## Ordering and subscription information

This product, Catalogue no. 15-001-XIE, is published monthly in electronic format on the Statistics Canada Internet site at a price of CDN \$11.00 per issue and CDN \$110.00 for a one-year subscription. To obtain single issues or to subscribe visit our Web site at [www.statcan.ca](http://www.statcan.ca), and select Products and Services.

This product is also available in print through a Print-on-Demand service, at a price of CDN \$58.00 per issue and CDN \$230.00 for a one-year subscription. The following additional shipping charges apply for delivery outside Canada:

	<b>Single issue</b>	<b>Annual subscription</b>
<b>United States</b>	CDN \$ 6.00	CDN \$72.00
<b>Other countries</b>	CDN \$ 10.00	CDN \$120.00

All prices exclude sales taxes.

The printed version can be ordered by

- Phone (Canada and United States) **1 800 267-6677**
  - Fax (Canada and United States) **1 877 287-4369**
  - E-mail **order@statcan.ca**
  - Mail

### Revisions

This issue of 15-001-XIE contains revised estimates of Gross Domestic Product by industry back to January 1999.

### Note to users:

The gross domestic product (GDP) of an industry is the value added by labour and capital in transforming inputs purchased from other producers into outputs. Monthly GDP by industry is valued at 1992 prices. The estimates presented here are seasonally adjusted at annual rates.

This publication was prepared under the direction of:

Industry Measures and Analysis Division

**R. Pagnutti**, Assistant Director,  
Industry Measures and Analysis Division

**R. Evans**, Chief,  
Monthly GDP Section

## The System of National Accounts

In Canada, the National Accounts have been developed since the close of the Second World War in a series of publications relating to their constituent parts. These have now reached a stage of evolution where they can be termed a "System of National Accounts". For purposes of identification, all publications (containing tables of statistics, descriptions of conceptual frameworks and descriptions of sources and methods) which make up this System carry the term "System of National Accounts" as a general title.

The System of National Accounts in Canada consists of several parts. The annual and quarterly Income and Expenditure Accounts (included with Catalogue Nos. carrying the prefix 13) were, historically speaking, the first set of statistics to be referred to with the title "National Accounts" (National Accounts, Income and Expenditure). The Balance of International Payments data (Catalogue Nos. with prefix 67), are also part of the System of National Accounts and they, in fact, pre-date the Income and Expenditure Accounts.

Greatly expanded structural detail on industries and on goods and services is portrayed in the Input-Output Tables of the System (Catalogue Nos. with prefix 15). The Catalogue Nos. carrying the prefix 15 also provide measures of the contribution of each industry to total Gross Domestic Product at factor cost as well as Productivity Measures.

Both the Input-Output tables and the estimates of Gross Domestic Product by Industry use the establishment as the primary unit of industrial production. Measures of financial transactions are provided by the Financial Flow Accounts (Catalogue Nos. with prefix 13). Types of lenders and financial instruments are the primary detail in these statistics and the legal entity is the main unit of classification of transactors. Balance sheets of outstanding assets and liabilities are published annually.

The System of National Accounts provides an overall conceptually integrated framework in which the various parts can be considered as interrelated sub-systems. At present, direct comparisons amongst those parts which use the establishment as the basic unit and those which use the legal entity can be carried out only at highly aggregated levels of data. However, Statistics Canada is continuing research on enterprise company establishment relationships; it may eventually be feasible to reclassify the data which are on one basis (say the establishment basis) to correspond to the units employed on another (the company or the enterprise basis).

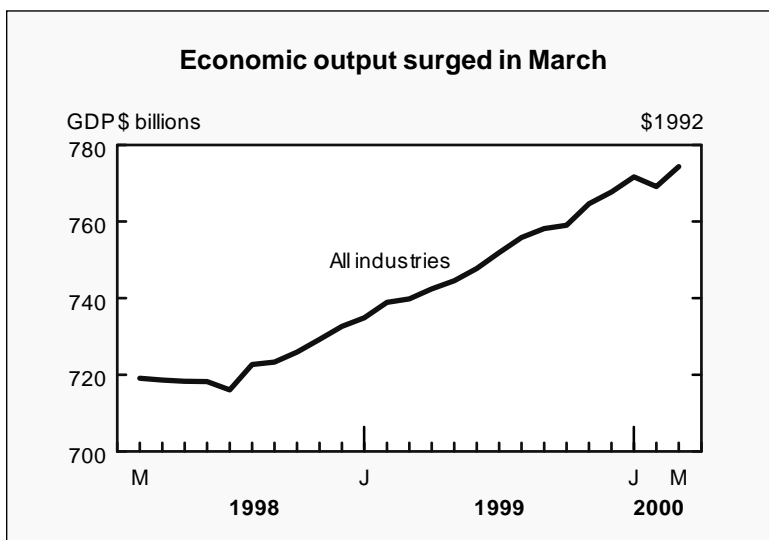

In its broad outline, the Canadian System of National Accounts bears a close relationship to the international standard as described in System of National Accounts, 1993, a joint publication of the Commission of the Euro-pean Communities, International Monetary Fund, Organization for Economic Co-operation and development, United Nations and World Bank.

