## Ordering and subscription information

This product, Catalogue no. 15-201-XIE, is published quarterly in electronic format on the Statistics Canada Internet site at a price of CDN \$51.00. To obtain single issues, visit our Web site at [www.statcan.ca](http://www.statcan.ca), and select Products and Services.

This product is also available in print through a Print-on-Demand service, at a price of CDN \$61.00. The following additional shipping charges apply for delivery outside Canada:

	<b>Single issue</b>
<b>United States</b>	CDN \$6.00
<b>Other countries</b>	CDN \$10.00

All prices exclude sales taxes.

The printed version can be ordered by

- Phone (Canada and United States) **1 800 267-6677**
- Fax (Canada and United States) **1 877 287-4369**
- E-mail **order@statcan.ca**
- Mail Statistics Canada  
Dissemination Division  
Circulation Management  
120 Parkdale Avenue  
Ottawa, Ontario K1A 0T6
- And, in person at the Statistics Canada Regional Centre nearest you.

When notifying us of a change in your address, please provide both old and new addresses.

## Standards of service to the public

Statistics Canada is committed to serving its clients in a prompt, reliable and courteous manner and in the official language of their choice. To this end, the Agency has developed standards of service which its employees observe in serving its clients. To obtain a copy of these service standards, please contact Statistics Canada toll free at 1 800 263-1136.

## Note of appreciation

*Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.*

## Symbols

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- P preliminary
- r revised
- x suppressed to meet the confidentiality requirements of the *Statistics Act*
- E use with caution
- F too unreliable to be published

## Acknowledgments

This publication was prepared under the direction Michel Girard, Director of the Input-Output Division and Yusuf Siddiqi, Associate Director of the Input-Output Division with the close participation of Marilyn Constantineau, Marie-Josée Hodgert, André Jacques, Ronald Rioux, Merhzad Salem and Sandy Tennant. The following staff members have contributed in one way or another:

David Arbeau; Jim Armstrong; Michel Bédard; Greg Bell; Franco Belle; Arthur Berger; Tom Blais; Sandra Boivin; Jacinthe Bourdeau; Debbie Brown; Edward Bukenya; James Cameron; Jeffrey Cameron; Stéphane Caya; Gordon Chan; Jeady Chen-Hicks; David Connell; Brent Crocker; Gwen Cromwell; Lajos David; Tom Dempsey; Margaretta Do; Christine Dominguez; Kudzyi Dondo; James Doré; Vincent Fecteau; Jihane Feghali; Jean-Marie Ferland; Huifa Gai; Pierre Gatto; Pierre Généreux; Ziad Ghanem; Karnail Gill; Douglas Hartman; George Haydu; Duane Hayes; Roland Hébert; Milan Jayasinghe; Gordon Jelinic; Mamady Kaba; Diane Lacasse; Brent Langen; Pat Latimer; Tai Van Le; Dave Leblanc; André Loranger; J. ## The System of National Accounts

In Canada, the National Accounts have been developed since the close of the Second World War in a series of publications relating to their constituent parts. These have now reached a stage of evolution where they can be termed a "System of National Accounts". For purposes of identification, all publications (containing tables of statistics, descriptions of conceptual frameworks and descriptions of sources and methods) which make up this System carry the term "System of National Accounts" as a general title.

The System of National Accounts in Canada consists of several parts. The annual and quarterly Income and Expenditure Accounts (included with Catalogue Nos. carrying the prefix 13) were, historically speaking, the first set of statistics to be referred to with the title "National Accounts" (National Accounts, Income and Expenditure). The Balance of International Payments data (Catalogue Nos. with prefix 67), are also part of the System of National Accounts and they, in fact, pre-date the Income and Expenditure Accounts.

Greatly expanded structural detail on industries and on goods and services is portrayed in the Input-Output Tables of the System (Catalogue Nos. with prefix 15). The Catalogue Nos. carrying the prefix 15 also provide measures of the contribution of each industry to total Gross Domestic Product at factor cost as well as Productivity Measures.

Both the Input-Output tables and the estimates of Gross Domestic Product by Industry use the establishment as the primary unit of industrial production. Measures of financial transactions are provided by the Financial Flow Accounts (Catalogue Nos. with prefix 13). Types of lenders and financial instruments are the primary detail in these statistics and the legal entity is the main unit of classification of transactors. Balance sheets of outstanding assets and liabilities are published annually.

