## Canadian Technical Report of Fisheries and Aquatic Sciences

Technteal reports contain sctentific and tectrnical information that contributes to existing knowledge but which is not normally appropriate for primary literature. Technical reports are directed primarily foward a worldwide audience and have an international distribution. No restriction is placed on subject matter and the series fellents the broad interests and policies of the Department of Fisheries and Oceans. namely. Iisheries and aquatic sciences.

Technical reports may be cited as full publications. The correct ettation appears above the abstract of each repori. Each report is abstracted in Aquaru Siventes and Fisheries fhestracs and indexed in the Department's annual index to scientific and technical publications.

Numbers 1456 in this series were issued as Technical Reports of the Fisheries Research. Board of Canada. Numbers $457-714$ were issued as Department of the Environment, Fisheries and Marine Service, Research and Development Directorate Teehmeal Reporis. Numbers 715424 were issued as Department of Fisheries and the Ensironment. Fisheries and Marine Service Technical Reports. The eurrent series name was changed with report number 925

Technical reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuingestablishment listed on the front eover and title page Out-ol-stock reports will be supplied for a fee by commercial agents.

## Rapport technique canadien des sciences halieutiques et aquatiques

I es rapports techniques contiennent des renseignements setentifiques et techmques qui constituent une contribution aus connaissances actuelles, mais qui ne sont pas normalement appropries pour la publication dans un journal scientifque. Les rapports techniques sont destines essentiellement at un public international et ils sont distribués à cet echelon. It n'y a aucune restriction quant au sujet: de fait, la serie reflete la vaste gamme des intérêls el des politiques du ministere des Péches et des Océans. cest-ï-dire les sciences halieutiques et aquatiques.

Les rapporls techniques peuvent être cités comme des publications complètes. I.e ture exact paraut au-dessus duresume de chaque rapport, Les rapports techniques sont resumes dans lat revue Resumes des setomes atrathitues et hatiewtiques, et ils sont classés dans lindex annual des publications sciemifiques et techniques du Ministère.

Les numeros l ì 456 de cette sétic ont été publiés à titre de rapports techniques de roffice des recherehes sur les peeheries du Canada. Les numéros 457 à 714 sont parus à titre de rapports techniques de la Direction genérale de la recherehe et du développement. Sersice des pêches et de la mer, ministêre de l'EnvironnemenL. Les numẽros 715 ä 924 ont été publiés à titre de rapports techniques du Service des pêches et de la mer, ministère des Peches et de l'Environnement. Le nom actuel de la séric a été établi lors de la parution du numéro 925

Les rapports techniques sont produts à léchelon régional, mais numérotés à Feechelon national. Les demandes de rapports seront satisfates par T'établissement auteur dont le nom Cigure sur la couverture et la page da titre. Les rapports épuisés seront fournis contre rétribution par des agents commerciaux.

Between 1940 and 1977, numerous tagging studies on adult Atlantic salmon (Salmo salar) were carried out to learn more about the migration patterns and origins of stocks in the coastal waters of Newfoundland and Labrador and in the Labrador Sea. This paper provides a summary for each tagging site of the number of salmon tagged and recaptured. A brief description is given of the composition of stocks exploited by the Newfoundland and Labrador commercial fishery, the utilization of these stocks, and general migration patterns. In total, 3495 salmon of various sea ages have been tagged and released and there have been 892 ( $26 \%$ ) reported recaptures. Recaptures occurred in commercial and recreational fisheries in Newfoundland and Labrador, New Brunswick, Nova Scotia, Quebec, Greenland, Ireland and Scotland.

## RÉSUMÉ

Reddin, D. G., and W. H. Lear. 1990. Summary of marine tagging studies of Atlantic salmon (Salmo salar L.) in the Northwest Atlantic area. Can. Tech. Rep. Fish. Aquat. Sci. 1737: iv + 115 p.

Entre 1940 et 1977, on a réalisé de nombreuses études de marquage sur des saumons de l'Atlantique (Salmo salar) adultes, dans le but de mieux connaitre les habitudes migratoires et l'origine des stocks évoluant dans les eaux côtières de Terra-Neuve et du Labrador ainsi que dans la mer du Labrador. Le présent document brosse un tableau du nombre de saumons étiquetés et recapturés, par site d'étiquetage. De plus, il décrit brièvement la composition des stocks exploités par les pêcheurs commerciaux de Terra-Neuve et du Labrador, l'utilisation de ces storks et leurs habitudes migratoires générales. En tout, on a étiqueté et remis à l'eau 3495 saumons à divers stades de leur phase en mer. Le nombre de recaptures déclarées a été de 892, soit 26 p. 100. Les saumons en question ont été repris par des pêcheurs commerciaux et par des pêcheurs sportifs de Terre-Neuve et du Labrador, du Nouveau-Brunswick, de Nouvelle-Écosse, du Québec, du Groenland, d'Irlande et d'Écosse.

## INTRODUCTION

Atlantic salmon (Salmo salar L.) populations are found in many rivers throughout insular Newfoundland and in Labrador north to Anaktalik Brook at $56^{\circ} 29^{\prime} \mathrm{N} 62^{\circ} 09^{\prime} \mathrm{W}$ (Anderson 1985). In 1987, there were 173 rivers in Schedule II of the Newfoundland Fisheries Regulations identified as salmon rivers (scheduled rivers) out of a total of 310 rivers. Many rivers, particularly in Labrador, contain salmon populations but are not scheduled rivers. Historical records indicate that the coastal fisheries began for salmon in the mid to late 1800 s (Taylor 1985). Landings in the commercial fishery peaked in 1930 at 8920 t and more recently, average landings from 1971 to 1987 were 1522 t (Anon. 1988). Historically, salmon catches in Newfoundland and Labrador have constituted a large proportion of the total Canadian landings. Mean Canadian landings from 1971 to 1987 were 1939 t (Anon. 1988), of which the Newfoundland and Labrador portion is $78 \%$.