## Highlights

### March 2000

Gross domestic product (GDP) rose 0.7% in March after receding in February, capping a robust first quarter. The advance marked a return to the solid growth path that had seen economic output rise in each of the previous eighteen months.

There were advances in all of the economy's main industrial sectors, with the exception of utilities and health services. Manufacturing accounted for about two-fifths of the overall March progression. Retailers, wholesalers and construction companies all recovered from setbacks in February. Transportation firms benefited from the general increase in economic activity, while business and financial services also advanced. From a quarterly perspective, strong growth in the finance, manufacturing, retail and construction industries contributed to a solid advance in the January-to-March period.

### Manufacturing output advanced in March

After slumping 1.7% in February, manufacturers raised output by 1.6% in March, paralleling a resurgence in export demand. The broadly-based increase in output was led by the transportation equipment, fabricated metal and printing & publishing industries. Overall, 19 of 22 major industry groups, accounting for over 95% of total manufacturing production, advanced in March. The most significant decline in output was in the other miscellaneous manufacturing industry.

The transportation equipment industry was buoyed by increased automotive production, as makers of cars and parts raised output by 3.4% in March. However, the increase still left output in this industry short of the levels reached in January. Parts & components makers accounted for about three-quarters of the increase, led by manufacturers of plastic parts, engines and other accessories.

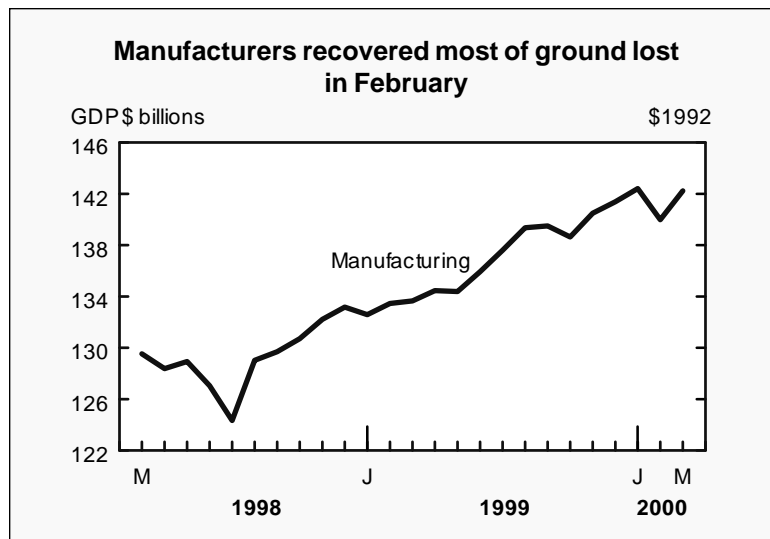

Producers of fabricated metal products raised output by 3.0% in March, partly recovering from the previous month's sharp decline. The broadly based increase – the fifth in six months – was spearheaded by higher output of fabricated metal structures, machined metal parts, heating equipment and power boilers.

The printing & publishing (+3.0%), wood products (+2.8%) and furniture (+4.6%) industries rebounded in March from February setbacks. Success in these industries in recent months resulted from the end of a strike by publishing industry workers and a booming housing market.

Makers of electrical & electronic products raised output by 1.3% in March. Factories producing computers and peripherals increased output sharply, halting a downtrend that had set in during the previous five months. Higher output of electronic parts & components and communications wire & cable was also reported in March. However, telecommunications equipment manufacturers, long the industry stalwarts, curtailed production slightly in March.