The System of National Accounts provides an overall conceptually integrated framework in which the various parts can be considered as interrelated sub-systems. At present, direct comparisons amongst those parts which use the establishment as the basic unit and those which use the legal entity can be carried out only at highly aggregated levels of data. However, Statistics Canada is continuing research on enterprise company establishment relationships; it may eventually be feasible to reclassify the data which are on one basis (say the establishment basis) to correspond to the units employed on another (the company or the enterprise basis).

In its broad outline, the Canadian System of National Accounts bears a close relationship to the international standard as described in System of National Accounts, 1993, a joint publication of the Commission of the Euro-pean Communities, International Monetary Fund, Organization for Economic Co-operation and development, United Nations and World Bank.

## Overview

### What's new in this publication

This publication updates *Input-Output Structure of the Canadian Economy*, Cat. 15-201-XIE. Important changes include:

- **Improved data quality**  
Statistics Canada undertook a massive project to improve its provincial economic statistics in 1996. Using sub-national surveys and other improved sources, the reliability of statistics published here is substantially improved and is approximately equal across provinces.
- **Provincial input-output tables**  
Beginning with reference year 1997, input-output tables are compiled and published annually in this catalogue for each province and territory of Canada. Sub-national tables sum to the national tables for Canada. The accounting framework and concepts of these tables are identical to the national tables that date back to the 1961 reference year. We also refer in the text to exports and imports between provinces as well as abroad. To have access to the interprovincial trade data please consult the following table in CANSIM II: Table -386-0002.
- **NAICS**  
In the new input-output tables industries are classified by the North American Industry Classification (NAICS), rather than the 1980 Standard Industrial Classification (SIC), to be consistent with Statistics Canada's adoption of NAICS. This has led to changes in the detail and presentation of goods and services.
- **Valuation of industry GDP**  
The valuation of industry gross domestic product has changed from factor cost to basic price, in accordance with conventions recommended by the 1993 SNA (System of National Accounts). Under the old valuation, industry gross domestic product was calculated to include the returns to labour and capital only, excluding taxes or production subsidies. The new valuation of industry GDP is basic prices which includes Other Taxes on Production and Other Subsidies on Production. Data on gross output is at modified basic price, because production data show prices actually received by producers thus reflecting the effect of subsidies on products.
- **Refinements to the 1993 SNA conventions**  
A number of refinements to the adopted recommendations were implemented affecting the treatment of specific transactions or industries.

### First Publication with Annual Provincial Input-Output Tables

With this publication, Statistics Canada is providing input-output (IO) accounts for all provinces and territories of Canada on an annual basis. Until now, annual publication of input-output accounts were limited to the national economy. These accounts are the most comprehensive and detailed statistics on transactions involving production activity and intermediate as well as final consumption of goods and services in the economy. The accounts are prepared at the Worksheet level of detail, consisting of 299 industries, 725 groups of goods and services (commodities), and 170 categories of final users. There are three more compact versions of the tables that are usually available to the public: the Link, the Medium and the Small aggregation tables. The most compact presentation of IO accounts, the Small IO tables, are provided in this release.

### A Quick Guide to the IO Accounts

#### What are Input, Output and Final Demand Tables

The input-output accounts of Canada and its provinces and territories are presented in three main data tables (matrices) for each jurisdiction. These are the output table, input table, and the final demand table. In addition, provinces' and territories' tables are linked together through an interprovincial flows table that shows each jurisdiction's exports to, and imports from, other provinces and territories as well as abroad. These tables are compiled every year by Statistics Canada using newly instituted surveys and other improved sources that are designed to collect reliable statistics from each jurisdiction. The tables are part of the Canadian System of National Accounts (CSNA). The CSNA is a system of integrated statistical accounts consisting of four components: input-output tables, income and expenditure account (national and provincial), balance of payments and international position, and environment accounts. This system is "integrated" in the sense that all of the data belonging to this system are consistent with one another. IO tables cover all economic activities conducted in the market economies of each province and territory, encompassing persons, businesses, government and non-governmental (non-profit) organizations, and entities outside its jurisdiction that give rise to imports or exports (interprovincially or internationally).