As early as the 1930s, it was recognized that at least some of the Newfoundland and Labrador coastal fisheries were harvesting salmon distant from their rivers of origin (Belding 1939). Murray (1968) demonstrated that salmon originating in the Little Codroy River on the southwest coast of Newfoundland were widely distributed around the island. Results of a smolt tagging study on the Sand Hill River, Labrador indicated that, in addition to being caught in Labrador, salmon originating from this river were also caught in Newfoundland (Pratt et al. 1974). Subsequent studies have shown that in addition to Newfoundland and Labrador origin salmon, some salmon from stocks in the USA, Nova Scotia, New Brunswick, and Quebec frequent, in varying proportions, the waters off Newfoundland and Labrador (Murray 1966; Pippy 1982; Anon. 1988). A subsequent analysis, based on tag releases during the period 1968-73 and average catch distribution for $1969-75$, showed that $24 \%$ of the total salmon caught in the Newfoundland and Labrador fishery originated from mainland Canada (Pippy 1982).

Beginning in 1940, the Newfoundland Commission of Government (1940-49), and since 1949 the Canadian Department of Fisheries and Oceans and its predecessors (1949 to present), have conducted in excess of 50 investigations involving the tagging of adult salmon in the coastal waters of Newfoundland and Labrador and in the Labrador Sea. While the objectives of these investigations have been numerous, they can generally be grouped into three main ones, namely: 1) to determine the stock composition of populations exploited in various coastal areas; 2) to determine utilization of these stocks; and 3) to determine distribution, feeding areas and migration patterns. The results of many of these studies are not available in the literature, yet they provide useful information for understanding the marine life of Atlantic salmon and the dynamics of the Newfoundland and Labrador commercial fisheries (Blair 1956; Blair 1957a and b). This report summarizes the results of tagging projects conducted in the coastal waters of Newfoundland and Labrador and the Labrador Sea from 1940 to 1977. Also some general observations are made on stock composition of the fisheries, utilization of stocks, and migration patterns.

## METHODS

During the period from 1940 to 1977 , adult salmon were tagged at 27 sites in the coastal waters of Newfoundland, 13 sites in Labrador, and 12 sites in the Labrador Sea area of the Northwest Atlantic Ocean (Fig. 1). Tagging sites are numbered in geographical order beginning on the west coast of Newfoundland and continuing counter-clockwise around the island and then northwards along the coast of Labrador (Fig. 1). Longitudes and latitudes are provided for those tagging experiments where gear was set out at several locations. In the figures, the tagging site is identified with an open circle containing the number of salmon tagged and released (Fig. 2-39). Other symbols on the figures identify the location of recapture, the sea ages, and the number of years that the recapture occurred after tagging. In the tables the symbol S refers to recapture in the sea and R refers to a recapture in a river.

## FISHING GEAR

Over the years a variety of research vessels both chartered and government owned were used, ranging in size from small open boats to large offshore vessels. Different types of fishing gear were used including nets constructed of cotton and nylon multifilament and nylon monofilament twine of mesh sizes ranging from 114 mm to 160 mm length of mesh opening. Trap nets of various types and materials have also been used. These gears have been set fastened to the shore and allowed to drift. Baltic longlines, set in the upper 10 m near the surface of the water, were also used on occasion.

## TAGGING TECHNIQUES

Since the 1940s a variety of tagging techniques have been used. The type of tag and method of attachment is provided in the Tables in addition to the results of each tagging project. The following description provides general information on the technique most frequently used. Salmon were removed from the nets by cutting mesh with scissors, released into a small tank in the tagging boat, and held for a short recovery period prior to tagging. The tag was applied by inserting a double hollow needle through the dorsal musculature just below the anterior base of the dorsal fin; wires were then inserted into the needles, needles removed, and wires pulled tight and twisted leaving enough free wire for growth. The tag usually was placed so that it hung from the left side of the fish. The type of tag most commonly used was a Carlin tag $15 \mathrm{~mm} \times 5 \mathrm{~mm} \times 0.8 \mathrm{~mm}$ and wired with a 0.3 mm stainless steel wire. 0ther types of tags, sizes of tags, and methods of attachment were also used. The return address was on one side of the tag and a notice of reward and tag number were on the other side. Posters notifying fishermen of the reward were placed in Post offices throughout Newfoundland and Labrador.

Tagged fish were sampled for fork length (nearest cm) and in recent years scale samples were removed from the left side of the fish from three to six scale rows above the lateral line on a line extending from the posterior edge of the base of the dorsal fin to the anterior edge of the anal fin. Impressions of the scales were made on plastic slides and from these impressions, the freshwater and sea ages were determined. The terminology used to describe life-history stages of Atlantic salmon in this report is that
recommended by Allan and Ritter (1977). The stages are: 1-sea-winter (1SW), 2-sea-winter (2SW), 3-sea-winter (3SW), and multi-sea-winter (MSW) salmon that had previously spawned (PS).

