NOTES ON PRICES AND PRICE INDEX NUMBERS

Industry Selling Price Indexes (1956=100)

In 27 manufacturing industries, Industry Selling Price Indexes were higher in March than in February, 9 less than in the previous month-to-month comparison when 36 industries rose above January levels. Twenty-five industry indexes were lower in March, 2 more than in the January-February period when 23 declined. Forty-five of the 97 indexes were unchanged in March, compared to 38 which remained the same between January and February.

The average level of the 97 indexes was 103.6 in March, unchanged from February. The median was 103.9 (half the indexes were above 103.9 and the other half below 103.9) down from the February median of 104.5.

The following table summarizes February-March price movements by major industry group:

General Wholesale Index (1935-39=100)

The General Wholesale Index eased fractionally to 237.1 in March, practically unchanged from the February index of 237.2, and 2.5 per cent above the March 1961 index of 231.3. Three major group indexes declined in March, while increases were recorded for the remaining five groups.

Lower prices for livestock, and fresh and cured meats outweighed higher prices for fishery products, eggs, and dressed fowl and were chiefly responsible for an 0.6 per cent drop in the Animal Products Group index in March to 255.0 from the February index of 256.6. Minor decreases of less than 0.1 per cent occurred in two major group indexes; Non-ferrous Metals Products to 188.0 from 188.1, and Iron Products to 257.5 from 257.6.

The Textile Products Group index rose 0.4 per cent to 239.1 in March from the February index of 238.2 mainly on higher prices for worsted and wool cloth, and raw cotton. Minor increases of 0.2 per cent or less were recorded for the following four major group indexes: Chemical Products to 190.2 from 189.9, Vegetable Products to 210.5 from 210.2, Wood Products to 310.0 from 309.8, and Non-metallic Minerals Products to 187.8 from 187.7.

The following table shows some of the more noteworthy changes:

Canadian Farm Products Price Index (1935-39=100)

The price index of Canadian Farm Products at terminal markets eased 0.9 per cent from 219.2 to 217.3 between February and March. The Animal Products index moved down 1.2 per cent from 270.8 to 267.5 reflecting lower prices for calves on both Eastern and Western Markets, and for hogs, cheese-milk and steers in the East. Showing higher were wool in the West, lambs and poultry in the East and for eggs both East and West. The Field Products index declined 0.2 per cent from 167.5 to 167.1 reflecting lower prices for peas and wheat in the East and for potatoes in the West. Prices were higher for hay and flax in the West and for rye on both markets.

With this issue, indexes for the crop year August 1960-July 1961 are final. See page 48 for details of prices for Western grains.

Thirty Industrial Materials Price Index (1935-39=100)

The index of thirty industrial materials, calculated as an unweighted geometric average, moved up 0.4 per cent from 246.2 to 247.1 between February and March. Prices for eight commodities advanced and seven declined, while fifteen remained unchanged. Principal changes included increases for sisal, raw wool, fir timber, raw sugar, linseed oil, raw cotton and tin, and decreases for iron ore, steel scrap, raw rubber, steers and cottonseed oil.

Security Price Indexes

The Investors Index of common stock prices (1935-39=100) moved up 0.5 per cent between February and March from 329.8 to 331.6. Among major groups, Industrials rose 0.9 per cent from 344.4 to 347.4, while Utilities and Banks both declined, Utilities 0.9 per cent from 230.0 to 227.9 and Banks 0.5 per cent from 415.8 to 413.9. In Industrials, increases for five sub-groups were headed by Pulp and Paper, Building Materials, and Beverages; minor decreases for three sub-groups were headed by Oils;

and one group, Food and Allied Products, showed no change. In Utilities, Power and Traction and Transportation declined, while Telephones moved up slightly.

The Mining Stock Indexes (1935-39=100) eased 0.6 per cent lower from 136.4 to 135.6 reflecting decreases of 0.6 per cent for Base Metals from 257.9 to 256.4 and 0.4 per cent for Golds from 83.2 to 82.9.

Four supplementary indexes (1956=100). Between February and March two indexes declined and two advanced as follows: Primary Oils and Gas, down 1.8 per cent from 73.9 to 72.6, Investment and Loan down 0.9 per cent from 196.4 to 194.7, Uraniums up 1.8 per cent from 78.2 to 79.6, and Pipelines up 0.1 per cent from 154.1 to 154.2.

The Preferred Stock Index (1935-39=100) advanced 0.4 per cent between February and March from 167.7 to 168.3.