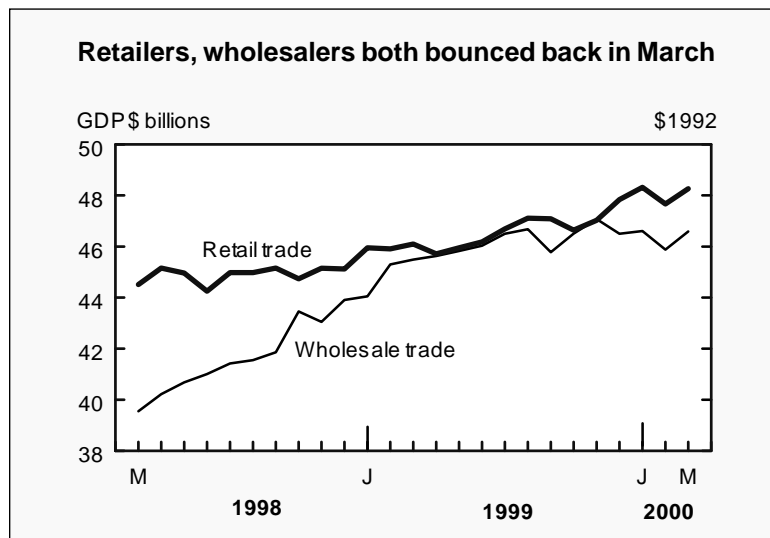

Some of the most significant declines in March were among manufacturers of miscellaneous goods, where output fell 1.6%. Output in this industry group was almost uniformly down, with makers of sporting goods, musical instruments and jewelry most affected.

### Recovery in retailing, wholesaling

Consumers were back in the stores in March, as retail sales activity bounced back 1.3% from a disappointing February. Higher auto sales deserved most of the credit; excluding this key component, sales showed a muted gain. Higher auto sales (with the monthly increase being concentrated in cars, bucking a recent preference for trucks) meant that dealers made up for most of the previous month's loss. Increased sales were also reported by auto parts and furniture stores, while service stations reported a drop in activity.

Wholesaling activity rose 1.5% in March, as a broadly-based increase retraced a similar-sized drop in February. Wholesale sales of farm machinery, which had plummeted in February to their lowest levels in over six years, returned to January levels in March. Sellers of lumber & other building materials also raised output after a weak February, mirroring a pickup in construction activity. Computer & software distribution advanced modestly, continuing the slower pace of sales after having peaked last July. Wholesaling of non-farm machinery continued to be on an upswing, building on 1999's steady gains. These increases were partly offset by a decline in activity by fuel dealers, the third in four months.

### Healthy construction sector buttressed by continued housing buildup

After slipping in February, construction activity resumed its upward course in March, rising 1.0%. Increased homebuilding accounted for most of the overall gain in output. The construction of non-residential buildings (commercial, industrial and institutional structures) also advanced, but at a lesser pace than in previous months.

### Transportation industries benefited from higher industrial activity

The increased movement of goods spurred the transportation sector to raise output by 1.4% in March. The increase benefited trucking firms the most, although rail and shipping companies also enjoyed an increase in business. Output in the air transportation industry was steady in March.

### Mining output began to show signs of slowing

Growth in the mining industries continued to moderate in March, after a steep oil-price induced climb in the latter half of 1999. March's 0.4% advance resulted primarily from another increase in drilling & rigging activity (the tenth gain in eleven months). Scheduled maintenance shutdowns forced the output of crude petroleum & natural gas lower, and metal mining also fell. Output of potash, however, surged, buoyed by record shipments abroad, particularly to China.

## **Warmer March weather sapped utilities**

After two months of higher demand, unseasonably warmer March temperatures reduced heating needs and led to a 4.4% drop of utilities' production. Electric power generation and gas distribution both fell, with the bulk of the decline coming from lower heating-related commercial and residential needs.

## **Other industries**

A healthy housing market led to a sharp increase in the real estate agents' services in March. The finance industries had another busy month, buoyed by continued record stock market activity. Business services rose 0.6% as increased activity in miscellaneous and accounting & legal business services more than offset a decline in computer consulting. The decline in the latter was the first in three years, and was partly due to layoffs following the end of year 2000-related contracts. There was a minor decline in health and social services.

## First Quarter 2000

### Overview

Gross Domestic Product (GDP) grew 1.0% in the first quarter of 2000, following advances of 1.4% and 1.1% in the previous two quarters.

Output in the finance industries surged, lifted by record levels of stock market activity. Manufacturers experienced moderate output growth in the year's first quarter, matching the previous quarter's performance. Construction activity continued to grow at a rapid pace. Retailers were ringing in higher sales in the first quarter after ending the previous year on a disappointing note; the same could not be said of wholesalers, however, where lacklustre computer sales contributed to producing the first negative quarter of growth in two years. However, business and communications service providers had a good quarter, while utilities' output responded positively to the onset of generally colder weather during the latest three-month period.

