac{\left(\mathrm{S}_{\mathrm{CPE}_{\mathrm{dgr}}}\right)^{2}}{\mathrm{I}_{\mathrm{dg}}}}{\mathrm{I}_{\mathrm{dg}}\left(\mathrm{I}_{\mathrm{dg}}-1\right)} \tag{14}
\end{equation*}
$$

where $S_{S_{C P E}^{d g r}}$ is the weighted sum of squares for $C P E_{d g r}$, and $S_{C_{C P E}}$ dgr is the weighted sum for $\mathrm{CPE}_{\mathrm{dgr}}$, such that the sum of the weighting factors used to estimate $C^{\text {CPE }}{ }_{d g r}$ was equal to the number of interviewed boat trips ( $I_{d g}$ ).

The variance for total effort and the variance in the catch per boat trip for the appropriately grouped landing sites were combined in the following equation to calculate variance for total catch:

$$
\begin{equation*}
S_{C_{s T}}^{2}=\sum_{d}\left(E_{d s}^{2} S_{C P E_{d g r}}^{2}+\operatorname{CPE}_{d g r}^{2} S_{E_{d s}}^{2}+S_{C P E}^{2} S_{d g r}^{2}\right) \tag{15}
\end{equation*}
$$

which is che standard formula for the variance of the product of two independent random variables, and where $S^{2} C_{s r}$ is the variance for total number of species $r$ in sub-Statistical Area $s$.

## Estimation of Marked Chinook and Coho Salmon

Incidence of marked (adipose-clipped) chinook and coho was recorded in each interview. The proportion of marks observed for each region, month and species ( $\mathrm{P}_{\mathrm{xmr}}$ ) was calculated as:

$$
\begin{equation*}
P_{x m r}=\frac{V_{x m r}}{n_{x m r}} \tag{16}
\end{equation*}
$$

where $V$ is the number of marked fish observed and $n$ is the number of fish inspected by region( $x$ ), month(m) and species (r).

The variance of each proportion was calculated as:

$$
\begin{equation*}
\mathrm{S}_{\mathrm{P}_{\mathrm{xmr}}}^{2}=\frac{\mathrm{P}_{\mathrm{xmr}}\left(1-\mathrm{P}_{\mathrm{xmr}}\right)}{\mathrm{n}_{\mathrm{xmr}}} \tag{17}
\end{equation*}
$$

Monthly catch estimates of marked salmon were calculated as:

$$
\begin{equation*}
\mathrm{C}_{\mathrm{xmr}}^{\prime}=\mathrm{P}_{\mathrm{xmr}} \mathrm{C}_{\mathrm{xmr}} \tag{18}
\end{equation*}
$$

where $C_{x m r}$ is the estimated catch of species $r$ in region $x$ and month $m$. The variance of the marked catch estimates was calculated as:

$$
\begin{equation*}
S_{C_{x m r}^{\prime}}^{2}=P_{x m r}^{2} S_{C_{x m r}}^{2}+C_{x m r}^{2} S_{P_{x m r}}^{2}+S_{C_{x m r}}^{2} S_{P_{x m r}}^{2} \tag{19}
\end{equation*}
$$

where $S^{2} C_{x m r}$ is the variance of the catch estimate of species $r$ in region $x$ and month $m$.

The estimated annual proportions of marked salmon caught in each region (weighted by the corresponding regional annual catch estimates) were calculated as:

$$
\begin{equation*}
P_{x r y}=\frac{C_{x r y}}{C_{x r y}} \tag{20}
\end{equation*}
$$

where

$$
\begin{equation*}
C_{x r y}^{\prime}=\sum_{m} C_{x m r} \quad \text { and } \quad C_{x r y}=\sum_{m} C_{x m r} \tag{21}
\end{equation*}
$$

The variance of the annual proportions was calculated as:

$$
\begin{equation*}
S_{P_{x r y}}^{2}=\left(\frac{C_{x r y}^{\prime}}{C_{x r y}}\right)^{2}\left[\frac{S_{C_{x r y}^{\prime}}^{2}}{\left(C_{x r y}^{\prime}\right)^{2}}+\frac{S_{C_{x r y}}^{2}}{\left(C_{x r y}\right)^{2}}\right] \tag{22}
\end{equation*}
$$

where $S^{2} C_{x r y}$ is the variance of the annual estimated catch of species $r$ in region $x$.

Estimation of Age Composition of Chinook Catch

Scale samples and length measurements were taken in a subsampling program during the interview process. Ages used in this report represent total age of the fish (including both freshwater and oceanic life) according to the Gilbert-Rich (1927) recording convention.

The proportion of chinook at each age and month ( $\mathrm{P}_{\mathrm{am}}$ ) was calculated as:

$$
\begin{equation*}
P_{a m}=\frac{a_{m}}{n_{m}} \tag{23}
\end{equation*}
$$

where $a_{m}$ represents the number of fish observed at age a during month $m$, and $n_{m}$ is the total number of fish biosampled in that month.