The Consumer Price Index (1949=100)

The Consumer Price Index declined 0.1 per cent from 129.8 to 129.7 between February and March 1962. Decreases in the Food and Transportation indexes offset increases in the Clothing, and Tobacco and Alcohol indexes. The Housing, Health and Personal Care, and Recreation and Reading indexes were unchanged.

The Food index declined 0.5 per cent from 125.0 to 124.4, largely as a result of price decreases for beef ranging up to seven cents per pound for some cuts. Other price declines were generally limited to fats, turkey, bacon and a few fruits and vegetables, particularly bananas and lettuce. Prices were higher for most fresh vegetables, some fruits, eggs and whole milk.

The Housing index was unchanged at 134.0. The shelter component remained at its February level while a slight upward movement in the household operation component was not sufficient to move the index. In shelter, both rent and home-ownership were unchanged. In household operation, declines in fuel and lighting, and supplies and services, were outweighed by price increases for furniture, floor coverings, textiles, and utensils and equipment.

The Clothing index rose 1.0 per cent from 111.8 to 112.9. Group indexes for men's, women's and children's wear were all higher, largely reflecting further upward movement from sales levels of previous months. Clothing services were up as a result of higher prices for laundry and dry cleaning. Shoe repair prices were slightly lower.

The Transportation index declined 0.6 per cent from 140.7 to 139.9 as lower prices were reported for new passenger cars, tires, lubrication, muffler replacement and brake relining in the automobile operation component. These offset somewhat higher prices for batteries and automobile repairs. Higher bus fares moved the local transportation index.

The Health and Personal Care, and Recreation and Reading indexes remained unchanged at their February levels of 157.2 and 146.7 respectively.

The Tobacco and Alcohol index rose 0.3 per cent from 117.2 to 117.5 as a result of higher prices for alcoholic beverages in Alberta.

Wholesale Price Indexes

Industry Selling Price Indexes (1956=100)

Industry Selling Price Indexes are published for most of the manufacturing industries and as such are the first Canadian "wholesale" price indexes to be organized according to an industry classification. Because of their common form of organization these indexes may be used in conjunction with a whole array of related statistics such as shipments, employment and inventories, to name a few, which also conform to the Standard Industrial Classification. Thus, Industry Selling Price Indexes have a clearly defined conceptual basis which fits into a common framework of analytical statistics. For this reason and because of their relatively high standard of representativeness they are recommended over their counterpart commodity series of the General Wholesale Index for purposes relating to output of manufacturing industries. However, because Industry Selling Price Indexes are available only since 1956 (in a few cases since 1949) the General Wholesale Index and its components must still be relied upon for earlier periods.

A complete description of these indexes is contained in:

Industry Selling Price Indexes 1956-59

Catalogue No. 62-515

General Wholesale Index (1935-39=100)

The General Wholesale Index is a commodity classified index of prices. The index is "general" inasmuch as it incorporates a diverse selection of both primary and processed commodities. It is called "wholesale" because its ingredient prices relate to that broad and heterogeneous area of commodity distribution which excludes only retail trade. In fact, the term "wholesale" has more of a connotation of bulk trading than of any homogeneous level of distribution. Thus, though the index mainly includes prices of producers, it also covers transactions of "middle men" who trade in commodities of a type or in quantities characteristic of primary marketing functions.

Though general wholesale price indexes have been calculated by many countries for years there is no precise answer to the question of what such an index measures. This is so because the index cannot be associated with any adequately definable value aggregate. Unlike a consumer price index which can be identified with expenditures of household consumers, a general wholesale index covers a host of overlapping transactions sometimes involving the same ingredient in as many as three different stages of processing. Yet, conceptually, it is not a measure of the purchasing power of money because it omits significant areas of monetary transactions such as prices of land, labour, securities and services, except in so far as prices of these things are implicit in commodity prices. As a conventional summary figure, its use has tended towards a reference level against which to observe the behaviour of particular price groups such as farm products, industrial materials, building materials and the various other groupings for which indexes are published. And as an indicator of general business conditions it is usually included in the group which is regarded as approximately coincident with the business cycle. However, its main attribute now lies in its long historical continuity.

Canadian Farm Products

Wheat prices used in this index are buying prices of the Canadian Wheat Board, for Nos. 1, 2 and 3, Manitoba Northern at Fort William-Port Arthur. The initial payment price is first used and revised as further payments are announced.