To compile the IO accounts, Input-Output Division obtains source data from all relevant surveys as well as administrative sources such as tax records, professional and industry organizations, and non-government institutions every year for each province and territory. In the process of preparing statistical estimates, data from various sources are confronted,

analysed by subject-matter experts, and used to compile estimates that are consistent with all other estimates in the System and provide a valid and coherent statistical picture of the subject matter. Consistency is a key feature of the statistics produced by the Accounts. It is highly valuable to the user because data taken from the Accounts do not disagree with each other or provide contradictory information. When various data bearing on the same subject do not provide a consistent picture, the user is left in the position of either reconciling inconsistencies without the benefit of necessary information, or discarding the data for lack of realism or credibility. A good example of how consistency is achieved through data integration is a process known as “commodity balancing”. Because, logically, the supply of a good or service from all possible sources must equal its demand or disposition in a given jurisdiction, every good and service in the economy is scrutinized to make sure it obeys this rule before it is used for IO compilation. When supply does not add up to demand or disposition (demand plus inventory), as is often the case<sup>1</sup>, each data source is questioned, errors and omissions are corrected, and sometimes the data is re-estimated in light of more reliable information to achieve complete balance between supply and disposition.

#### What IO tables show

The tables are set up on a year-by-year basis, rather than in time series. Tables for Canada (the national tables) date back to 1961, while regular sub-national tables began with the 1996 reference year. The tables identify transactions in three ways:

1. they show data by *commodity*, a neutral terminology for a group of goods or services or type of transactions (e.g., “wages” or “indirect taxes”); The most detailed tables, the Worksheet tables, groups all transactions into 725 commodities. Tables that are published electronically—known as the “Small” tables—compact this detail into 57 commodities.
2. they show data by *industry*: a group of producing units, such as establishments or enterprises, that are engaged in market transactions in goods or services. The term “industry” does not imply that they are industrial businesses. The terminology covers all entities that conduct activities involving market transactions. The concept includes such groups as Municipal Governments, non-profit institutions such as Sports and Recreation Clubs, and professions such as Offices of Dentists. The Small tables published here show 25 very aggregate industries but, at the most detailed (Worksheet) level, the tables are made up of 299 industries.
3. they show data by categories of *final demand*, a convenient breakdown that identifies transactions that constitute final sales of goods and services.

#### The Final Demand Table

This table shows transactions in goods and services, in a province or territory, that are for *final* use. A transaction is for final use when the good or service is exported, when it is bought for final consumption (i.e., it is not used to produce other goods and services for the market), or as capital investment. While all purchases by households (persons) are considered final consumption in the System, businesses, governments, and other entities make purchases both as intermediate and as final expenditure. Their intermediate expenditures are shown in the Input (or Intermediate Use) table and their final expenditures are shown in the Final Demand table. For instance, when a retail store pays for electricity, it is shown as payment from Retail Trade industry (Input table) and as output for Electric Power industry (Output table). However, when the same store buys payment processing machinery, the payment is shown in the Final Demand table as investment by the Retail Trade industry and also either an output of the relevant Canadian industry, as an import, or as a withdrawal from inventories of the particular machinery. Imports are also shown in the Final Demand table.

In this publication, the Final Demand table is shown with a breakdown of 13 categories, but at the most detailed level, IO tables are compiled with a breakdown of 170 categories. Regardless of the level of detail, Final Demand tables always distinguish the following broad categories:

- 1) Personal Expenditure of households<sup>2</sup>, 2) Capital investment by persons, governments and non-profit entities (separately for Construction investment and Machinery and Equipment investment), 3) Current expenditures of governments, 4) Additions to or withdrawals from inventories (withdrawals are shown as negative values), 5) Exports to other provinces, 6) Imports from other provinces, 7) International exports of a province or territory and, 8) International imports of a province or territory. In the most detailed table these categories are presented with the 725 commodity detail, but are only shown with the more compact 57 commodity detail in this release. Some of these expenditures are presented with a useful breakdown. For instance, Personal Expenditure presented in this release is broken down into durable goods, semi-durable goods, non-durable goods, and services. In the most detailed table, personal expenditure is shown for 52 categories.

<sup>1</sup> Statistics are often prepared according to different concepts. They are also evaluated on a different basis or cover slightly different periods, i.e. fiscal versus calendar year.

<sup>2</sup> This includes personal spending by residents of a province, whether spent in their own or another province or territory or country while visiting. It also includes the full value of capital equipment under finance leases acquired by individuals (e.g., automobiles). Personal expenditure is higher than actual (cash) spending because of a number of national accounting imputations. These are: an imputation for services (rental value) of owner-occupied dwellings, an imputation for interest payments to financial institutions net of interest income from the same source, an imputation for the investment income of insurance carriers and for changes in their actuarial reserves when related to persons net of insurance claims.