RESULTS AND DISCUSSIONS

WEST COAST

Site 1. St. George's Bay, 1976
In St. George's Bay in 1976, a single 2 SW salmon was tagged and released. This salmon was subsequently recaptured in St. George's Bay (Table 1, Fig. 2). The river age of this salmon was three years.

SOUTH COAST

Site 2. Port aux Basques, 1969
Near Port aux Basques in 1969, there were 250 salmon tagged and released (Table 2). The tagging sites ranged from 4 to 8 nautical miles offshore. Of the salmon tagged and released, 106 ( $42 \%$ ) were recaptured. Two out of three ( $67 \%$ ) recaptures of 1 SW salmon and 22 out of $83(27 \%) 2$ SW salmon recaptures were in Newfoundland. Salmon of other sea-age classes were recaptured mainly in the Maritime Provinces and Quebec (Fig. 3). The river ages of the tagged fish were mainly three and four years with mean river ages ranging from 3.0 years for previously spawned salmon to 3.3 years for 2 SW salmon.

Site 3. Port aux Basques, 1976
Near Port aux Basques in 1976, there were 214 salmon tagged and released (Table 3). The tagging sites ranged from nearshore to 5 nautical miles offshore. Of the salmon tagged and released, 35 ( $16 \%$ ) were recaptured. Three out of four ( $75 \%$ ) 1SW salmon were recaptured in Newfoundland and two out of 28 ( $7 \%$ ) 2 SW salmon were recaptured in Newfoundland. One of the 2 SW salmon was recaptured to the east of the tagging site (Fig. 4). Three of 12 ( $25 \%$ ) salmon of other sea ages tagged and released were recaptured in the Maritime Provinces and Quebec. The river ages of the tagged salmon were mainly two, three, and four years with a mode of three years.

Site 4. Burgeo Bank, 1977
On Burgeo Bank in 1977, there were four salmon tagged of which there were no recaptures. The river ages of these salmon ranged from two to four years (Table 4).

In Fortune Bay in 1976, there were 39 salmon tagged and released (Table 5). Of these, three ( $8 \%$ ) were recaptured, two in Fortune Bay and the other in the Maritimes (Fig. 5). The mean river age of the 1 SW salmon was 3.1 years.

Site 6. Fortune Bay, 1977
In Fortune Bay in 1977, there were 51 salmon including one $0+$ post-smolt tagged and released (Table 6). Of these, 12 ( $24 \%$ ) have been recaptured, all of them in Fortune Bay (Fig. 6). The mean river age of the 1 SW salmon was 3.2 years and 3.3 years for the previous spawners.

Site 7. Point Crewe, 1973
Near Point Crewe in 1973, a single 2 SW salmon was tagged and released and subsequently recaptured in the sea in Newfoundland (Table 7). The river age of this salmon was 2.0 years.

Site 8. St. Lawrence, 1973
Near St. Lawrence in 1973, there were 129 1SW and MSW salmon tagged and released (Table 8). Of these, 32 ( $25 \%$ ) were recaptured, most of them well away from the tagging site near St. Lawrence (Fig. 7). Two of the four 1SW salmon recaptured were caught in Newfoundland (Fig. 7). Of the 252 SW salmon recaptured, 12 ( $48 \%$ ) were caught in Newfoundland. Most of the 2 SW recaptures in Newfoundland were caught in the area from Burgeo to Port aux Basques. The mean river ages of the tagged salmon ranged from 2.3 for 1 SW salmon to 3.0 years for 2 SW salmon.

Site 9. Placentia Bay, 1975
In Placentia Bay in 1975, 452 salmon were tagged and released (Table 9). Of these, 103 (23\%) have been recaptured, most of them in Newfoundland (Fig. 8). Most of the salmon tagged and released were 1SW in age and, of these, 93 were recaptured but only three ( $3 \%$ ) were recaptured outside of Newfoundland. Although most of the recaptures occurred in Placentia Bay, there were recaptures to the west of the tagging site almost to Burgeo and as far east as St. Mary's Bay and along the northeast coast as far north as St. Anthony. A single 1 SW salmon was recaptured in a river on the northwest coast. Out of the 102 SW salmon recaptured, only one was caught outside of Newfoundland. Mean river age ranged from 2.2 years for previous spawners to 2.9 years for 1 SW salmon.

Site 10. Cape Pine, 1973
Near Cape Pine in 1973, six salmon were tagged and released (Table 10). Of these, three (50\%) have been recaptured, none of them in the area of tagging (Fig. 9). The mean river age of the tagged fish was 2.3 years.

EAST COAST

Site 11. Renews, 1973
Near Renews in 1973, 67 salmon were tagged and released (Table 11). Of these, 16 ( $24 \%$ ) have been recaptured, nine of them in Newfoundland. Out of 36 1SW salmon tagged and released, 11 ( $31 \%$ ) have been recaptured, eight in Newfoundland and three in the Maritimes. Of the 302 SW salmon tagged and released, five (17\%) were recaptured, one in Newfoundland, two in the Maritimes and two in Quebec (Fig. 10). The mean river ages of the tagged salmon ranged from 2.9 years for 2 SW salmon to 3.0 years for 1 SW salmon.

Site 12. Cape Broyle, 1949
Near Cape Broyle in 1949, 63 salmon were tagged and released (Table 12). Of these, eight 2 SW salmon were recaptured. Two of the eight ( $25 \%$ ) recaptures occurred in the Maritimes (Fig. 11). The mean river ages of the tagged salmon were unavailable.