### Increase in activity at stock exchanges translated into strong quarter for finance industries

Feverish activity on Canadian stock exchanges, which saw the TSE 300 composite index advance 43.4% over the first quarter of 1999 as trading volumes doubled over last year's levels, spurred the finance industries to a 3.7% advance in the first quarter of 2000.

### Steady pace of manufacturing growth continued

Total factory output advanced 1.0% in the latest quarter, matching the previous quarter's pace, but a far cry from the third quarter's auto-driven 2.9% surge. Increases were focussed in the manufacturing of electrical & electronic products, machinery, fabricated metal and wood products. These gains found a partial offset in lower production of textiles, paper & allied products and food. Overall, thirteen of twenty-two major manufacturing groups, which accounted for almost 65% of total factory output, increased production.

Plants making electrical & electronic equipment raised output 3.4% in the latest quarter. However, this was short of the pace set during most of 1999. The main factor behind the quarter's slower advance was a sharp break in pace for manufacturers of telecommunications equipment which, after four consecutive quarters of double-digit growth, raised output by a comparatively modest 2.6% in the latest three-month period. Output of electronic parts & components, other electrical & electronic goods and computers & peripherals also increased, partly offset by decline in the production of small & major appliances.

The latest quarter was also marked by a 6.9% increase in the manufacture of machinery, the first significant gain for this industry in over ten quarters. Pronounced increases in the fabrication of construction and mining machinery – mirroring the recent pickup in activity in building and oil & gas extraction – contributed significantly to the hefty increase, while production of compressors & heat exchangers and miscellaneous machinery also increased.

Output of wood products rose 3.4% in the first quarter. There were sizeable production increases of windows, doors & other millwork as construction demand continued to stimulate output. Even sawmills (which have been subject to quota restrictions imposed by the Canada-US Softwood Lumber Agreement) raised output during the quarter in response to a booming domestic homebuilding industry, exports being flat.

Production of fabricated metal products rose 2.0% in the first quarter. Surging export demand for machined parts and the booming construction industry's need for structural metal and wire products kept factories humming.

Output of transportation equipment rose 0.6% in the latest three-month period. First-quarter production of autos & parts partly recovered from a fourth-quarter decline, but output in the auto industry remained below the high production levels that were achieved in the third quarter of 1999.

Factories making primary textile products curtailed production by 10.6% in the first quarter. The lion's share of the decline was caused by a plant closure in the synthetic fibre industry, but production also fell significantly in the spun and woven cloth industry.

Food production fell off 0.5% in the first quarter, after a build-up in production in the latter half of 1999. Manufacturers of dairy products, fish products, biscuits and tea & coffee all curtailed output in the latest three-month period. These declines were partly offset by the increased production of bakeries and confectionaries.

### **Construction boom showed no sign of letting up**

The boom in construction activity showed no sign of abating in the January-to-March period, as the building of all types of structures rose 2.4%, after gaining 2.8% in the previous quarter. Homebuilding activity advanced for a second consecutive quarter. Most of the quarter's gain was attributable to the single-detached component, as the more volatile multiples component was essentially flat. Activity on non-residential structures such as industrial, commercial and institutional buildings accelerated during the quarter, while work on engineering and repair projects continued to show robust growth.

### **Higher auto sales led to retail rebound**

Shored up by higher auto sales, retailing activity rose 1.9% in the first quarter, in sharp contrast with the previous quarter's anaemic growth. Auto dealers, which on average account for about one-quarter of total retail sales, were responsible for almost half the increase. Gasoline service stations sales were also up, as were those of general merchandise, furniture & appliance and department stores. A partial offset stemmed from weaker alcohol and food sales (which were soft after strong sales in the closing quarter of 1999), and by lower drug store sales.

### **First quarterly decline in wholesaling in two years**

The strong growth in wholesaling evidenced throughout most of 1999 came to an abrupt halt as activity contracted 0.7% in the first quarter. A drop in the distribution of computers & software, which reached a plateau in the third quarter of 1999 after three years of expansion, was primarily to blame for the decline. However, a sharp fall in the wholesaling of food, hurt by a temporary decline in demand in the wake of the Year 2000 switchover, and a return to negative growth for farm machinery distributors, also contributed. Increased sales activity of non-farm machinery, miscellaneous equipment & parts and automotive products partly offset these declines.

## **Oil prices continued to boost mining production**

Mining output rose for the third consecutive quarter, rising 2.3%. Higher oil & gas prices continued to underpin the sector's growth, production of crude petroleum and natural gas accelerating significantly, although growth in drilling & rigging activity moderated.

