1. EXECUTIVE SUMMARY

The objective of this study was to document the extent of private HF and VHF radio system usage North of 60° latitude, to identify the ownership and location of the systems and to establish reason or reasons for their existence. The data resulting from the study are intended to be used as input material for the development of a general licensing policy for HF and VHF private radio systems in the North.

The approach to the study was to prepare a complete inventory of all private systems in the North, using the DOC frequency assignment lists as service data. In the process of compiling and analyzing the inventory it became evident that the licensing records are at wide variance with the actual situation and include many assignments which are no longer active. There is a real requirement for purification of the record as well as for the development of a routine to maintain the record in more up-to-date form.

Interviews were conducted with large users of HF and VHF private systems, such as federal government departments and some outside industry to determine their reasons for operating private systems. The common carriers were interviewed as well, to ascertain their views on private systems and what possible impact their use may be having on common carrier growth and development.

On the basis of the information obtained from the large users, it appears unlikely that many of their special requirements will ever be met by the common carriers. This conclusion does not necessarily infer that the common carriers should attempt to meet these requirements since in many cases private systems seem ideally suited to meet the need in the most economical and efficient manner. The study does not conclude that

.../2

there is any proliferation of private radio systems in the North, to the extent that it may be inhibiting the growth and development of the common carrier network. This conclusion was supported in discussions with the representatives of CNT and Bell Canada who both expressed the view that private HF and VHF systems play an important role in Northern communications by meeting particular needs in the most economical and efficient manner. The study did not indicate any significant proliferation of private radio systems in the North by the large users.

It was found impractical to conduct interviews with the small user due to the large number of individuals involved. Furthermore, the great majority of small users operate at only one location and do not pose the same threat to the common carriers as the large users who may require a type of network operation for intercommunication among several locations. Should there exist any excessive use of private systems by small users it would seem to be a relatively simple matter to control such excesses through the introduction of closer screening procedures for processing licence applications.

Although the study was directed toward private radio system usage it was necessary to explore common carrier service within the study area to determine the extent of impact between the two, i.e. private and common carrier service. It was found that 92.7% of the total population North of 60° latitude could be classified as being well served. For the purposes of this report a community was classified as being well served when the service available comprised a telephone exchange operating 24 hours per day, seven days per week, having connection to the national network over transmission facilities superior to HF radio. Despite the high percentage of the population which were classified as being well served, there remains 29 communities, each having a population over 25, which were classified as being not well served.

.../3

In summary it appears that the great majority of private systems in the North are meeting particular needs and are providing the required service more efficiently and economically than can be done by common carrier. The existing level of private system usage does not appear to be inhibiting the growth of common carrier facilities to any significant extent.

It is suggested that the HF and VHF licensing procedure be revised to include a reduced version of the socio-economic brief as required in the application procedure for microwave systems. This should preclude the licensing of unnecessary systems as well as eliminate existing ones on their licence renewal dates.

In conclusion it seems that there may have existed some undue concern relative to excessive use of HF and VHF in the North and its impact on the development of adequate facilities by the common carriers. While there may be some small degree of excessive use it does not seem to be significant and could be rectified by relatively minor changes to the licensing procedure. The changes should also incorporate provisions for the maintenance of more accurate and informative licensing records.

.../4

2. GENERAL

Over the past several years, considerable effort has been directed by various government departments toward solving the problem of providing adequate telecommunications facilities in the Canadian North, in particular that region lying North of 60° latitude. The thought has been expressed that a proliferation of HF and VHF private radio systems might be inhibiting to some extent, the growth and development of facilities by the common carriers. Should such be the case, it is obvious that a radio system licensing policy should be developed which in effect, would result in the most beneficial combination of common carrier and private system facilities.

In light of this thinking it was decided that a comprehensive inventory of private radio systems in the North should be made as the first step in establishing the "What is" situation relative to Northern telecommunications. Earlier some consideration was given to directing the efforts of a consultant toward developing and recommending an optimum network design utilizing a combination of satellite and microwave facilities. This thinking was discarded in favour of first completing an inventory of all existing private systems North of 60° latitude. The thought being that analysis of the data provided by the inventory should be of assistance in formulating a satisfactory licensing policy governing private HF and VHF radio systems.

.../5

3. INVENTORY

Preparation of the inventory was undertaken, using as source data, computer print-outs of frequency assignment lists as provided by the DOC radio licensing group. Special print-outs were obtained showing all HF and VHF frequency assignments for the area North of 60° latitude. The print-outs were provided in the following formats:

(a) HF assignments by location code.
(b) HF assignments by customer code.
(c) VHF assignments by location code.
(d) VHF assignments by customer code.