Site 13. Conception Bay, 1974
In Conception Bay in 1974, 160 salmon were tagged and released (Table 13). Of these, 46 ( $29 \%$ ) were recaptured, 35 of them in Newfoundland. Out of 23 1SW salmon tagged and released, eight (35\%) were recaptured, five in Newfoundland and three in the Maritimes. Out of 119 2SW salmon tagged and released, 33 (28\%) were recaptured, 28 in Newfoundland, three in the Maritimes, and two in Quebec. Some of the tagged salmon were recaptured one and two years after tagging. The other recaptures were in Newfoundland along the northeast coast and south coast (Fig. 12). The mean river ages ranged from 2.4 to 2.9 years.

Site 14. Bay de Verde, 1953
Near Bay de Verde in 1953,167 salmon were tagged and released (Table 14). $0 f$ these, 37 ( $22 \%$ ) were recaptured, most of them in Newfoundland (Fig. 13). Out of 141 SW salmon recaptured, all were caught in Newfoundland. Out of the 19 2SW salmon recaptured, 18 were in Newfoundland and one was in Quebec. Three salmon were caught one and two years after tagging. Most of the salmon recaptured in Newfoundland were caught northwest of the tagging site. The river ages are unavailable.

Near Baccalieu Island in 1973, 15 salmon were tagged and released (Table 15). Of these, three 1 SW and one 2 SW salmon were recaptured, all of them in Newfoundland (Fig. 14). The mean river ages of the tagged salmon were 3.3 years for 1 SW and 3.0 years for MSW salmon.

Site 16. Heart's Content, 1975
Near Heart's Content in 1975, 65 salmon were tagged and released (Table 16). Of these, eight ( $12 \%$ ) were recaptured, seven in Newfoundland and one in the Maritimes. All of the recaptures in Newfoundland were to the northwest of the tagging site (Fig. 15). The mean river ages ranged from 2.7 years for 2 SW to 3.4 years for 1 SW salmon.

## Site 17. Bonavista, 1940

Near Bonavista in 1940, 454 salmon were tagged and released (Table 17). of these, 180 ( $40 \%$ ) were recaptured, 157 ( $87 \%$ ) of them in Newfoundland. Some of the recaptures occurred one and two years after tagging. In Newfoundland, the recaptures occurred to the south and northwest of the tagging site (Fig. 16). Out of 3861 SW salmon tagged, 151 (39\%) were recaptured and of these, 140 (93\%) occurred in Newfoundland and Labrador. Out of 50 2SW salmon tagged, 22 (44\%) were recaptured and of these, 14 ( $64 \%$ ) occurred in Newfoundland and Labrador, 7 (32\%) in the Maritimes, and one (5\%) in Quebec. The river ages of the tagged and recaptured salmon are unavailable.

Site 18. Cape Bonavista, 1973
Off Cape Bonavista in 1973, 25 salmon were tagged and released (Table 18). Of these, five ( $20 \%$ ) were recaptured and all of these were 1 SW salmon. All of the tagged salmon recaptured were caught in Newfoundland (Fig. 17). The mean river age of the tagged salmon was 3.1 years for 1 SW and 2.4 years for 2 SW salmon.

Site 19. Flat Island, 1952
Near Flat Island in 1952, 286 salmon were tagged and released (Table 19). Of these, 54 (19\%) were recaptured, most of them in Newfoundland (Fig. 18). Out of 256 1SW salmon tagged, 46 (18\%) were recaptured, 45 (98\%) in Newfoundland. Five recaptures occurred from one to three years after tagging. The river ages of the tagged and recaptured salmon are unavailable.

## Site 20. Cape Freels, 1973

Near Cape Freels in 1973, 36 salmon were tagged and released (Table 20). Of these, nine ( $25 \%$ ) were recaptured. All of the recaptured salmon were caught in Newfoundland and Labrador (Fig. 19). The mean river age of the 1 SW salmon was 2.8 years and the 2 SW was 3.0 years.

## Site 21. Fogo Island, 1973

Near Fogo Island in 1973, 25 salmon were tagged and released (Table 21). Of these, nine ( $36 \%$ ) were recaptured. Out of the nine tagged salmon recaptured, eight were in Newfoundland and one in the Maritimes. Two salmon were caught the year after they were tagged. Salmon were recaptured to the north and south of the tagging site (Fig. 20). The 2 SW salmon had a mean river age of 3.0 years while that of 1 SW salmon was 3.2 years.

## Site 22. Change Islands, 1951

Near Change Islands in 1951, 156 salmon were tagged and released (Table 22). Of these, 39 ( $25 \%$ ) were recaptured, four of them at a counting fence on the Gander River, Newfoundland. Out of 141 1SW salmon tagged, 31 ( $22 \%$ ) were recaptured; all of them in Newfoundland. Two of these salmon were caught the year after tagging. Recaptures occurred along the northeast coast to the northwest and southeast of the tagging site (Fig. 21). The river ages of these salmon are unavailable.

## Site 23. Twillingate, 1952

Near Twillingate in 1952, 36 salmon were tagged and released (Table 23). of these, four (11\%) were recaptured, one in Newfoundland, two in the Maritimes, and one in Quebec (Fig. 22). There were no tagged salmon recaptured in the immediate vicinity of the tagging site. The mean river ages varied from 2.4 years for 1 SW salmon to 2.8 years for previous spawners.