### The Input Table

The input table, also known as the Intermediate Use table, is where purchases that relate to production (current expenses) are presented for groups of producing units (industries). It was noted earlier that, in the context of input-output accounts, “industry” also refers to entities such as governments, non-profit organizations, professions, and so on. In these cases, inputs refer to their current (i.e., non-capital) expenditure on goods and services. The input table includes a few other entries that businesses would report on the expense side of their income statement. These are: Indirect Taxes on Production (e.g., property taxes), Indirect Taxes on Products (e.g., sales taxes), Subsidies on Products, Subsidies on Production (e.g., manpower training subsidies), Wages and Salaries, Supplementary Labour Income (e.g., employers’ contribution to employment insurance), Mixed Income (e.g., income of unincorporated businesses), and Other Operating Surplus. The latter item is the income or loss that is left over after accounting for the cost of all intermediate inputs and the items just discussed. This ensures that the sub total of inputs for a given industry is equal to its “outputs” (discussed below) and an accounting identity is maintained between inputs and outputs of industries. The most detailed input table for a province shows up to 725 goods and services used for each of 299 industries. The current release shows a more compact table with 25 industries and 57 goods and services.

### Gross Domestic Product

The eight cost entries found in the input table (see previous paragraph) contain all the data one needs to calculate the Gross Domestic Product (GDP) of each industry in a province. GDP at basic prices—the statistic officially published by Statistics Canada—is obtained by adding the last six components. GDP at market prices is the sum of all eight cost components. Using this data, we one can calculate the GDP of a province or territory, GDP of the whole Canadian economy, showing either the provincial or the industrial composition of GDP across Canada.

### The Output Table

The Output table, also known as the Make table, is where the values of production of good and services are recorded for each producing industry in a given jurisdiction (e.g., a province). Once again, the term “industry” is comprehensive, covering all entities except households (persons).

In most cases, production or output of an industry is simply their sales or shipments<sup>3</sup>. Production, of course, excludes used goods, because they were already counted as production in an earlier period. For retailers and wholesalers, production is considered to be the value they add to (or the margin they earn from) the products they sell, rather than the total receipt from their sales. For owners of real property, production is gross rent receipts, except for residential properties occupied by their owners where an imputation is made for the equivalent rental value of living in the property.

For banking and similar services, the net interest income of the institutions is considered production. Where they charge fees for their services, they are also considered output. The production of insurance carriers consists of premiums net of claims and adjustment expenses, plus incomes earned on invested reserves as well as rental income, plus changes in actuarial reserves. For construction, the value of work that has been put in place in a particular jurisdiction is considered output, whether this is done by hired contractors or by the industry (e.g. electric power) on its own account<sup>4</sup>. For holding companies, non-profit institutions (e.g., churches, clubs), the central bank and general government, the value of their output is computed as the sum of operating expenses, labour compensation and depreciation of fixed capital. Hospitals, schools, universities and other institutions that are funded by governments but also earn operating revenues have an additional output equal to their revenues from sales of goods

<sup>3</sup> Production also includes what is produced in a year but not sold (added to inventories), excludes sales out of inventories (and gains or losses from changes in inventory values), and includes own-use (e.g., feed corn grown by farmers for their own livestock).

<sup>4</sup> This means that construction “industry” covers the entire activity, rather than only the work of entities working in the construction industry.

## Availability of data

### 1. CANSIM II

#### a) *Input-Output Tables*

The Input-Output Tables of this publication are stored in CANSIM II at the Small (S) level, Medium (M) level and Link (L) level of aggregation.

<b>L Level C \$</b> Time series 1961-1998	<b>M level C \$</b> Time series 1961-1998	<b>S level C \$</b> Time series 1961-1998

Final Demand CANSIM II Table 381-0010	Final Demand CANSIM II Table 381-0011	Final Demand CANSIM II Table 381-0012

#### b) *Gross Domestic Product at basic price*

The time series of Gross Domestic Product (GDP) at basic price from 1961 to 1998 are also available on CANSIM II at S, M, and L levels of aggregation.

Time series: 1961-1998

Type: hierarchical (S,M,L), current dollars (C\$)

The GDP data are presented in CANSIM II hierarchical format in the order of S, M and L aggregations. The two digits NAICS code represents the S level, the three digits NAICS code denotes the M level and the four digits NAICS code indicates the L level of aggregation.