The variance of each proportion was calculated as:

$$
\begin{equation*}
S_{a m}^{2}=\frac{P_{a m}\left(1-P_{a m}\right)}{n_{m}} \tag{24}
\end{equation*}
$$

The catch at age of chinook in each month was calculated as:

$$
\begin{equation*}
\mathrm{C}_{\mathrm{am}}=\mathrm{P}_{\mathrm{am}} \mathrm{C}_{\mathrm{m}} \tag{25}
\end{equation*}
$$

where $C_{r n}$ is the estimated catch of chinook salmon in a given month $m$. The variance of the catch at age estimate was calculated as:

$$
\begin{equation*}
S_{C_{a m}}^{2}=P_{a m}^{2} S_{C_{m}}^{2}+C_{m}^{2} S_{P_{a m}}^{2}+S_{C_{m}}^{2} S_{P_{a m}}^{2} \tag{26}
\end{equation*}
$$

where $S^{2} C_{m}$ is the variance of the monthly catch estimate $C_{m}$. The annual catch at age was calculated as:

$$
\begin{equation*}
C_{a y}=\sum_{m} C_{a m} \tag{27}
\end{equation*}
$$

with a variance

$$
\begin{equation*}
S_{C_{a y}}^{2}=\sum_{m} S_{C_{a m}}^{2} \tag{28}
\end{equation*}
$$

The annual proportion at age (weighted by monthly catch) was calculated as:

$$
\begin{equation*}
P_{a y}=\frac{C_{a y}}{C_{y}} \tag{29}
\end{equation*}
$$

with a variance

$$
\begin{equation*}
S_{P_{a y}}^{2}=\left(\frac{C_{a y}}{C_{y}}\right)^{2}\left[\frac{S_{C_{a y}}^{2}}{\left(C_{a y}\right)^{2}}+\frac{S_{C_{y}}^{2}}{\left(C_{y}\right)^{2}}\right] \tag{30}
\end{equation*}
$$

APPENDIX B
CATCH AND EFFORT STATISTICS BY MONTH AND STATISTICAL AREAFOR STRAIT OF GEORGIA, 1985 .

APPENDIX B-1. STRAIT OF GEORGIA FISHING EFFORT (NO. BOAT TRIPS), 1985.

| Month |  | Statistical Area |  |  |  |  |  |  |  |  |  | Total |

APPENDIX C̄. STRAIT OF GEORGIA CREEL SURVEY STUDY AREA.

The Strait of Georgia Creel Survey study area includes those waters of Juan de Euca Strait and the Strait of Georgia bounded in the south by a line from Sheringham pt. on Vancouver Island due south to an intersection with the International Boundary and along the International Boundary to the B.C. Mainland coast at Blaine (Boundary Bay) and in the north by the following 3 boundary lines:

1) in discovery passage from Granite Pt. on Quadra Island to the stream mouth west of Moriarity Pt. on Vancouver Island.
2) In Okisollo Channel from Granite Pt. on Quadra Island due north to Sonora Island.
3) in Cordero Channel from Burnt Bluff on the mainland $214^{\circ}$ passing west of Dent Island to Sonora Island.

The area for which the Strait of Georgia Creel Survey statistics apply includes the above listed administrative area with the exception of the following areas:

1) Bute Inlet above a line from Lawrence Pt. running across the inlet. This area coincides with management units 13-21 and 13-22.
2) Waters of Pryce Channel, Waddington Channel, Pendrell Sound, Homfray Channel and Toba Inlet bounded by a line drawn from Horace Head on East Redonda Island at the south end of Waddington Channel to the northern point of Roscoe Bay on West Redonda Island and a line drawn within Homfray Channel from Price Pt. on the eastern shore of the channel by a line drawn from George Head at the easterly entrance of Ramsay Arm to Sutil Pt. on Cortes Island.
3) Hotham Sound above a line drawn from Elephant Point on the western shore of the Sound to the southern point of Granville Bay on the eastern shore of the Sound.
4) Jervis Inlet above a line drawn within Prince of whales Reach from the mouth of Treat Creek on the east shore across the Reach to the summit (1625') at the head of Goliath Bay.
5) Sechelt Inlet including Narrows Inlet and Salmon Inlet above a line drawn within Skookumchuck Narrows from the "dog-leg" point southeast of the Egmont Pt. $224^{\circ}$ across the Narrows to Sechelt Peninsula.

APPENDIX D. SPECIES COMMONLY INCLUDED WITH OTHER FINFISH.

```
Pacific Herring
Pacific Cod
Pacific Tomcod
Walleye Pollock
Pacific Hake
Perches - any perch, seaperch or surfperch
Greenlings
Flounders - Pacific Halibut, any flounder or sole
```

[^0]:    * Obs - marks observed.
    ** Insp - fish inspected.

[^1]:    * Calculated using data from Table 8 and Appendix B-3.

[^2]:    * Calculated using data from Table 9 and Appendix B-2.

[^3]:    * Includes chum and sockeye.

[^4]:    * Includes coho, chinook, pink, chum, sockeye, steelhead and cutthroat trout.

[^5]:    * A total closure for lingcod was in effect from January 1 to April 15, and November 15 to December 31, 1985; see Table 3 footnote.