Final wheat participation payments for the crop year August 1960-July 1961 were announced April 2, 1962. The price of No. 1 Manitoba Northern was adjusted to $1.791 per bushel, No. 2 to $1.759 and No. 3 to $1.743, and the indexes revised accordingly. An interim payment on all grades of wheat was announced November 2, 1961 for the crop year August 1960-July 1961 bringing the price of Manitoba Northern No. 1 to $1.50. Subsequent indexes are based on an initial payment of $1.50 for Manitoba Northern No. 1.

Commencing August 1, 1949, Western oats and barley were brought under control of the Canadian Wheat Board. Prices used for Canadian Farm Products since that time have been initial payments to farmers, with participation payments included whenever they are announced. For the crop year 1960-1961 final payment announced December 11, 1961 brought the price to $.741 per bushel for No. 2 C.W. oats; final payment announced January 10, 1962 brought the price to $.949 per bushel for No. 1 Feed barley. Initial payment for the crop year 1961-1962 was $.60 for No. 2 C.W. oats and $.87 for No. 1 Feed barley.

For final revised indexes August 1945 to July 1952 see Prices and Price Indexes, May 1953, Table 21. For subsequent years see Table 4 of February 1954, May 1955 and 1956, and Table 2 of May 1958, July 1959, June 1960 and June 1961. Indexes subsequent to July 1961 are subject to revision.

The Non-Residential Building Materials Price Index (1949=100)

A second special purpose price index related to the construction industry entitled "Non-Residential Building Materials Price Index" is shown in Table 8. This index has been constructed specifically to measure the price change of materials used in non-residential building construction. It supplements a price index applicable to materials used in residential construction which has been available for some years. The new index has been constructed on the base 1949=100, using weights obtained from data on cost of building materials provided by general and trade contractors for a sample of buildings constructed in Canada during the years 1948-1950.

The methods of constructing the index are explained in some detail in D.B.S. Reference Paper No. 43, entitled "Non-Residential Building Materials Price Index, 1935-1952", which was released on August 21, 1953 and which is available for the sum of 25 cents on request to the Dominion Statistician. This publication also comments on the uses and limitations of the index, and provides the total index by years from 1935 to 1952, and by months for the period January 1949-July 1953. Price indexes for twelve principal component material groups have been calculated by months from January 1949 to July 1953 and these indexes are also contained in the above mentioned publication.

The Residential Building Materials Price Index (1935-1939=100)

This index, which was first published in 1949, was developed to meet the need for a measurement of the price change of that part of housing costs represented by materials. In addition to the composite index which measures the price change of all materials used in residential construction, price indexes are published for nine component material groups. The weights for individual material items and groups of items within the index were based on the estimated material requirement for a national housing target for the year 1946, and the index was calculated on the base 1935-1939=100. However, to facilitate comparisons of its movements with those of the new non-residential series, Table 2 shows it arithmetically converted to the base 1949=100. Additional information concerning this index may be found in the special bulletin "Price Index Numbers of Residential Building Materials, 1926 to 1948", obtainable for 10 cents on request to the Dominion Statistician.

As a first step in a revision program, the structure of the Residential Electrical Equipment and Fixtures index has been revised. Both items priced and weights have been brought into line with latest available data on current building practices. The price reference base will continue as 1935-1939=100. For the new weighting diagram effective from July 1959 see "Prices and Price Indexes, August 1959".

Retail Price Indexes

Consumer Price Index

The Consumer Price Index was constructed to replace the Cost-of-Living Index and was first published October 23, 1952, on a time base 1949=100 and weights based on family expenditure patterns of 1947-48. A revision of the Consumer Price Index on the basis of 1957 expenditures while retaining the time base 1949=100, was released in an occasional paper on March 21, 1961 and the revised 1957-weighted index became the official measurement of price change forward from January 1961. The purpose of this latest revision was to bring the items included in the index, and their weights, into line with current family spending patterns.

The Consumer Price Index measures the percentage change through time in the cost of purchasing a constant "basket" of goods and services representing the purchases made by a particular population group in a specified time period. The basket is a constant or equivalent quantity and quality of goods and services but only items for which there is a continually measurable market price over time, corresponding to a specific quantity of the item, are included in the basket.

The index relates to a broad but specific group of urban families and reflects the price changes experienced by that "target group". The index is unlikely to represent closely the experience of any one family within the group nor should it be expected to reflect price change for other population groups for which income, family size and place of residence are characteristically different. The target group to which the revised index relates is composed of families - (a) living in cities with over 30,000 population, (b) ranging in size from two adults to two adults with four children, and (c) with annual incomes during 1957 ranging from $2,500 to $7,000.