Business Sector Industries C \$	Non-business Sector Industries C \$	Total C \$	Special Aggregations C \$

### 2. Input-output division

For the period 1961-1998, the following data in current dollars are available from the Input-Output Division on request:

- a) The Input-Output Tables;
- b) The Gross Domestic Product (basic price or market price);
- c) Gross Outputs;
- d) Trade, Transport and Tax Margins by Commodity and services

#### Note to Users

In this publication we publish the final tables of 1997 and 1998 and we keep the detailed classifications of 1997. The classifications having changed in 1998, the new classifications of 1998 final and 1999 preliminary will be published in the next issue of this publication. These new classifications are available on demand.

335100 Electric lighting equipment manufacturing	3351
335311 Power, distribution and speciality transformers manufacturing	335311
335312 Motor and generator manufacturing	335312
335315 Switchgear and switchboard, and relay and industrial control apparatus manufacturing	335315
335910 Battery manufacturing	33591
335920 Communication and energy wire and cable manufacturing	33592
3359A0 Wiring devices and all other electrical equipment and component manufacturing	33593, 33599
336 Transportation equipment manufacturing	336
3361 Motor vehicle manufacturing	3361
336110 Automobile and light-duty motor vehicle manufacturing	33611
336120 Heavy-duty truck manufacturing	33612
3362 Motor vehicle body and trailer manufacturing	3362
336200 Motor vehicle body and trailer manufacturing	3362
3363 Motor vehicle parts manufacturing	3363
336310 Motor vehicle gasoline engine and engine parts manufacturing	33631
336320 Motor vehicle electrical and electronic equipment manufacturing	33632
336330 Motor vehicle steering and suspension components (except spring) manufacturing	33633
336340 Motor vehicle brake system manufacturing	33634
336350 Motor vehicle transmission and power train parts manufacturing	33635
336360 Motor vehicle seating and interior trim manufacturing	33636
336370 Motor vehicle metal stamping	33637
336390 Other motor vehicle parts manufacturing	33639
3364 Aerospace product and parts manufacturing	3364
336400 Aerospace product and parts manufacturing	3364
3365 Railroad rolling stock manufacturing	3365
336500 Railroad rolling stock manufacturing	3365
3366 Ship and boat building	3366
336611 Ship building and repairing	336611
336612 Boat building	336612
3369 Other transportation equipment manufacturing	3369
336900 Other transportation equipment manufacturing	3369
337 Furniture and related product manufacturing	337
3370 Furniture and related product manufacturing	337
337110 Wood kitchen cabinet and counter top manufacturing	33711
337127 Institutional furniture manufacturing	337127
33712A Household furniture manufacturing	337121, 337123, 337126

\* Notes:

The small (S) level industrial categories are expressed by a 2 character identification code

The medium (M) level industrial categories are expressed by a 3 character identification code

The historical link (L) level industrial categories are expressed by a 4 character identification code

The worksheet (W) level industrial categories are expressed by a 6 character identification code

\*\* This classification is used for calculation of GDP by industry.

## Data quality, concepts and methodology

### Presentation of data

#### A. Contents of the input-output tables

In the Canadian System of National Accounts, the Input-Output Accounts have two sets of interrelated accounts: (a) the Industry Accounts; and (b) the Commodity Accounts. The Industry Accounts contain the commodity composition of industry output and its complete costs of production including profits (surplus). The Commodity Accounts, on the other hand, show the supply and disposition of goods and services. The framework of the Canadian Input-Output Tables is closely related to the one described in the United Nations report, System of National Accounts, 1993. The inputs and outputs of industries, classified by commodity, are presented in separate tables. The Canadian Input-Output Tables are rectangular rather than square since the number of goods and services exceeds the number of industries. Square tables have been an international standard for most countries from the beginning of Input-Output concepts. Square means having the same dimensions, either product-by-product tables or industry by industry. The product by product table shows which products are used in the production of which other products; the industry by industry table which is by far the most widely used shows which industry uses the output of which other industry. From our own rectangular framework we can build square tables: industry by industry and industry by categories of final demand.