Information on the print-outs relative to customer name and location is shown in coded form and reference to other records was required for decoding. The print-out data also included information relative to the type of service, frequency, power and hours of service, etc.

The basic inventory has now been completed and the data has been documented in the following form: (see attachment 1)

(a) The names of all locations at which HF and/or VHF frequencies have been assigned together with the name or names of the licensees at each location and the number of assignments to each licensee.
(b) The names of all licensees to which HF and/or VHF frequencies have been assigned together with the name or names of the locations at which each licensee operates and the number of assignments at each location.

.../6

4. APPROACH

Earlier thinking relative to the information that might be provided by a study of private system usage, tended toward the idea that it should be possible to determine the overall traffic pattern of radio system usage in the North, in a somewhat similar manner to that which is readily available on a common carrier inter-toll network. Traffic patterns of this type depict the volume of traffic over each trunk route as a whole but do not identify either the calling or called parties. In the case of private systems the requirement for telecommunications is largely internal and in many cases entails a requirement for some degree of networking within a company organization or government agency. Usually this requirement is limited to a specific geographic area covering many locations where no settlements exist or are even likely to exist. Each private system represents an entity independent of other private systems and the need for intercommunications between such private systems appears to be minimal. In consideration of this reasoning, it was decided to abandon any attempt to identify any overall traffic pattern for private radio system usage but rather to place the emphasis on determining the number of private systems, where they are, who owns them and for what purpose.

The requirement for telecommunications between the major communities in the North is being fairly well met by the existing common carrier network. In many cases, however, this network does not meet the needs of those who must communicate with truly remot. locations.

.../7

5. COMMUNITIES AND POPULATION

The frequency assignment lists identify 560 location names North of 60° latitude at which frequency assignments have been made. The latest available census data (1971) shows a total of only 125 locations in the same area, 38 of which range in population from 1 to 25 inhabitants.

The disparity between the two records, i.e., 125 versus 560 is largely explained by the fact that many licensees assign a non-official name for otherwise unidentified locations. The non-official names are provided to simplify operations within an organization and in a great many cases are used on licence applications. Many other locations are covered in blanket form such as Baffin Island, Beaufort Sea, MacKenzie Delta or Southampton Island. In such cases, the location is identified by geographic coordinates only.

The population figures and its distribution also were obtained from the 1971 census records. While these figures no doubt will have changed to some extent since the date of the census, it was felt that any changes will not have been sufficiently radical to have altered the overall pattern of telecommunications requirements. It is expected that the problems of 1971 remain as the problems of 1975, the only change being one of magnitude.

The 1971 census data are summarized as follows:

Northwest Territories	Population
80 Communities	34,043
Transients	530
Yukon	
45 Communities	17,260
Transients	1,128
Total population	52,961

.../8

6. DISTRIBUTION OF FREQUENCY ASSIGNMENTS

The frequency assignment lists as prepared by the licensing group contain a large variety of services such as air beacons, marine stations, microwave repeaters and mobile telephone, etc. This type of assignment does not bear on the problem to which this study is addressed since they represent essential services which of necessity will continue to operate within the HF and VHF spectrum. In order to obtain a more accurate count of the total number of assignments in those categories of service which it is considered necessary to review, the total assignments were reduced by the number representing the obvious essential services mentioned above. Following is the result of this reduction:

Total HF and VHF assignments	10,379
Total Air Beacon etc. assignments	1,780
Total assignments to be studied	9,599

The 9,599 frequency assignments are made to 560 locations North of 60^{o} latitude. Of the 560 locations, only 125 can be identified by an official name, the remaining 435 locations are identified only as geographic coordinates or by unofficial names. Of the 125 locations, 57 are classified as being well served by common carrier facilities, according to an arbitrary definition of service as later described under the section entitled, Level of Service.

A list of the 57 well served communities together with the names of all HF and VHF licensees at these communities is contained in (Attachment 2). A still further breakdown showing the major users of private systems is contained in (Attachment 3). It is of interest to note that government departments and agencies account for 48.6% of the major user assignments at the 57 well served communities.

.../9

In the great majority of cases, the frequency assignment listings do not identify any specific reception point for an assigned transmitting frequency. It is assumed in these cases that the service is intended for zone coverage rather than for a point-to-point system. However, out of the 3035 total assignments at well served locations, 576 are indicated as transmitting to other well served locations. These would appear to be cases for further investigation to determine whether or not they represent unnecessary duplication of common carrier facilities. Details of all assignments of this nature are contained in (Attachment 4).