## Site 24. Twillingate, 1975

Near Twillingate in 1975, one 2 SW salmon was tagged and released (Table 24). It was not recaptured. It had a river age of three years.

## Site 25. Cape St. John, 1973

Near Cape St. John in 1973, 115 salmon were tagged and released (Table 25). Of these, $30(26 \%)$ were recaptured, 28 (93\%) in Newfoundland and Labrador, one (3\%) in the Maritimes, and one (3\%) in Quebec. One each of the 1SW and MSW salmon were recaptured the year after they were tagged. The recaptures of 1 SW salmon occurred to the north and south of the tagging site
(Fig. 23). Mean river ages ranged from 3.1 years for $15 W$ salmon to 4.0 years for previous spawners.

Site 26. Cape Fox, 1973
Near Cape Fox in 1973, 35 salmon were tagged and released (Table 26). of these, nine ( $26 \%$ ) were recaptured, all of them in Newfoundland. There were recaptures to the north and south of the tagging site and on the west coast of Newfoundland (Fig. 24). Mean river ages ranged from 3.2 years for 1 SW salmon to 3.4 years for 2 SW salmon.

Site 27. Hare Bay, 1973
In Hare Bay in 1973,69 salmon were tagged and released (Table 27). Of these, 16 (23\%) have been recaptured, and of these 14 ( $88 \%$ ) were in Newfoundland and two ( $12 \%$ ) were in the Maritimes. The recaptures of $15 W$ and 2SW salmon occurred to the north and south of the tagging site (Fig. 25). There were two $15 W$ salmon recaptured on the west coast of Newfoundland. There was one recapture two years after tagging. Mean river age was 3.3 years for all sea ages.

## LABRADOR

Site 28. Henley Harbour, 1973
Near Henley Harbour in 1973, 23 salmon were tagged and released (Table 28). Of these, six (26\%) were recaptured, all of them in Labrador. Most of the recaptures were to the north of the tagging site (Fig. 26). Mean river ages ranged from 3.8 years for $2 S W$ and previously spawned salmon to 5.0 years for $15 W$ salmon.

## Site 29. Cape Charles, 1948

Near Cape Charles in 1948,59 salmon were tagged and released (Table 29). Of these, eight ( $14 \%$ ) were recaptured, all of them in Newfoundland and Labrador. These recaptures occurred to the north and in rivers south of the tagging site and along the west coast of Newfoundland (Fig. 27). River ages of these salmon are not available.

## Site 30. Francis Harbour Bight, 1950

Near Francis Harbour Bight in 1950, 115 salmon were tagged and released (Table 30 ). of these, 14 ( $12 \%$ ) were recaptured, all of them in Newfoundland and Labrador. These recaptures occurred to the north and south of the tagging site and along the west coast of Newfoundland (Fig. 28). River ages of these salmon are unavailable.

## Site 31. Snug Harbour, 1971

Near Snug Harbour in 1971, four 1SW salmon were tagged and released (Table 31). Of these, one ( $25 \%$ ) was recaptured in Labrador to the south of the tagging site (Fig. 29). Mean river age of the tagged salmon was 3.3 years.

## Site 32. Square Islands, 1973

At Square Islands in 1973, 51 salmon were tagged and released (Table 32). of these, nine (18\%) were recaptured in Newfoundland and Labrador. These recaptures occurred to the north and south of the tagging site as well as on the west and northeast coasts of Newfoundland (Fig. 30). Mean river ages of the tagged salmon ranged from 3.6 years for 1 SW salmon to 4.2 years for 2SW salmon.

Site 33. Spotted Islands, 1973
Near Spotted Islands in 1973, 25 salmon were tagged and released (Table 33). Of these, seven ( $28 \%$ ) were recaptured. All of the recaptures were in Labrador; 4 in freshwater and 3 in the sea. The recaptures occurred to the north and south of the tagging site (Fig. 31). Mean river ages of the tagged salmon ranged from 3.5 years for previous spawners to 4.5 years for 1 SW salmon.

Site 34. Black Island, 1971
Near Black Island in 1971,44 salmon were tagged and released (Table 34). Of these, 13 ( $30 \%$ ) were recaptured. Two recaptures occurred the year after the salmon were tagged. Most of the recaptures were in rivers near the site where the fish were tagged. Two recaptures occurred south of the tagging site, one of these was in Newfoundland and the other was in Quebec (Fig. 32). Mean river ages ranged from 3.5 years for 2 SW salmon to 4.3 years for $15 W$ salmon.

Site 35. Gready, 1971
Near Gready in 1971, four salmon were tagged and released (Table 35). Of these, one ( $25 \%$ ) was recaptured near the tagging site in Labrador (Fig. 33). Mean river age of the tagged salmon was 4.3 years.

Site 36. Gready Island, 1973
Near Gready Island in 1973, 28 salmon were tagged and released (Table 36). $0 f$ these, 11 ( $39 \%$ ) were recaptured, all of them in Labrador (Fig. 34). All recaptures were in the vicinity of the tagging site. Mean river ages of the
tagged salmon ranged from 4.3 years for 1 SW salmon and previous spawners to 4.4 years for 2 SW salmon.

Site 37. Pack's Harbour, 1971
Near Pack's Harbour in 1971, 78 salmon were tagged and released (Table 37). Of these, 24 ( $31 \%$ ) were recaptured, most of them in rivers near the tagging site (Fig. 35). There were three 1 SW salmon recaptured one or more years after they were tagged. One salmon was recaptured north of the tagging site and three to the south. One of the southward bound salmon was recaptured on the west coast of Newfoundland. Mean river ages of the tagged salmon ranged from 4.1 years for 2 SW salmon to 4.6 years for 1 SW salmon.

