HEALTH PRODUCTS MENTIONED IN THIS ISSUE

**Pharmaceuticals and Biologics**
- Abilify (aripiprazole tablets)
- Abilify Maintena (aripiprazole for prolonged release injectable suspension)
- Alveda Atropine Injection BP 0.4 mg/mL
- Alveda Epinephrine Injection USP 1 mg/mL
- Avastin (bevacizumab)
- Holkira Pak (ombitasvir/paritaprevir/ritonavir and dasabuvir)
- Primene 10% Amino Acid Solution, 250 mL
- Propecia (finasteride)
- Proscar (finasteride)
- Technivie (ombitasvir/paritaprevir/ritonavir)
- Votrient (pazopanib)

**Other**
- Foreign health products
- Unauthorized health product (Dragon Power)
- Unauthorized health product (Natrol DHEA 25 mg)

This monthly publication is intended primarily for healthcare professionals and includes information on pharmaceuticals, biologics, medical devices and natural health products. It provides a summary of key health product safety information published in the previous month by Health Canada, as well as a selection of new health product safety information meant to raise awareness. New information contained in this issue is not comprehensive but rather represents a selection of clinically relevant items warranting enhanced dissemination.

</table>
| **Information Update**  
**Summary Safety Review** |
| This safety review evaluated the potential link between Abilify and Abilify Maintena and the risk of certain impulse control behaviours. Health Canada’s review concluded that there is a link between the use of aripiprazole and a possible risk of pathological gambling or hypersexuality. The Canadian product monograph for both these products has been updated to advise of these risks. Health Canada has also communicated this information to Canadians. |

**Unauthorized health product**

**Dragon Power**

**Advisory**

Dragon Power, an unauthorized product sold at The Herb Depot in Toronto, Ontario, was found to contain an undeclared prescription drug (sildenafil) that may pose a serious risk to the health of Canadians. The product may also have been sold bearing the Natural Product Number (NPN) 80025214, or under the names “Super Dragon Power” or “Dragon Power II”.

---

**Unauthorized health product**

**Natrol DHEA 25 mg**

**Advisory**

Health Canada informed Canadians that an unauthorized health product, Natrol DHEA 25 mg, was being sold on amazon.ca for hormonal management. This product may pose a serious risk to the health of Canadians.

---

**Votrient (pazopanib)**

**Summary Safety Review**

This safety review evaluated the potential link between Votrient and the risk of pericardial effusion. Health Canada’s review concluded that there was not enough information to support a link. Health Canada has requested that the manufacturer continue to provide information on this safety issue, and will continue to monitor the situation.

---

**NEW HEALTH PRODUCT SAFETY INFORMATION**

*The following topics have been selected to raise awareness and, in some cases, to stimulate reporting of similar adverse reactions.*

---

**REVIEW ARTICLE**

**Finasteride and suicidality**

Finasteride is a type II 5 alpha-reductase inhibitor indicated for the treatment and control of benign prostatic hyperplasia (Proscar) and male pattern hair loss (Propecia). The enzyme 5 alpha-reductase is involved in the transformation of a variety of endogenous steroids, including the metabolism of testosterone. Finasteride was first marketed in Canada in 1992 as Proscar (5 mg) and subsequently in 1998 as Propecia (1 mg).

As of January 31, 2015, Health Canada received 12 reports of suicidality suspected of being associated with the use of finasteride in Canada.

- The potential link between finasteride and suicidality has also been reported in the medical literature, including the persistence of symptoms after treatment discontinuation. However, evidence is limited at this time and is insufficient to confirm a link.

- Of the 12 patients, 2 recovered while 6 had not yet recovered at the time of reporting. The outcome was not stated in 3 reports. The last case reported a completed suicide but a causal relationship between finasteride and suicidality could not be established as limited information was available. Overall, 5 of the 12 reports were unassessable due to the limited information provided. Detailed assessable cases are presented in Table 1.
The most compelling case reported to Health Canada (Table 1, no.1) described a patient feeling depressed and irritable one week after starting finasteride to treat hair loss; this eventually led to suicidal thoughts. He subsequently ceased the medication and after 3 days, he started to feel normal. He reported that the anxiety, depressed feelings and suicidal thoughts had completely disappeared shortly after discontinuation. The patient had no prior history of depression, and the report suggested that no other changes had occurred in his life at that time.

Key points (continued)

- Healthcare professionals are encouraged to report to Health Canada any adverse reaction suspected of being associated with finasteride use.

Table 1: Summary of detailed reports of suicidality suspected of being associated with the use of finasteride, submitted to Health Canada from date of marketing to January 31, 2015.*

Note: NA = not available.

*These data cannot be used to determine the incidence of adverse reactions (ARs) because ARs are underreported and neither patient exposure nor the amount of time the drug was on the market has been taken into consideration.
†Estimated from the beginning of treatment.
‡Daily dose not specified in the report.
Suicidality in association with finasteride use has been recently reported in the literature, both at lower doses (to treat male pattern hair loss) and at higher doses (to treat benign prostatic hyperplasia). Studies conducted in former users of finasteride (including young men who used low doses), have also described persistent adverse events such as sexual dysfunction and suicidality despite having discontinued the drug for a number of months. The interaction between sexual dysfunction and depression is complex, as one may lead to the other. However, according to the literature, finasteride could affect brain function and trigger depression and suicidal ideation independently of sexual dysfunction. The blockade of 5 alpha-reductase by finasteride could reduce levels of neuroactive steroids, which may have an impact on psychological and cognitive outcomes, including mood, depression and overall well-being.

In addition, the medical literature has recently been referring to Post-Finasteride Syndrome (PFS) when describing persistent sexual, neurological, and physical adverse reactions in patients who have taken finasteride and discontinued the treatment. The U.S. National Institutes of Health (NIH) recently added PFS to its list of genetic and rare diseases. According to the NIH, studies are underway to better understand the safety profile of 5 alpha-reductase inhibitors with respect to adverse reactions (sexual dysfunction, breast outcomes, and depression) and their permanency.

In Canada, suicidal ideation is not listed in the Canadian product monographs (CPMs) for Proscar and Propecia, as evidence is limited at this time and insufficient to confirm a link, but depression is listed in the Post-Market Adverse Drug Reactions section. This is similar to the situation in the United States and Europe. The possibility of persistent sexual dysfunction is also listed in the CPMs.

Suicidal ideation is a serious clinical event and raising awareness among healthcare professionals and patients of this potential risk is important. Healthcare professionals are encouraged to report to Health Canada any case of suicidality or any other adverse reaction suspected of being associated with finasteride. Information such as the dose, treatment duration, indication, concomitant medications, comorbidities and/or other underlying conditions, and time to onset of the adverse reaction should be included where possible.