.../10

7. LEVEL OF SERVICE

Although this study is directed primarily toward HF and VHF radio usage, it is suspected that such usage is closely related to the level or status of common carrier service in the study area. It is important, therefore, to attempt to evaluate the grade of common carrier service now provided in the study area and to assess the extent it interacts with the service provided by private radio systems.

With this objective in mind, it was decided to establish a set of arbitrary standards by which Northern communities could be classified as being either well served or not well served relative to telecommunications service. For the purpose of this report, a well served community is one provided with telecommunication service as follows:

(a) A local telephone exchange which provides local telephone subscriber service to the community on a full time basis i.e., twenty four hours per day, seven days per week.

(b) The local exchange and its subscribers to have access to the national inter-toll network over high quality transmission facilities such as satellite, microwave or open wire, in effect any facility rated as being superior to HF radio in reliability and quality of transmission.

Communities not meeting these standards to be classified as not well served. Through application of the above criteria together with a further limiting factor of considering only those communities with a population of 25 or over, it was possible to arrive at a broad measure of the grade of service now being provided by the common carriers within the study area. Details of this classification are contained in Attachment 5 and are summarized as follows:

Communities Over 25	Well Served	Not Well Served
86	57 (66.3%)	29 (34.7%)

Computed by population the results were:

Population	Well Served	Not Well Served
50,867	47.147 (92.7%)	3,720 (7.3%)

A more comprehensive summary of all identifiable communities in the study area, regardless of population, is contained in (Attachment 5). This summary provides data on population, grade of service and the serving agency.

.../12

8. REASONS FOR PRIVATE RADIO SYSTEMS

Short of some form of direct customer contact or interview it is difficult to state authoritatively the reason or reasons for HF and VHF private radio system operations in the North and to determine whether or not there does exist a proliferation of these systems to an extent detrimental to the orderly development of Northern communications. Some of the reasons for the private system users choosing to retain this type of facility in preference to using common carrier facilities, when it is available, are assumed to be as follows:

(a) Cost of common carrier service prohibitive.

(b) Private systems permit communication with points not served by common carrier.

(c) Private systems more portable thus providing greater flexibility than common carrier.

(d) Private system permits establishment of network among both well served and not well served locations. Impractical to meet such a requirement using a combination of private and common carrier facilities.

(e) Common carrier does not meet requirement for instantaneous connection.

(f) Common carrier, in some cases, does not provide service superior to that of private system.

(g) Common carrier does not permit full control of communications for operations where full control is a requirement.

(h) Common carrier does not provide for a gossip network as required by some native groups.

(i) Recently installed common carrier systems do not, in some cases, permit existing private systems to be fully amortized.

.../13

9. INTERVIEWS

As stated earlier it was felt that direct customer contact was required to confirm any assumptions that might be made from study and analysis of the inventory data. It was decided also that the common carriers should be interviewed to ascertain their views relative to the licensing of private radio systems in their respective operating territories North of 60^{o}.

Customer interviews were carried out with a group of major users consisting of:

Ministry of Transport
Royal Canadian Mounted Police
Imperial Oil Company Limited

It was not considered necessary to interview the small individual user group since the great majority of small users operate at only one or two locations and therefore are not inclined to develop a network type of operation.

CNT and Bell Canada were interviewed as representing the common carriers in the study area.

Results of these interviews are summarized as follows:

.../14

Ministry of Transport

An interview was held with Messrs. Murphy, Sawyer and Wilson of MOT to review and discuss the role of private radio systems in MOT's operation. Early in this interview it was identified that the inventory data obtained from the most recent frequency assignment lists varied significantly from the actual situation. The wide variation was due chiefly to failure correct the record for discontinued systems with the result that many more systems are shown than actually exist. Despite the wide discrepancy, however, the MOT are heavy users of private systems and it is expected this situation will continue for considerable time.

Due to the nature of the MOT telecommunications traffic operations, relative to aircraft guidance, it is essential that all communications facilities be maintained at a very high level of reliability. At many locations served by common carrier where no alternate routing facility is available, it is MOT's practice to provide its own back-up facility over HF or VHF private facilities. Such facilities meet the requirement for immediate availability and can be provided at minimum cost since they can be maintained and operated by the regular technical staff at MOT stations. The capital cost of a Single Sideband radio terminal is estimated to be in the order of $8000.