Site 38. Cape Porcupine, 1971
Near Cape Porcupine in 1971, 10 salmon were tagged and released (Table 38). Of these, four ( $40 \%$ ) were recaptured, all of them in Labrador (Fig. 36). There was one tagged salmon recaptured two years after it was tagged. Mean river age of the tagged salmon was 3.8 years.

Site 39. Groswater Bay, 1974
In .Groswater Bay in 1974, 13 salmon were tagged and released (Table 39). Of these, six (46\%) were recaptured in Labrador. There were three salmon recaptured in Lake Melville, one north of the tagging site and two in the vicinity of the tagging site (Fig, 37). Mean river age of the tagged salmon was 3.9 years.

Site 40. Cape Makkovik, 1974
Near Cape Makkovik in 1974, six salmon were tagged and released (Table 40). Of these, three (50\%) were recaptured, all of them in Labrador. One was recaptured at the tagging site, another to the south, and the third in Lake Melville (Fig. 38). Mean river age of the tagged salmon was 4.0 years.

LABRADOR SEA AND GRAND BANK OF NEWFOUNDLAND

Site 41. Virgin Rocks, 1973
Near the Virgin Rocks on the Grand Bank of Newfoundland in 1973, three 1SW salmon were tagged and released (Table 41). Of these, two (67\%) were recaptured, one of them in the year that it was tagged and the other in the following year. One of the recaptures occurred in Fortune Bay and the other in Trinity Bay (Fig. 39). Mean river age of the tagged salmon was 3.0 years.

Sites 42-52. Labrador Sea, 1970-77
At various sites in the Labrador Sea from 1970 to 1977, 109 salmon were tagged and released (Tables $42-52$ ). Of these, 15 ( $14 \%$ ) were recaptured, seven in Newfoundland, three in the Maritimes, two in Quebec, one in Greenland, one in Ireland, and one in Scotland (Fig. 40). Mean river age of these salmon ranged from 2.0 years for 1 SW salmon and 3.5 years for 2 SW salmon.

## MIGRATION PATTERNS

## West Coast (Site 1)

There was not enough information for an indepth summary. The single salmon tagged and released moved further inside the bay from the tagging site prior to it's subsequent recapture in a commercial fishing net.

## South Coast (Sites 2-10)

In the Port-aux-Basques area on Newfoundland's south coast, salmon of all sea-ages have been tagged and released. These salmon migrated from the tagging area to southwest Newfoundland, and the Gulf of St. Lawrence areas of Quebec, New Brunswick and Nova Scotia. Only a few salmon were caught on the south coast of Newfoundland to the east of the tagging area. Recaptures were concentrated in Miramichi and Gaspé areas.

Towards the eastern side of the south coast, i.e. Placentia Bay, the proportion of salmon moving easterly increases over that to the west. Also in this area salmon were present that moved to the northeast and east coast of Newfoundland. Within bays, i.e. Fortune Bay, a higher proportion of salmon were migrating into rivers or were caught in the vicinity of the tagging site rather than making long-distant movements to rivers in Mainland areas of Canada.

## East Coast (Sites 11-19)

Salmon of all sea-ages that were tagged and released at sites along the east coast of Newfoundland were migrating both northward and southward to other areas of Newfoundland, as well as to Quebec, Nova Scotia and New Brunswick. The further north the tagging site, the higher was the proportion of northward migrating salmon. The recaptures of salmon the year after tagging suggested the presence of non-maturing salmon. Also present at southeast coast tagging sites were salmon that subsequently migrated to rivers of the Atlantic Coast of Nova Scotia and into the Bay of Fundy. This contrasts with the south coast tagging sites where there were no salmon recaptured on the Atlantic Coast of Nova Scotia or in the Bay of Fundy.

## Northeast Coast (Sites 20-27)

The migration patterns of salmon that were tagged and released in areas along the northeast coast of Newfoundland were similar to those along the east coast. Notable exceptions were those salmon tagged and released in Hare Bay where there were tagged salmon that were migrating to the northern portion of the northwest coast. Also present at northeast coast tagging sites in contrast to the southeast coast sites were 1 SW and MSW salmon that subsequently migrated to the coast of Labrador. Proportionately, more of the 1SW salmon tagged at northeast coast sites were recaptured in the area of tagging and in Newfoundland rivers. This may imply that a higher proportion of these salmon are of local origin than in other areas. There is also a trend to higher river ages with distance northwards along the northeast coast.

## Labrador (Sites 28-40)

The migration patterns of salmon that were tagged and released along the Labrador coast show salmon of all sea ages moving northward and southward from the tagging sites to rivers in Newfoundland and Labrador. Some salmon also migrated to insular Newfoundland. In the vicinity of Sandwich Bay there is a much higher proportion of salmon recaptured in nearby rivers than from southern Labrador. There was a single salmon that subsequently migrated to Quebec. There were no salmon recaptured in New Brunswick and Nova Scotia from those salmon tagged at sites in Labrador. Smolt tagging experiments have shown that salmon from New Brunswick and Nova Scotia do migrate along the Labrador coast; although the proportion is lower than in insular Newfoundland (Pippy 1982).