For each year, three basic tables are prepared: (1) Make (Output) Matrix; (2) Use (Input) Matrix; and (3) Final Demand Matrix. The Input-Output Accounts are prepared and balanced at the most detailed level known as the "Worksheet" (W) level, with 299 industries for the year 1997 and 300 industries for the year 1998. The number of goods and services and primary inputs add to 725 in 1997 and 727 in 1998. In the final demand, there are 170 categories for the years 1997 & 1998. The Worksheet (W) level data are then aggregated into Link (L), Medium (M), and Small (S) levels for consistency during the entire period as shown in the following table.

At the W, L and M levels of detail, some of the entries in various national matrices are confidential under the provisions of the Statistics Act. Consequently, data are provided to users after suppressing the confidential cells where applicable. The provincial tables are available at the "S" level of aggregation only and cell suppression is performed at that level.

The tables in the present publication are at the S level of aggregation, covering 51 goods and services and 6 primary inputs, (a total of 57), 25 industries and 13 final demand categories<sup>1</sup>. The concordances among the various levels of aggregation for industries, goods and services and primary inputs are provided in the Appendix A.

<sup>1</sup> The final demand categories reflect mainly spending by consumers, fixed capital formation, inventories and imports and exports.

Designation of Aggregation	Number of Industries	Number of Final Demand Categories	Number of Goods & Services and Primary Inputs
S (Small)	25	13	57
M (Medium)	64	37	109
L (Link)	113	120	476
W (Worksheet)	299	170	725

## B. Understanding the content of the national input-output tables

This section presented here highlights the descriptive as well as the analytical usefulness of input-output data, using a series of examples. Observed relationships between industries producing several goods and services and various users of these goods and services allow establishing meaningful economic relationships. A number of possible applications of the data are also offered. The examples are meant to familiarize the reader with the richness of the basic data as well as their potential for various analytical uses. For simplicity we present the data content using the National Input-Output Tables. The same demonstration applies to the provincial tables as well.

The illustration uses one manufacturing industry, and one commodity, petroleum & coal products, at the S level of aggregation. Utilizing data for 1998 (tables 7, 8 and 9), the industry can be identified as column 8 of the Make and Use Matrices and the commodity as row 26 in the Make, Use and Final Demand Matrices.

- i. Producers
- ii. Users
- iii. Composition of outputs and inputs
- iv. Gross domestic product (GDP) by industry
- v. Gross domestic product (GDP) for the total economy
- vi. Domestic availability of goods and services
- vii. Import share
- viii. Export share
- ix. Indirect taxes and subsidies

### *(i) Producers*

The simple question, “who produces what?” is easily answered by referring to the Make Matrix where each row shows the distribution of output of each commodity by industry and where each column lists the distribution of output of each industry by commodity. For example, one may find that in 1998 the manufacturing industry (column 8 of the Make Matrix) produced \$16,773 million of petroleum and coal products (row 26) whereas all domestic industries combined (row 26 in the last column of the Make Matrix) produced \$19,008 million of that commodity. Thus, the manufacturing industry accounted for 88.2 percent of the total domestic production of this commodity in 1998 ( $16,773 / 19,008 \times 100 = 88.2$  percent).

### *(ii) Users*

The Input-Output Tables display the demand for various goods and services which may be used as intermediate inputs (goods and services that are purchased by an industry from

other industries to produce its outputs) or for final consumption by persons, governments, etc. So, the question, “who buys what?” is answered by referring to the Use (Input) and Final Demand Matrices. Elements in the row of the Use Matrix show the use of a particular commodity by various industries whereas elements of the same row appearing in the Final Demand Matrix indicate its use by various categories of final demand. For example, in 1998, altogether, industries used petroleum and coal products worth \$13,509 million – the sum of row 26 across the columns of the Use Matrix. Individual entries across row 26 represent individual uses by the industry shown as a column.

### *(iii) Composition of outputs and inputs*

The detailed presentation of data on outputs and inputs presented in this publication permits analysis of the composition of outputs and inputs of each industry over time. Once again, using the Make Matrix, one is able to observe, say for 1998, that the total output of the manufacturing industry (column 8) amounted to \$462,967 million. Of this, petroleum and coal products accounted for \$16,773 million which represents 3.6 percent of the total output of that industry.

In a similar manner, inputs that are needed to produce outputs of industries can be identified in the Use Matrix. For example, column 8 of the Use Matrix lists various inputs needed to produce the output of the manufacturing industry. The magnitude of changes in the value of inputs over time can be identified and analyzed.