These gains were partly offset by sinking production in the metal mine industries, which fell after showing a burst of strength in the previous quarter, on lower output of both gold and other metals (such copper, nickel and zinc). Output of potash was up sharply for a second consecutive quarter, mostly on higher demand from China.

## **Other industries**

Business service providers generally experienced healthy demand in the first quarter, although computer consulting showed signs of moderating in the wake of the year 2000 switchover. The communications services industry advanced briskly, led by increased activity among telecommunication carriers. Electrical and gas utilities enjoyed a 2.2% quarterly gain in output in the first quarter, stimulated by the arrival of more seasonable temperatures after an unusually warm end to 1999 had depressed heating-related demand.

\* Data not available after 1994.

\*\* For some of the lowest level of aggregation, it is not possible to have an homogeneous series from 1961 to the present. For that reason, special industry groupings that provide relatively good continuity were created back to 1961.

## Appendix IIa - GDP by Industry: Overview

### 1. Gross Domestic Product by Industry at Factor Cost, at Constant Prices

#### Definition

Gross Domestic Product by industry at factor cost (GDP) is a measure of the economic production which takes place within the geographical boundaries of Canada. As the name suggests, it is designed to show the industrial distribution of total output. GDP for a single industry is also referred to as net output, or value added. Conceptually it is equal to the total value of production by the industry (gross output) less the value of inputs purchased from other industries or imported (intermediate inputs). Primary factors of production, such as labour and capital, produce gross output by adding value to the intermediate inputs. Value added can therefore also be derived as the remuneration to the primary factors of production, that is as the sum of labour income, depreciation, and profits. GDP for the economy as a whole is the sum of net output, or value added, for all industries. Summing net rather than gross outputs avoids double counting the output of one industry which is an intermediate input to another.

The term "gross" in Gross Domestic Product means that capital consumption costs, that is the costs associated with the depletion of capital assets (buildings, machinery and equipment), are included. The expression "at factor cost" means that production is valued at the cost of production rather than at market prices, which include indirect taxes but exclude subsidies. GDP valued at "factor cost" excludes indirect taxes but includes subsidies.

"Constant prices" means that the estimates are valued at the prices that prevailed in some base year rather than those of the current year. As a result changes in the estimates of value added by industry reflect changes in the physical volume of production, and do not reflect changes that are simply due to price fluctuations. With this publication, the base year for constant price estimates is 1992.

### 2. Differences Between Industry-Based and Expenditure-Based GDP

#### 2.1 Differences in Objectives

The Canadian System of National Accounts (CSNA) publishes two constant dollar subannual measures of Gross Domestic Product: (1) the monthly GDP by industry and (2) the quarterly expenditure-based GDP. Both measures are designed to measure total production in Canada, but serve different analytical purposes. GDP by industry provides information about the sources of output, while the expenditure-based GDP shows the disposition of output among the various categories of final demand. The two series yield similar results, but because of conceptual, statistical and methodological differences, they are not identical.

#### 2.2 Conceptual Differences: Factor Cost and Market Price Valuation

Because expenditure-based GDP is viewed from the perspective of purchasers, the analysis is concerned with final demand categories such as personal expenditure, government expenditure, capital formation, and exports and imports. Output is valued at *market prices*, which reflect what purchasers actually pay for the goods and services. Market price valuation includes indirect taxes such as sales and excise taxes, licences, property taxes, etc., and excludes subsidies.

When the output of goods and services is looked at in terms of the industries which produce them, valuation is confined to the costs incurred in producing the products. Various taxes on expenditure (indirect taxes) are excluded while government subsidies are included. Indirect taxes fall more heavily on some products (for example liquor or tobacco) than on others, and consequently the contribution of specific industries to total GDP is more accurate if such taxes are not taken into consideration. GDP by industry is therefore estimated on a *factor cost* basis.

Whether GDP is calculated by the industry or the expenditure approach, the two totals should in principle be different only in net indirect taxes (indirect taxes less subsidies), but in fact there are some statistical discrepancies as well.

## 2.3 Statistical Differences

The estimates of monthly GDP by industry and the quarterly expenditure-based GDP are built up somewhat independently. The estimates are prepared using various data sources which, in addition to being weighted differently, also result from different estimation methods. For example, the industry based estimates do not rely on data for exports but are based on manufacturers' shipments data. The expenditure-based estimates of GDP use exports, but not shipments. Since exports by manufacturers must have been shipped, both systems will reflect the same underlying activity. However, since they do so via different statistical vehicles, there will be statistical differences between the two systems.