It is not MOT policy to employ private radio system trunks or networks dedicated to administrative traffic. It is the department's policy to utilize common carrier facilities for administrative work wherever possible and to switch to such facilities as they become available. Some exceptions to this policy exist where the cost of the facility becomes prohibitive as in the case of long haul full time service over the ANIK satellite.

Obviously there will be a continuing heavy demand by the MOT for HF and VHF private radio systems but the current policy being followed by the department should not lead to any excessive use of this type of service.

.../16

Royal Canadian Mounted Police

Similarly as with the MOT, the licensing records are at wide variance with the actual situation and indicate a significantly larger number of assignments to the RCMP than actually exist. It becomes obvious that whatever system is employed for maintaining the record of frequency assignments is not fulfilling its purpose.

Inspector I.M. Saunders of the RCMP states that the major application of HF and VHF radio facilities in the police operation is to maintain working contact with their vehicles. All telephone service between well served locations is conducted over common carrier facilities. Hard copy such as teleprinter and facsimile is also transmitted over common carrier. In a number of cases a well served location serves as a hub for a group of not well served locations from which are operated several RCMP vehicles. In these cases VHF is utilized to maintain contact with the vehicles from the hub and common carrier is used between hubs as required to form a type of network operation.

The RCMP is now committed to participate with the Northwest Territorial Government in the establishment of a private network, utilizing common carrier trunk facilities, which will parallel the Yukon and Dempster highways. Here again the primary purpose of the system will be to meet the mobile requirements of the participants which are not available from the common carrier.

Inspector Saunders states that the policy of the RCMP is to switch to common carrier facilities as they become available and are capable of meeting the special requirements of the policing activity. It must be recognized, however, that there will be a continuing requirement

.../17

for some private systems due to the need for maintaining contact with remote communities and locations where it is unlikely that the common carrier will serve for many years to come.

In general, it may be stated that the current use of private radio systems by the RCMP is compatible with efficient use of the spectrum and does not inhibit the development of Northern service by the common carriers. However, there will be a continuing need for extensive use of HF and VHF private facilities to meet the mobility requirement which forms a large part of the RCMP telecommunications need in the North.

.../18

Imperial Oil Company Limited

Mr. F.A. Hanning, Manager, Communications - Imperial Oil Ltd. was interviewed regarding their extensive use of private HF and VHF radio systems North of 60° latitude. The licensing records indicate 310 HF and 410 VHF assignments to Imperial Oil in this area. It should be noted that this figure does not represent 728 different frequencies since one frequency may be used at several locations.

There is reason to suspect that the record may be in considerable error on the high side, particularly in respect to HF assignments, since a significant reduction has occurred in the past three to five years. This reduction has been brought about through the continued extension of common carrier microwave systems throughout the territory by Canadian National Telecommunications.

Imperial Oil Co. policy in respect to Northern Telecommunications is to utilize common carrier facilities wherever and whenever they become available and are competitive with private system operation. The one type of facility quoted as being non-competitive for long haul dedicated circuitry was the ANIK satellite.

Imperial Oil's activity in the North lies in remote locations away from established communities. A rough estimate of the personnel at these locations would be in the order of four to five hundred. It is essential that contact be maintained with these people on a twenty four hour basis for safety reasons as well as for the transmission of data relative to operational and exploratory activities.

To meet the communications requirement it is Imperial Oil's practice to utilize common carrier facilities to the closest point to a

specific activity and extend communications to such remote operating locations by private system, employing UHF, VHF and HF facilities as may be required. The non-permanent nature of these activities, which are subject to relocation two to three times a year, make it impractical to provide the required service through use of common carrier facilities.

A further activity entailing extensive use of private radio systems is that of collecting environmental data. Imperial Oil maintain in excess of one hundred unattended remote locations at which are located sensing devices. The majority of the devices are located in abandoned drill holes or on the ice of the Beaufort Sea. The devices are polled several times each day over private radio systems operating from Munik.

Mr. Hanning does not foresee any decrease in the use of VHF private radio systems to meet their particular needs in remote Northern locations where it is essential to have high quality, reliable facilities for voice and data transmission. Should any such locations develop to the point where it would be economically viable for a common carrier to operate, there would be no hesitation on the part of Imperial Oil to switch to common carrier facilities.

The annual total cost for telecommunications in the North to Imperial Oil, including capital depreciation, operations, maintenance and tolls to the common carriers is in the order of one million dollars.