## Labrador Sea and Grand Bank of Newfoundland (Sites 41-52)

The recapture sites of salmon that were tagged and released at the Virgin Rocks suggested movements inshore to Newfoundland and then southward and northward around the coast (Fig. 39).

The recapture sites of salmon that were tagged and released in the Labrador Sea were inshore to Newfoundland, as well as Scotland, Ireland, Greenland, Quebec and New Brunswick (Fig. 40).

## SUMMARY

From 1940 to 1976, a total of 1968 1SW, 1206 2SW, 76 3SW, two 4SW, and 131 previously spawned salmon were tagged and released into the marine coastal waters of Newfoundland and Labrador (Table 53 and 54). Out of 3383 releases, $875(26 \%)$ salmon were recaptured. of these recaptures 578 salmon ( $66 \%$ ) were caught in Newfoundland, 105 (12\%) were caught in Labrador, 125 (14\%) were caught in the Maritimes, 66 ( $8 \%$ ) were caught in Quebec, and one at West Greenland. There were no tagged salmon recaptured in Maine, USA.

Of the 449 recaptures of 1 SW salmon tagged and released in Newfoundland coastal waters, 416 (93\%) were recaptured in Newfoundland and Labrador, in both freshwater and marine environments. Of the 292 recaptures of MSW salmon
tagged and released in Newfoundland coastal waters, 148 (51\%) were recaptured in Newfoundland and Labrador and 144 (49\%) in the Maritimes and Quebec. Of the 53 recaptures of 1 SW salmon tagged and released in Labrador coastal waters 52 (98\%) were recaptured in Newfoundland and Labrador. Of the 48 recaptures of MSW salmon tagged and released in Labrador coastal waters, all were recaptured in Newfoundland and Labrador. Therefore, it would seem that salmon destined to return to mainland Canadian rivers migrate through Labrador in a lower proportion than those that migrate through coastal waters of Newfoundland.

Out of a total of 875 recaptures of salmon tagged and released in Newfoundland and Labrador, 720 ( $82 \%$ ) were caught in marine fisheries and 155 (18\%) were in angling fisheries. Of the 1,968 1SW salmon tagged and released, $502(26 \%)$ were recaptured; of these $464(92 \%)$ occurred in the year of tagging, 31 ( $6 \%$ ) in the year after tagging, and nine ( $2 \%$ ) more than 2 years following tagging. Out of the $1,2062 \mathrm{SW}$ salmon tagged and released, 319 ( $26 \%$ ) were recaptured; and of these 303 (95\%) were recaptured in the year of tagging, the remaining 16 (5\%) were recaptured in the year following tagging. Of the 76 3SW salmon tagged and released, 19 (25\%) were recaptured; and of these 15 ( $79 \%$ ) were recaptured in the year of tagging and four ( $21 \%$ ) were recaptured one year or more following tagging. There were two 4 SW salmon tagged and released; both were recaptured in the same year that they were tagged. Out of 131 previously spawned salmon tagged and released, 33 ( $25 \%$ ) were recaptured; and of these 29 ( $88 \%$ ) were recaptured in the year that they were tagged and four ( $12 \%$ ) were recaptured in the year following tagging (Tables 53 and 54).

Of the 5021 SW salmon recaptured from salmon tagged and released into Newfoundland and Labrador waters, 427 ( $85 \%$ ) were recaptured in the sea and 75 ( $15 \%$ ) were recaptured in freshwater. of the 373 MSW tagged and recaptured, 293 (79\%) were recaptured in the sea and $80(21 \%)$ were recaptured in freshwater.

Of the 109 salmon tagged and released at various locations in the Labrador Sea, 15 ( $14 \%$ ) were recaptured (Table 55). Seven ( $47 \%$ ) were recaptured in Newfoundland, three (20\%) in the Maritimes, two (13\%) in Quebec, and one (7\%) each in Ireland and Greenland. There were no recaptures in Labrador.

There were three 1 SW salmon tagged and released at the Virgin Rocks in 1973; of which two were recaptured in Newfoundland. One was caught in the year it was tagged and another in the following year (Table 53).

## COASTAL MOVEMENTS AND MIGRATION PATTERNS

These experiments suggests highly complex migration patterns for the different stocks of salmon in the coastal fishing areas of Newfoundland and Labrador (Fig. 41). This conclusion is similar to that of Belding (1939), Murray (1966 and 1968), and Pippy (1982). From these patterns a number of facts emerge. First, all salmon stocks do not approach the coast at the same location en masse and then move along the coast to their rivers of origin. Instead, $\overline{i t} \overline{\text { would }}$ seem that individual salmon approach the coast at a given location and then move around the coast perhaps passing all or at least some of the other coastal bays. Second, since several recaptures were made the year after tagging, it is possible that some of the 1 SW salmon caught would
not have matured until after completion of a second winter at sea. These salmon undoubtedly move away from the coastal areas and back out into feeding areas in the Labrador Sea. Third, the patterns show both clockwise and counter-clockwise movements around the coast. Fourth, salmon found deeper within a bay are more likely to be of local origin than those further out nearer to headlands.

## ACKNOWLEDGMENTS

The authors acknowledge the input of Dr. A. A. Blair and Dr. A. W. May who were in charge of many of the investigations and to technicians $F$. Day, F. Burfitt, and N. Batten who carried them out. Biologists R. Porter, M. O'Connell, and T. Anderson reviewed the manuscript and provided many helpful suggestions.

