Note of appreciation

Canada owes the success of its statistical system to a long standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

Symbols

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0^s value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- p preliminary
- r revised
- x confidential to meet secrecy requirements of the *Statistics Act*
- E use with caution
- F too unreliable to be published

Note

Components may not add to totals due to rounding.

Highlights

June 2004

- Weak demand for new passenger cars in June caused new motor vehicle sales to fall 1.9%. However, according to preliminary auto industry figures, this drop, the second in a row, was entirely offset by a gain of approximately 2.0% in July. In all, 130,245 new vehicles were purchased in June, down 2,493 units from May.

Analysis – June 2004

Weak demand for new passenger cars in June caused new motor vehicle sales to fall 1.9%. However, according to preliminary auto industry figures, this drop, the second in a row, was entirely offset by a gain of approximately 2.0% in July. In all, 130,245 new vehicles were purchased in June, down 2,493 units from May.

Chart 1

New motor vehicle sales, seasonally adjusted, in units, 2001-2004

June's drop in sales occurred despite the purchasing incentives already in place and others newly introduced by automakers. These incentives were intended, in part, to maintain market share and boost sales following a poor showing in May.

The declines registered in June and May followed a series of increases that began in January 2004 and peaked in April, stimulated by fleet sales. This ascending sequence had followed a sustained downward period in the second part of 2003. During the first part of that year, sales had fluctuated greatly with the trend falling off from 2002's record levels.

Note to readers

All data in this release are seasonally adjusted unless otherwise indicated. Seasonally adjusted provincial data back to January 1991 are available on CANSIM.

Passenger cars include those used for personal and commercial purposes, such as taxis or rental cars. **Trucks** include minivans, sport-utility vehicles, light and heavy trucks, vans and buses.

North American-built new motor vehicles include vehicles manufactured or assembled in Canada, the United States or Mexico. All other new motor vehicles are considered to have been manufactured overseas.

For reasons of confidentiality, data for Yukon, the Northwest Territories and Nunavut are included with those for British Columbia.

The New Motor Vehicle Sales Survey is compiled using figures obtained from motor vehicle manufacturers and importers. These results may vary from those obtained directly from auto dealers as a result of possible differences in record keeping.

Car sales decline

Despite the introduction of new purchasing incentives by some automakers in June, passenger car sales did not rise; in fact, they fell, while truck sales remained unchanged.

The number of new passenger cars sold stood at 67,468, down 3.6% from May, for a second consecutive monthly decline. The decrease is mainly attributable to North American-built cars, which accounted for more than two-thirds of the drop.

In June, 62,778 new trucks were sold. This was almost the same level as in May, a month when sales were down. Trucks include minivans, sport-utility vehicles, light and heavy trucks, vans and buses.

Sales of both passenger cars and trucks have generally been moving upward since the start of 2004, following a period of steep declines in the second half of 2003. This downward movement was first observed in passenger car sales, which began to decline in the fall of 2002. Only later did truck sales weaken. Despite great volatility, truck sales remained generally stable until the fall of 2003.

Quarterly sales post major gains

Despite the declines observed in June and May, second quarter sales were higher than in the first quarter.

The number of new motor vehicles sold in the second quarter of 2004 jumped 4.6% compared with the previous quarter, when a modest gain (+0.3%) was recorded. However, year-over-year, second quarter sales were down 1.8% compared with the same period in 2003.

Chart 2

Passenger car sales, seasonally adjusted, in units, 2001-2004

Truck sales rose 5.1% in the second quarter compared with the first, when they also advanced (+2.2%). Sales of passenger cars were up 4.1% compared with the previous quarter (-1.4%).

The gain registered by new passenger cars in the second quarter is entirely attributable to robust sales of North American-built cars, which advanced 6.1% while sales of overseas-built cars edged down 0.3% compared with the first quarter.

Three provinces stand out

In June, new motor vehicle sales were down in most provinces compared with May. In the Atlantic provinces, sales rose in Nova Scotia (+4.4%) and New Brunswick (+1.7%), while in the Western provinces, only Manitoba reported an increase (+1.5%) in sales compared with May.

The drop observed in Ontario (-3.8%), the second in a row, accounted for more than three-quarters of the national decline in the number of new motor vehicles sold compared with May. In Ontario, the back-to-back declines observed in June and May followed a series of increases that began in January 2004 and reached a peak in April. Previously, sales had generally been following a downward movement since the start of 2003, after remaining strong throughout 2002.

Newfoundland and Labrador reported the largest drop (-8.3%) from May. For the province, the decline followed four consecutive months of rising sales. Despite that string of advances, new motor vehicle sales in the province have

maintained a downward movement that began in the fall of 2003. That movement was reinforced by the large drop (-20.0%) recorded in January 2004.

1. For reasons of confidentiality, data for the Yukon, the Northwest Territories and Nunavut have been included with the data for British Columbia.

Definitions

Trucks

Trucks include light and heavy trucks, minivans, sport utility vehicles, vans, coaches and buses, regardless of their intended use.

Passenger car

The term passenger car refers to all vehicles whose primary function is to carry passengers, excluding those vehicles classified as a commercial vehicle (see definition above). Passenger cars also include cars used for commercial purposes, i.e. taxis, auto rentals and other car fleets.