To measure the influences of price change on the cost of goods and services purchased by such families, the Consumer Price Index contains some 300 items.

Full details on the revised index are available in the occasional paper "The Consumer Price Index for Canada (1949=100) - Revision Based on 1957 Expenditures", D.B.S. Catalogue Number 62-518.

Consumer Price Indexes for Regional Cities: Consumer Price Indexes are published monthly in this bulletin for the following cities or city combinations: St. John's, Halifax, Saint John, Montreal, Ottawa, Toronto, Winnipeg, Saskatoon-Regina, Edmonton-Calgary and Vancouver. With the exception of the index for St.John's, Newfoundland, which is constructed on the base June 1951 = 100, all indexes are on the base 1949 = 100. The regional indexes with the exception of the one for St. John's, are patterned after the Consumer Price Index for Canada. They are similar to this index in terms of family coverage, item content and weighting system.

These indexes fulfill the same purpose as the cost-of-living series which they replace, viz.: each index is designed to measure the influence of changes in retail prices taking place in the localities specified, upon the cost of a fixed basket of goods and services representing the level of consumption of a representative group of families in those particular areas.

In using the city indexes, it should be remembered that they are not indicators of comparative levels of prices as between the cities. That is, they do not in any way indicate whether prices are higher or lower in one city than in another. This fact may be illustrated by reference to temperature changes occurring in two cities. Suppose that in city A the temperature increases by 20 per cent from Time 1 to Time 2, and that in city B it increases 30 per cent during the same interval. In this instance an index of temperature change for City A would be 120 at Time 2 when Time 1 = 100, and the corresponding index for city B would be 130. From these indexes, it is obviously impossible to say whether or not it is warmer or colder in city A or city B. While the indexes form valid measurements of temperature change, they do not in any way indicate the comparative levels of temperature.

Price Index Numbers of Commodities and Services Used by Farmers: The index of Commodities and Services used by Farmers is designed to measure the change in retail prices of farm operating costs and farm living costs. It is calculated thrice yearly, viz.: January, April and August, and is on the base 1935-39=100. For an explanation of method of construction and an historical record, please refer to "Price Index Numbers of Commodities and Services Used by Farmers, 1913 to 1948 (Revised 1948)." A special bulletin giving total and group index detail is released subsequent to each pricing date.

Security Price Indexes

Price index numbers of industrial, utility, bank and mining common stocks, and preferred stocks are calculated from Montreal and Toronto exchange quotations. The indexes are designed to reflect weekly and monthly changes of interest to the investor, rather than day-to-day changes of more speculative interest. Individual stock prices are weighted by the number of shares outstanding in January of each year. The list is reviewed completely in January of each year, when new series are introduced and series of declining importance are discontinued. The Investors Index of 87 Common Stocks and the Mining Stocks Index are based on the average of the Thursday closing prices. The Preferred Stock Index is a monthly average of daily quotations.

Four additional indexes of common stock prices, relating to important categories of stocks not covered by existing series, were introduced May 1960. These will be published as interim indexes pending complete revision of the security price indexes. The price reference date for the new series is 1960; construction and weighting methods conform to those of existing indexes.

Measuring the Purchasing Power of Earnings

Changing consumer price levels affect the amounts of goods and services which a dollar will buy, and average earnings, of course, will be affected in the same way. An earnings measurement which takes the change of consumer prices into account, can be calculated by reducing actual earnings averages by the percentage amounts consumer price levels rise, or increasing them by the amount price levels fall. The adjusted averages may be used to indicate the comparative quantities of goods and services which could be purchased by average earnings if consumer price levels had remained constant. The following illustration shows how this kind of adjustment can be made.

Suppose that a series of weekly average wages rises from $50.00 in week A to $60.00 in week B, and that in the same interval a consumer price index advances from 100.0 to 110.0. Because of the 10 per cent rise in consumer prices, $1.00 will not buy as much in week B as it would in week A. Likewise, the 20 per cent rise from $50.00 to $60.00 will overstate the increase which has occurred in the purchasing power of average weekly wages. This overstatement can be removed by reducing the figure of $60.00 by the amount of the consumer price increase. An adjusted average of $55.00 ($60.00/110.0 x 100.0), may be referred to as a weekly wage average for week B, expressed in the dollars of period A, or it may be said to indicate the level of real weekly wages relative to week A.