In general, it may be stated that the current situation in respect to Imperial Oil's communications is not inhibiting the growth of the common carrier network in any way. This thinking is further supported as covered in this report under interviews with CNT and Bell Canada.

.../20

Canadian National Telecommunications

An interview was held with Mr. D.W. Bruce and W.R. Rankin of CNT to ascertain their views relative to private radio system usage within CNT operating territory in the Yukon and Northwest Territories.

In total the CNT do not see that private radio systems have had any significant effect on the growth and development of their common carrier facilities in the North. CNT does not think any restrictive measures, other than those already existing, should be applied to HF licensing procedures. In respect to VHF, however, it is possible that some further restraint should be applied to preclude the use of private VHF systems for trunk facilities between well served locations. While there is no specific evidence that this is common practice, the possibility does exist under current licensing procedure.

Mr. Bruce states it is their experience that where and when reliable common carrier facilities become available in areas served by private systems, the private system users switch to common carrier. It is recognized, however, that in a great number of cases the communication requirements of a particular customer can be served more efficiently and economically by a private radio system.

CNT concur with the RCMP policy relative to the use of private VHF systems to meet their mobility requirements at remote locations and the interconnection of the hub locations by means of common carrier trunk facilities. The proposed private network to serve government departments and agencies in the N.W.T. and the Yukon is an example of private systems linked together over dedicated trunk facilities, provided by CNT, that illustrates an efficient combination of private and common carrier facilities.

.../21

Bell Canada

Interviews were held with Messrs. Coleman and Dempsey of Bell Canada to ascertain Bell's views on the role of private HF and VHF radio systems in their operating territory North of 60° latitude.

Bell does not assume any automatic stance against licensing private systems within their territory. In actual fact they frequently recommend to a customer, at a remote location, who requires communication with the national network, that he purchase an HF system and make application to operate it on frequencies assigned to Bell Canada, for communication with the closest toll center. Due to the remoteness of many such locations, the owner is in better position to provide his own maintenance which may be available only by air transportation.

Bell also supports the use of private HF systems for local "gossip" networks among very small remote communities having common interests. In these cases, however, the systems should apply for separate frequency assignments for network operating and utilize Bell assignments when connecting with a toll center for communication to the outside.

The use of private VHF systems for trunking between well served communities is not favored unless it appears essential for back-up service when alternate routes are not available from the common carrier. Bell Canada, of course, feels strongly that greater use should be made of satellite facilities, by government agencies, in the general interests of making the satellite operation more economically usable.

In total, however, Bell does not feel that HF and VHF private systems are handicapping the growth of their common carrier network in the North. It is Bell's opinion that private systems are serving a useful

.../22

purpose and there will be a continuing requirement for their use in meeting special requirements. Adequate screening of licence applications should be employed to ensure against proliferation, particularly in the VHF spectrum.

.../23

10. CONCLUSIONS

From analysis of the inventory data and following interviews with the common carriers and major users it is possible to arrive at some well substantiated conclusions as follows:

1. There is no substantial evidence to support the view that there is excessive use of private HF and VHF radio systems to the extent that it is affecting the development of an adequate common carrier network in the Canadian North.

2. There will be a continuing heavy demand for private radio systems by both industry and government departments to meet needs peculiar to their respective requirements in remote Northern locations.

3. There may exist some excessive use of private radio systems between well served locations. This condition could be readily corrected through relatively minor changes to the licensing application procedure.

4. There is a requirement for the common carriers to provide improved service to a number of large communities North of 60^{o} latitude.

5. The frequency assignment lists are in urgent need of purification and better procedures are required in order to maintain the records in accurate form.

6. There should be a regular continuing liaison between representatives of DOC, major users and the common carriers to ensure that Northern communications needs are provided in the most efficient manner consistent with economic restraints.

ATTACHMENT # 2

HF AND VHF USERS AT WELL SERVED LOCATIONS

CLASS OF SERVICE SYMBOLS

AL --- Aeronautical radionavigation land station.

AM --- Aeronautical radionavigation mobile station.

BC --- Broadcast station - Sound.

BT --- Broadcast station - Television.

CO --- Station open to official sorrespondence exclusively.

CP --- Station open to public correspondence.

CV --- Station open exclusively to correspondence of private agency.

EX --- Experimental station.

FA --- Aeronautical station.

FB --- Base station.

FC --- Coast station.

FX --- Fixed station.

ML --- Land mobile station.

OT --- Station open exclusively to operational traffic of service concerned.

RC --- Non-directional radio beacon.