### *(iv) Gross domestic product (GDP) by industry*

Generally speaking, the gross output of an industry consists of the value of the goods and services produced by that industry: the value of steel produced by the steel industry; the value of cars and trucks produced by the motor vehicles manufacturing industry; etc. A brief reflection tells us that, for example, the production of steel requires coal and iron ore and other inputs. These goods and services are not the products of steel mills. Rather, they are produced by other industries and used by the steel mills as their inputs. Thus, a measure of the unduplicated production of an industry should exclude all intermediate inputs purchased from other industries. This measure is called value added or Gross Domestic Product.

The Use Matrix displays all the costs incurred in production by an industry: the goods and services used as intermediate inputs; indirect taxes and subsidies; and returns to the factors of production (rows 54 to 57 of the Use Matrix), namely: wages and salaries, supplementary labour income, mixed income and other operating surplus.

*(v) Gross domestic product (GDP) for the total economy*

There are two measures of the Gross Domestic Product which provide valuation of the production of goods and services at different levels. They are: (a) Gross Domestic Product at Basic Price<sup>2</sup>; and (b) Gross Domestic Product at Market Prices.

Basic Price valuation represents the earnings of the factors of production as measured by the costs of labour (wages and salaries, supplementary labour income); capital inputs (mixed income and other operating surplus); plus indirect taxes on factors of production less subsidies on production.

Indirect taxes (row 52) are a cost to the industry and are reflected in the market price of goods and services produced by the industry. Subsidies (row 53), where applicable, have the effect of lowering cost to the firms receiving them, and thus reduce the market prices of goods and services produced by the industry. They are shown as negative (-) entries in the Use (Input) Matrix. Both indirect taxes and subsidies on products and on production affect the market price valuation of goods and services.

It should be noted that indirect taxes are paid not only by the business sector but also by other sectors of the economy which are covered in the Final Demand Matrix of this publication. Subsidies, by definition, apply only to the business sector of the economy.

The GDP at Market Prices as calculated from a revenue approach is called income-based GDP and from an expenditure approach is called expenditure based GDP. The Input-Output Accounts also incorporate components of expenditure-based GDP and is obtained by summing up personal expenditure, capital formation, government current expenditure, change in the value of inventories and net exports (exports less imports) appearing in the Final Demand Matrix. In the Final Demand Matrix, these categories are shown at a finer level of detail.

*(vi) Domestic availability of goods and services*

It may be of interest to know the domestic availability of a particular commodity (or all goods and services) for one or many years. The domestic availability of a commodity is defined as total production less exports plus imports (assuming no inventory change). These values can be read directly from the Input-Output Tables. In 1998, the domestic production of petroleum and coal products was \$19,008 million (last column of the Make (Output) Matrix) while total exports were \$4,428 million (column 12 of the Final Demand Matrix) and imports were \$3,497 million (column 13 of the Final Demand Matrix). Thus, the domestic availability of this product can be derived as: \$19,008 million domestic production - \$4,428 million exports + \$3,497 million imports = \$18,077 million.

*(vii) Import share*

The data used in the preceding section also allow the calculation of the import share of a commodity, that is, what portion of the domestic availability of a commodity comes from foreign countries. From these data, the import share for the same commodity can be calculated as follows:

$(\text{Total imports} / \text{Total domestic availability}) \times 100$

that is for 1998:

$(3,497 / 18,077) \times 100 = 19.3 \text{ percent.}$

*(viii) Export share*

For countries with considerable foreign trade like Canada, there is a keen interest in measures of export intensity. A simple indicator of such an intensity is the proportion of total domestic production that is exported. Using the same commodity as in the previous illustrations, 23.3 percent of the domestic production of petroleum and coal products was exported in 1998 as follows:

$(4,428 / 19,008) \times 100 = 23.3 \text{ percent.}$

*(ix) Indirect taxes and subsidies*

In compiling Input Output Accounts at producers' prices and purchasers' prices, the costs or margins that arise between the value received by the producer (i.e. the value that covers all costs of production) and the value paid by the purchaser must be identified. One of these margins is the value of commodity taxes paid by the purchaser, be it an industry or a category of final demand. All commodity indirect taxes and all other indirect taxes are classified to the industry or final demand category paying them. The total of such taxes agrees with values published in the National Economic and Financial Accounts (Catalogue 13-001-XPB) but the Input Output Accounts provide additional information such as the industries and final demand categories which pay these taxes. Similarly,