## 3. Methodological Overview: GDP by Industry

### 3.1 Annual Benchmarks

For all but the most recent two years, the annual estimates of Gross Domestic Product by industry are derived within the framework of the Input-Output accounts by subtracting the intermediate inputs from the gross output of industries. The data sources are typically annual surveys or censuses. For the most recent two full years and part of the current year, GDP is estimated using the monthly methodology described below.

### 3.2 Monthly Estimates

On a monthly basis information on industry activity, especially the consumption of inputs, is not as complete as it is annually. As a result, the monthly values of GDP by industry are projections, estimated using proxy indicators such as gross output or employment, usually obtained from monthly surveys (see Appendix IIb). The main assumption inherent in the monthly projector system is that the relationship between inputs and outputs changes slowly enough that it can be regarded as constant over short spans of time. This assumption will be true if both technology and the product mix change slowly. It is therefore more useful for projecting GDP over short time spans than over long ones, and at lower levels of industrial disaggregation, where product mix is relatively homogenous and stable. Prices of inputs and output do not necessarily evolve at the same pace during a given period. As a result, the relationship between inputs and output can be distorted at current prices. For that reason, the assumption above only applies to the calculation of GDP at constant prices.

### 3.3 Benchmarking

This is the process by which monthly estimates are adjusted to the new benchmark levels. Since the monthly estimates are projections, they are adjusted to sum to the annual benchmark levels once they become available. This adjustment is based on a quadratic minimization technique, which preserves the month-to-month movements in the original series as much as possible, subject to the constraint that the monthly estimates sum to the annual benchmarks.

### 3.4 Seasonal Adjustment

To aid interpretation of economic developments the estimates of GDP by industry are seasonally adjusted and are published in both seasonally adjusted and unadjusted forms. Seasonal adjustment removes movements caused by repetitive climatic or institutional events, thereby making the underlying activity more apparent.

The seasonal adjustment technique relies heavily on the use of moving averages, that become less reliable towards the end of the series. To minimize this problem, the series are projected one more year so that the last real data point is 12 months from the end point of the extended series. An ARIMA (autoregressive integrated moving average) model is used for this purpose.

### 3.5 Trading-Day Adjustment

In many monthly economic time series a significant portion of the monthly growth rate is associated with differences in the composition of calendar months. For example, the volume of production usually varies with the different days of the week, and since consecutive months contain different combinations of days, a significant portion of the month-to-month

changes may be caused strictly by the calendar. To give a more precise idea of economic developments, the calendar months are put on an equalized basis. This is done by applying a smoothing procedure, known as trading-day adjustment. Trading-day adjustment alters the distribution of monthly output to reflect changes in production that would occur if all months contained the same number and type of days.

### 3.6 Rebasing

In order to analyse the behaviour of GDP independently of the influence of price changes, GDP is calculated for each industry in constant prices. In loose terms, constant price measures inform about the volume of goods and services produced, independently of changes in prices. Such series are calculated by choosing a reference period in the past, called the base year, and valuing current production of goods and services in the prices of that year.

The selection of the base year can have significant consequences, as different base years may yield different growth rates in total GDP and other aggregates. Consider an industry whose output price has declined, relative to that of other industries, between two years. The contribution of this industry to total output will be larger when valued in prices of the earlier period since the relative price was larger in that period, and movements in this industry will have more impact on movements in total output. If the industry is growing faster than average, valuing output in prices of the earlier period will result in a total GDP measure that grows faster than it would were output valued in prices of the later period.

A notable example is the computer industry, in which soaring output and accelerating quality changes were combined with rapidly falling prices during the 1986 to 1992 period. In 1986, the computer industry comprised a mere 0.2% of total GDP, and this proportion remained flat in current prices between 1986 and 1992. However, when production was valued in 1986 prices, the industry's contribution to total real GDP rose to 0.6% by 1992. This means that changes in current price output were magnified through deflation, giving enhanced importance to the computer industry in the constant price series.

Ideally the base year is a typical year, followed by a number of years in which the relative prices of commodities remain stable. In a dynamic economy, however, relative prices constantly shift due to such factors as uneven technological developments in different industries, variations in productivity, shifts in consumer demand, cycles in economic growth and so on. The more remote a base year becomes in time, the more today's relative prices will have changed compared to those of the base year, and the less prices of the base year will be relevant for the current period. The usefulness of constant price estimates therefore diminishes as we move away from the base year. The rate of obsolescence depends on the degree of relative price change.

The frequency of rebasing is a compromise between using a more representative reference period and maintaining a stable definition of output for a reasonable length of time. In Canada rebasing has traditionally been done at 10-year intervals: 1961, 1971, and 1981. Since 1986, the rebasing is now done at shorter intervals of five to six years. This conforms to U.N. recommendations regarding the frequency of rebasing.