Table 5. Summary of Atlantic salmon tagging experiment at site 5 in Fortune Bay, Newfoundland in 1976. ( $\mathrm{S}=$ sea recaptures, $\mathrm{R}=$ river recaptures)

1. Tagging area: Fortune Bay
2. Date: June 21 - July 13, 1976
3. Type of tag: Carlin, yellow plastic $Y$-series, $15 \mathrm{~mm} \times 5 \mathrm{~mm} \times 0.8 \mathrm{~mm}$ and wired with Type 316 soft stainless steel 0.3 mm diameter wire.
4. Method of attachment: A double needle approximately 8 m apart was inserted through the dorsal musculature just below the anterior part of the dorsal fin. The tag hung from the left side of fish.
5. Type of gear: Salmon traps and a Multi-purpose trap.

Table 11. Summary of Atlantic salmon tagging experiment at site 11 near Renews, Newfoundland in 1973. ( $S=$ sea recaptures, $R=r i v e r$ recaptures)

1. Tagging area: Renews
2. Date: June 4 - 7, 1973
3. Type of tag: Carlin, red plastic Y-series, $15 \mathrm{~mm} \times 5 \mathrm{~mm} \times 0.8 \mathrm{~mm}$, and wired with Type 316 soft stainless steel 0.3 mm diameter wire.
4. Method of attachment: A double needle, approximately 8 mm apart, was inserted through the dorsal musculature just below the anterior part of the dorsal fin. The tag hung from the left side of fish.
5. Type of gear: Salmon Driftnets.

1. Tagging area: Hearts Content ( $47^{\circ} 53^{\prime} 30^{\prime \prime} \mathrm{N} ; 53^{\circ} 23^{\prime} 30^{\prime \prime} \mathrm{W}$ )
2. Date: May 17 - June 23, 1975
3. Type of tag: Carlin, red plastic Y-series, $15 \mathrm{~mm} \times 5 \mathrm{~mm} \times 0.8 \mathrm{~mm}$, and wired with Type 316 soft stainless steel 0.3 mm diameter wire.
4. Method of attachment: A double needle, approximately 3 mm apart, was inserted through the dorsal musculature just below the anterior part of the dorsal fin. The tag hung from the left side of fish.
5. Type of gear: Salmon Traps and Moored nets.

1. Tagging area: Change Islands
2. Date: May 28 - August 7, 1951
3. Type of tag: Light red celluloid, $31 \mathrm{~mm} \times 8 \mathrm{~mm} \times 0.8 \mathrm{~mm}$ and wired with nickel 0.8 nom diameter wire.
4. Method of attachment: Single loop of wire through the musculature imediately in front of dorsal fin. The tag hung from the left side of fish.
5. Type of gear: Set Gillnets.

Table 28. Summary of Atlantic salmon tagging experiment at site 28 near Henley Harbour, Labrador in 1973. ( $S=$ sea recaptures, $R=r i v e r ~ r e c a p t u r e s$ )

1. Tagging area: Henley Harbour ( $52^{\circ} 00^{\prime} 53^{\prime \prime} N$; $55^{\circ} 37^{\prime} 53^{\prime \prime} \mathrm{W}$ )
2. Date: June 23, 1973
3. Type of tag: Carlin, red plastic Y-series, $15 \mathrm{~mm} \times 5 \mathrm{~mm} \times 0.8 \mathrm{~mm}$, and wired with Type 316 soft stainless steel 0.3 mm diameter wire.
4. Method of attachment: A double needle, approximately 8 mm apart, was inserted through the dorsal musculature just below the anterior part of the dorsal fin. The tag hung from the left side of fish.
5. Type of gear: Salmon Driftnets.

1. Tagging area: Black Island, Labrador
2. Date: July $20-23,1971$
3. Type of tag: Carlin, red plastic Y-series, $15 \mathrm{~mm} \times 5 \mathrm{~mm} \times 0.8 \mathrm{~mm}$, and wired with Type 316 soft stainless steel 0.3 mm diameter wire.
4. Method of attachment: A double needle, approximately 8 mm apart, was inserted through the -dorsal musculature just below the anterior part of the dorsal fin. The tag hung from the right side of fish.
5. Type of gear: Salmon Driftnets.

2. Date: July 31, 1974
3. Type of tag: Carlin, red plastic Y-series, $15 \mathrm{~mm} \times 5 \mathrm{~mm} \times 0.8 \mathrm{~mm}$, and wired with Type 316 soft stainless steel 0.3 mm diameter wire.
4. Method of attachment: A double needle, approximately 8 mm apart, was inserted through the dorsal musculature just below the anterior part of the dorsal fin. The tag hung from the left side of fish.
5. Type of gear: Salmon Driftnets.

Fig. 40. The tag release and recapture locations for Atlantic salmon tagged at sites 42-52 in the Labrador sea from 1970 to 1977. The numbers beside the open symbols (tagging sites) are the number tagged and released; whereas, the numbers beside the solid symbols (recapture sites) are the sea ages of the salmon when tagged.

Table 53. Summary of recaptures from Atlantic salmon experiments 1-27 in insular Newfoundland from 1940 to 1977 . (S=sea recaptures, R=river recaptures).

Fig. 41. Movements of salmon in Newfoundland's coastal waters. This map does not show the main migration routes of specific stocks of salmon in these waters but rather a combination of many different migratory patterns. Movements of kelts, particularly along the west coast are not necessarily depicted. This figure was taken from Pippy (1982).