The foregoing calculation can be carried a step further to express in index number form the relationship between the week A average of $50.00 and the week B figure of $55.00. Taking the week A average of $50.00 as equal to 100.0, the week B index becomes 110.0 ($55.00/50.00 x 100.0). Such an index may be called an index of weekly real wages. It indicates that average wages for week B will buy 10 per cent more goods and services than those received in week A, in spite of a 10 per cent rise in consumer prices. This 10 per cent increase in real wages compares with the rise of 20 per cent in money wages ($60.00/50.00 x 100.0).

It should be noted that while the estimates of average real wages may reflect the experience of broad groups of workers fairly well, their applicability to individual wage earners depends upon a number of considerations. For example, individual earnings will differ significantly from the group average, depending upon occupation, industry, geographical location, or the sex of the wage earner. Moreover, individual spending habits differ widely, while the consumer price index which is used to adjust the earnings data is based on the average consumption pattern of a large group of urban population. Also, group-spending patterns change over periods of time. To the extent that this occurs, the earnings data adjusted by the consumer price index (which has a "fixed" consumption pattern), will gradually be rendered less valid. Finally, some part of income is saved, and it should be borne in mind that it is not appropriate to reduce savings to a constant dollar basis by using a price which reflects consumption patterns.

It should also be kept in mind that measures of change in real earnings calculated from averages of gross earnings may differ from changes in the purchasing power of "take-home" pay, due to such factors as changes in personal income tax and pay deductions for such things as social insurance and pension plans. Neither do they take into account other family income, or changes in the savings position of families. Thus index numbers of real wages should not be interpreted as measuring fluctuations in the levels of consumption of wage-earners or wage-earners' families; they are intended to show only the trend in purchasing power of wages over the items covered by the price index.

In Table 12, page 41 figures for 1949 are used as reference levels for indexes of both actual and real wages, since this is the year selected by the Dominion Bureau of Statistics for general post-war index number comparisons. However, the adjustment made in the foregoing illustration can be applied to any reference level, and it should not be inferred that the 1949 reference period has any special validity for earnings comparisons. Percentage change between any two periods will be the same regardless of the reference period selected.

Weekly Wages in Current Dollars relate to the last pay periods in the month, while the Consumer Price Index relates to the beginning of the month. In calculating Weekly Wages in 1949 Dollars, the Weekly Wages in Current Dollars for any month are therefore adjusted by the Consumer Price Index for the following month as being more representative of the period in which the wages are spent.

Spatial Retail Food Price Indexes for Selected Canadian Cities

1956-61

For some years the Dominion Bureau of Statistics has been investigating the problems of calculating indexes which will indicate, with some precision, the extent of the differences in the average level of retail prices between major Canadian cities. In commodities and services other than food, problems of comparability of items are of major significance and it has not yet been possible to cover these areas of family budgets.

In foods, however, the problem of comparability of items between cities is at a minimum, and it has been possible to calculate indexes which are considered to indicate the extent of the difference in the average level of retail food prices between Winnipeg and 10 other major Canadian cities with sufficient reliability. These have been calculated annually for 1956, 1957, 1958, 1959 and 1960, and will be maintained on an annual basis in the future.

These indexes have been calculated on the basis of prices collected in each of the eleven cities, weighted in accordance with average urban food expenditures as contained in the weighting diagram of the Canada Consumer Price Index. Because of the differences in food purchases between cities it is impossible to calculate entirely accurate measurements. The closest approximation would be derived, for example, from the use of both Winnipeg and Vancouver weights in the calculation of the Winnipeg-Vancouver comparison, rather than the use of average urban food expenditures. However, the calculation of a number of indexes using weights relating to each city did not produce indexes significantly different from those which appear in Table 13 on page 41. This reflects the fact that while differences in food purchases exist, the magnitude of the differences in the cities covered is not such as to affect spatial comparisons significantly.

In addition to the problem of weights, the difficulty of obtaining prices for identically the same description of each food item in each city is of some consequence. While considerable care is taken to minimize differences due to variations in quality of the items priced, it is impossible to completely eliminate all such variations. This is particularly true in the case of beef items, where variations in consumption by grades as between cities undoubtedly affect the resultant price comparisons.

While these indexes have been expressed in terms of Winnipeg = 100, the selection of Winnipeg as the base city has no significance, and the indexes may be expressed on the base of any of the eleven cities included.