With the release of the October 1997 data, a new base year was adopted. The year 1992 (previously 1986) became the new base year for the constant dollar estimates. At the same time, the monthly GDP estimates were adjusted to a new set of Input-Output Tables, which were revised to conform more closely to international standards as described in System of National Accounts 1993.

#### Major Changes Introduced by the Historical Revision:

With this historical revision, FISIM (financial intermediation services indirectly measured), an imputation which prescribes that net interest received be used when measuring the banking industry's contribution to GDP, has now been extended to credit unions and trust, mortgage and consumer loan companies.

In the past, banking activities were deconsolidated so that output of banks would only reflect deposit-lending type of activities. Other activities related to brokerage or mutual fund activities were classified in other financial services. When conducted by banks, these activities now remain part of the banking industry.

The "Royalties industry" disappeared and the royalty payments on natural resources are now part of the surplus of the extracting industry. In other words, royalties are considered a return on natural resources or investment income. This will increase the GDP in the mining sector while reducing it in finance, insurance and real estate industries.

General exploration expenses as well as geological and geophysical expenses are now considered capital expenditures. As a result, inputs in the mining sector will be lower, and GDP higher while it will be the opposite in several engineering construction industries.

A large portion of the GDP in gambling operations is considered a "profit" by lottery Corporations. This amount is now considered an indirect tax. As a result, GDP related to gambling operations will be lower.

Also, a new classification, closer to the one proposed by the 1980 SIC was adopted. The classification changes are covered in more detail in the next section.

#### 4. Classification

The industrial classification framework used in the preparation of the monthly GDP estimates follows fairly closely the Standard Industry Classification of 1980 (1980 SIC). At the highest level of aggregation, industries are regrouped in 18 categories which correspond to the "Divisions" of the 1980 SIC. Divisions are identified by a letter and often referred to as a one-digit level.

##### Divisions

- A. Agricultural and related services industries
- B. Fishing and trapping industries
- C. Logging and forestry industries
- D. Mining (including milling), quarrying and oil well industries
- E. Manufacturing industries
- F. Construction industries
- G. Transportation and storage industries
- H. Communication and other utility industries
- I. Wholesale trade industries
- J. Retail trade industries
- K. Finance and insurance industries
- L. Real estate operator and insurance agent industries
- M. Business services industries
- N. Government service industries
- O. Educational service industries
- P. Health and social service industries
- Q. Accommodation, food and beverage service industries
- R. Other service industries

Divisions are further subdivided into three lower levels. The highest one being the major group which is essentially a two-digit level. Food and wood industries are among the 22 major groups that compose manufacturing. Transportation services and pipeline transport also represent major groups. The last two levels correspond mostly to three- and four-digit levels as defined in the 1980 SIC.

In order to provide detail below the two-digit level in certain industries, notably among services producing industries, it was necessary to create new groupings of three- or four-digit industries due to data gaps. Those groupings are identified and defined in Appendix I. The appendix also shows the relationship between the monthly industrial classification system and the worksheet (W) level in the Canadian Input-Output framework from which industry benchmarks are derived.

Monthly GDP estimates are compiled back to 1961. At the lowest level of aggregation of the current industrial classification framework, it is not always possible to have an homogeneous series from 1961 to the present. Data gaps as well as changes in the SIC classifications of 1961, 1971 and 1980 are responsible for this.

With the introduction of a new SIC, establishments are sometimes reclassified from one industry to another. Thus an industry with a similar name in two different SIC's may have a somewhat different composition in terms of establishments.

In some cases the differences will be small, and in others large. In general there is greater such definitional discontinuity at lower levels of industrial dis-aggregation than at higher levels. For some purposes it is useful to have definitional continuity at as low a level of dis-aggregation as possible. For this reason, special industry groupings that provide relatively good continuity were created back to 1961. These groupings are identified with an asterisk (\*\*\*) in Appendix I.

The groupings were determined based on two criteria. Near equality of value added under the new and old definitions was a necessary but not a sufficient criterion. The value added of incoming establishments could be large and nearly equal to the value added of outgoing establishments. In this case, the composition of the industry would have changed substantially while the overall value added would have changed only marginally. As a result, a second criterion was introduced to define continuity: the value added of incoming and outgoing establishments had to be small relative to the total value added before reclassification.

In order to help users monitor economic activity from a global point of view, industrial aggregates in addition to the "division" level have been defined. There are 12 such aggregates including goods producing industries, services producing industries, industrial production and others. They are identified in Appendix I with an industry code prefixed by a "T".

