Espèces d’oiseaux aquatiques abattus au Canada pendant les saisons de chasse de 1976 et 1977
par J.S. Wendt, F.G. Cooch et K.L. Newell

Introduction

Méthodes

Résultats
Le tableau 1 présente l’échantillon du Relevé de la composition des espèces de 1977. On ne peut pas calculer directement à partir du RCE certaines caractéristiques de l’échantillon, comme sa taille nette et le taux de réponse. De nombreux chasseurs n’inscrivent pas leur numéro de permis sur les enveloppes et un grand nombre de numéros de permis ne se retrouvent pas dans ceux choisis pour le relevé. Par conséquent, le taux de réponse indiqué au tableau 1, soit le nombre de numéros de permis distincts reçus divisé par le nombre d’envois, ne représente pas exactement le nombre de chasseurs qui ont fourni des données. De même, la représentation nette de l’ensemble des chasseurs n’est qu’approximative. Le taux de réponse indiqué pour le relevé est encore faussé par le fait que de nombreux chasseurs qui reçoivent des enveloppes ne chassent pas ou n’abattent aucun oiseau. Les nombres estimatifs de ces chasseurs sans prises sont soustraits du nombre d’envois avant de calculer le taux de réponse des chasseurs avec prises.