<sup>2</sup> *The valuation at basic price is the internationally preferred method to value the cost of factors of production used in the production process. Market price valuation reflects actual costs to the users. It is a concept that is used to measure consumption. The difference between the two concepts is the value of taxes on products, net of subsidies. GDP at basic price can be calculated from the I/O Tables. In the detailed tables we distinguish eight elements in the primary inputs which can be used to calculate both the GDP at market price and the GDP basic price. The detailed list of these primary inputs is as follows:*

*Indirect taxes on products  
Subsidies on products  
Subsidies on production  
Indirect taxes on production  
Wages and salaries  
Supplementary labour income  
Mixed income  
Other operating surplus*

*To calculate GDP at market price all the components above must be added while the GDP basic price is obtained by summing the last six components of the same list. In this publication, the small "S" tables aggregates the indirect taxes together and the subsidies together.*

in the Input-Output Tables, subsidies are allocated to the industries receiving them. Also, from 1986 onwards, subsidies are broken down into two categories: commodity subsidies and non-commodity subsidies. These details and their routing in the Input-Output Accounts make additional analyses possible, e.g., to determine the effects of taxes and subsidies, to build certain policy simulation models, etc.<sup>3</sup>

<sup>3</sup> See for example Durand, René and Rioux, Ronald: "Estimating Final Demand Expenditure at Factor Cost and Net Price Indices", *Economic Systems Research*; Vol. 6, No. 3, 1994, pages 265-275.

<sup>1</sup> Ratings

A - most reliable

B - reliable

C - acceptable

<sup>2</sup> Intermediate inputs only

\* The quality ratings are determined with reference to the latest benchmark year.

### **Current price estimates**

The ranking for the current price estimates have, in general, been determined as follows: A rank of A is assigned to estimates (aggregates or commodity detail), that are based completely on censuses, surveys or administrative records with minimum adjustments for coverage, valuation and classification.

The majority of manufacturing industries, for example, have a rank of A for current price outputs, inputs and Gross Domestic Product. Undercoverage is minimal and very good commodity output detail exists. In general, intermediate inputs are well specified. Those for the use of fuel and electricity, containers, and raw materials are also well detailed, and purchased services are estimated from diverse sources. Wages and salaries are derived from the Census of Manufactures. The surplus for the manufacturing industry is calculated as the difference between outputs and operating inputs; therefore, its quality is related to these items. Aggregate outputs for non-residential construction and its commodity flows to final demand as well as the aggregate value for machinery and equipment have a rank of A, since this information comes directly from the Capital Expenditure survey. Imports, exports and re-exports are well defined by commodity and given a rank of A. Most government industry control totals and commodity detail for inputs and Gross Domestic Product are ranked as A since detail is readily available from administrative records.

A rank of B refers to estimates that are developed using the same sources as listed in (a). The difference is that only the aggregate value of some important inputs and outputs is available and the commodity detail required for the Input-Output framework needs to be estimated.

This implies that estimation must be done for commodity detail of transactions reported under broad categories such as "all other". The sources occasionally have very general commodity or functional descriptions which must be coded to Input-Output commodity detail. For example, utilities have to be specified in terms of electricity and type of fuels, etc.

A rank of C refers to estimates for which no direct information is available even for control totals or to estimates which are based on occasional surveys extrapolated to the current period or interpolated between two data points.

For example, no survey exists for the industry Services Related To Mineral Extract. In addition, the inputs and outputs of some industries in transportation and services must also be estimated.

In general, weaknesses in source data arise mainly from the following: a) incomplete details on particular commodities; b) undercoverage; c) inappropriate concepts and definitions. These are briefly discussed below.

#### *a) Incomplete details*

The most obvious weakness arises from the use of source data where adequate commodity details are not available. These are, therefore, estimated. In the commodity balancing process the estimates are reviewed and adjustment made when necessary.

#### *b) Undercoverage*

This weakness is normally corrected by inflating reported data by a factor that allows the data to represent the universe concerned. For example, in the case of hospitals, the number of beds in all hospitals is used to inflate reported annual data which relate to the reported number of beds in hospitals included in the survey.

#### *c) Concepts and Definitions not Suitable for the SNA*

For administrative records, the data are quite varied in coverage, details, definitions and concepts and often these factors do not coincide with those required for the Input-Output Accounts. They must be thoroughly examined and adjusted for consistency and coverage using carefully designed estimating procedures.