## 5. Dissemination Vehicles

### 5.1 The *Daily*/CANSIM

As with many Statistics Canada series, the monthly estimates of GDP are officially released to the public simultaneously through the Statistics Canada *Daily* Bulletin and CANSIM (Statistics Canada's machine-readable database). The CANSIM database is available on Internet at the following address: [www.statcan.ca](http://www.statcan.ca). The estimates are published approximately 60 days after the end of the reference month. The data are also released in a publication, Catalogue no.15-001-XIE *Gross Domestic Product by Industry*, about a week after the release date. Data can also be obtained directly from the division on diskette, print-out or other.

<u>Reference month</u>	<u>Release dates</u>
August 1999	October 29, 1999
<b>September 1999</b>	<b>November 30, 1999*</b>
October 1999	December 24, 1999
November 1999	January 31, 2000
<b>December 1999</b>	<b>February 28, 2000*</b>
January 2000	March 31, 2000
February 2000	April 28, 2000
<b>March 2000</b>	<b>May 31, 2000*</b>
April 2000	June 30, 2000
May 2000	July 31, 2000
<b>June 2000</b>	<b>August 31, 2000*</b>
July 2000	September 29, 2000
August 2000	October 31, 2000
<b>September 2000</b>	<b>November 30, 2000*</b>
October 2000	December 22, 2000
November 2000	January 31, 2001
<b>December 2000</b>	<b>February 28, 2001*</b>

\* The quarterly income and expenditure-based GDP at market price will also be released on these dates. Release dates for the upcoming year are published, along with those for other major economic indicators, in December.

The data on CANSIM appear in greater industrial detail than in the *Daily* and are also in both seasonally adjusted and in seasonally unadjusted form. They are available historically from January 1961, and may be retrieved from the following matrices (see Appendix III):

#### Data and Matrix Numbers

Annual	4677
Quarterly, seasonally adjusted	4678
Quarterly, without seasonal adjustment	4679
Monthly, seasonally adjusted	4680
Monthly, without seasonal adjustment	4681

Information can also be obtained by calling any Statistics Canada regional office or Industry Measures and Analysis Division (1-800-877-IMAD).

#### **5.2 Publications**

The monthly, quarterly and annual constant price estimates of Gross Domestic Product by industry are published in *Gross Domestic Product by Industry*, Statistics Canada, Catalogue no. 15-001-XPB, available approximately five working days after the data have been released. This publication contains seasonally adjusted data extending back to 1992, the current base year.

For the period 1961 to 1992, the historical monthly, quarterly and annual values in 1992 prices are published in *Gross Domestic Product by Industry (1992=100)*, 1961-1992, Catalogue no. 15-512-XPB (September 1998).

\* Data not available after 1994.

\*\* For some of the lowest levels of aggregation, it is not possible to have an homogeneous series from 1961 to the present. For that reason, special industry groupings that provide relatively good continuity were created back to 1961.

## Appendix IV - A Note on Data Revisions for the Period 1994 to 1999

### Introduction

With the release of the July 1999 data, the monthly estimates of Gross Domestic Product by industry were revised for the current year and for the preceding five years. The revisions incorporate new annual information compiled by the Input-Output Division. This annual data presented in the Input-Output Tables reflects a careful synthesis and reconciliation of both survey and census data from many different sources. It is often referred to as 'benchmark' data.

A comprehensive review of the annual relationships between benchmarks and projectors was also undertaken. The results of this review were used to project the annual levels of GDP in 1997 and the following years for industries where a significant relationship was found. The monthly estimates of GDP were step-adjusted so they would sum to these projected annual levels between 1997 and 1998 and to the benchmarks for 1994 to 1996. Subject to these annual adding up constraints, the step-adjustment process also minimized revisions to previously published month-to-month movements in GDP.

### Revisions to Gross Domestic Product by Industry

The following tables provide a summary of revisions to a few special aggregates. Since the major reason for the revisions is to incorporate new annual information, we start by describing the revisions to annual levels and to annual growth rates. This provides a background within which revisions to the quarterly estimates can be discussed.

The revisions to total GDP are shown in the left part of Text Table 1. The total GDP level was unchanged in 1994. In 1995 and subsequent years the GDP level was revised upwards. One of the largest contributors to the change in the GDP level was the revision to the goods producing industries.

Revisions to the annual growth rates are also shown in Text Table 1. The table shows that in 1995 and subsequent years the growth rates were revised upwards 0.1%. These revisions were mainly due to the business sector goods and the non-business sector services.

**Text Table 1. Annual Revisions to Levels and Growth Rates, 1994-1998**