Country of origin

New motor vehicles fall into two categories defined on the basis of origin: those manufactured in North America and those manufactured overseas. The latter are imported in a fully assembled state from countries other than the United States or Mexico. All passenger cars and commercial vehicles assembled in Canada, Mexico and the United States and sold in Canada classified are as North American manufactured vehicles.

Motor vehicle sales - units

The number of new motor vehicles sold in Canada.

Motor vehicle sales - dollars

Net sales refers to the selling price to the consumer, i.e., manufacturer's invoice price plus estimated dealer's markup, including charges for standard and optional accessories. Sales taxes are excluded.

Average price of passenger cars

The average price is obtained by dividing the total dollar sales by the number of units sold. Therefore, changes in the average price reflect variations in the models sold as well as price changes. For example, an increase in the average price for passenger cars may reflect both a shift to more expensive models as well as price increases.

Appendix I

Scope of the survey

The interest in and need for detailed statistics on the automobile industry arose years ago, when the industry began playing a prominent role in the Canadian economy. For over 50 years, Statistics Canada has been collecting and disseminating statistical information on the retail sales¹ of new motor vehicles. Not only are these statistics required to produce estimates of Canadian consumer spending for the national accounts and the gross domestic product, but they have also served and continue to serve as one of the most important, most often requested indicators of the health of Canada's economy.²

However, estimates of the total retail sales volume of new motor vehicles were not sufficient to meet the incessant demand for more information. There came an increasing need for data on the characteristics of the fleet of new vehicles sold at retail, either to learn more about the preferences of Canadian consumers or to assess the penetration of the Canadian market by major foreign manufacturers. Statistics on new motor vehicle sales were expanded in the early 1970s to provide separate figures for Japanese vehicle sales.

The statistics in this report cover exclusively retail sales of new motor vehicles within Canada's borders. Data are derived from a postal survey (a census - see the methodology section at the end of the report for more details).

Other statistics connected with the automobile industry (sales of new and used car dealers, auto parts and accessories stores and so on) are available on the monthly Retail Trade survey (Catalogue No. 63-005). For further information, please contact the Retail Commodity Section, Distributive Trades Division, Statistics Canada, Ottawa, K1A 0T6, (Telephone: 613-951-3549 or toll free at 1-877-421-3067).

Data quality and methodology

This survey is a census of all motor vehicle manufacturers and importers known to be active in Canada.

The value of sales is reported at selling price to consumer (i.e. the manufacturer's invoice price plus estimated dealer's markup, charges for standard equipment and options, less provincial sales tax and federal goods and services tax (G.S.T.) and harmonized sales tax (H.S.T.)).

The response rate for this survey is generally 100%. Minimal estimation is required so there is little bias resulting from non-response introduced in these data.

All attempts have been made to minimize the non-sampling errors: the questionnaires used in the survey have been carefully designed to minimize different interpretations; detailed acceptance testing has been carried out for the different stages of editing and processing.

Data confidentiality

Statistics Canada is prohibited by law from publishing any statistics which would divulge information relating to any identifiable business without the previous consent in writing of that business.³ The disclosure of data likely to reveal specific information on the activity of a particular company is systematically and rigorously controlled and regulated

1. According to the 1980 Standard Industrial Classification Manual, "establishments included in retail trade are those primarily engaged in retail dealing, i.e., buying commodities for resale to the general public for personal or household consumption..."

2. The new motor vehicle sales series is one of ten statistical series making up the leading indicator developed by Statistics Canada for current economic analysis purposes.

3. See Section 17 of the Statistics Act (Chapter 5-19), entitled «Secrecy».

to prevent the publication or disclosure of any information deemed confidential. The rules regarding confidentiality are therefore applied in such a way that no data are shown for cells (or statistical units). If information is withheld for reasons of confidentiality an "X" will appear in the appropriate cell of this publication.

Another way of preserving data confidentiality without having to enter an "X" is to combine (consolidate) the information **from selected regions** (or selected cells) for the same item. The data in question can be aggregated and published in a less detailed, but still confidential, form. For example, the data for the Northwest Territories, the Yukon and Nunavut are included with the British Columbia data.

Seasonal adjustment

Time series contain the elements essential to the description, explanation and forecasting of the behaviour of an economic phenomenon: "They are statistical records of the evolution of economic processes through time."⁴In using time series to observe economic activity, economists and statisticians have identified four characteristic behavioural components: the long-term movement or trend, the cycle, the seasonal (variations) and the irregular (fluctuations). These movements are caused by various economic, natural or institutional factors. The **seasonal variations** occur periodically on a more or less regular basis over the course of the year as a result of seasonal changes in weather, statutory holidays and other events which occur at fairly regular intervals and thus have a major impact on the rate of economic activity.

In the interest of accurately interpreting the fundamental evolution of an economic phenomenon and producing forecasts of superior quality, Statistics Canada uses the X-11-ARIMA seasonal adjustment method ⁵ to seasonally adjust its time series. The ARIMA part of this method minimizes the impact of seasonal variations on the series and essentially consists of adding one year of estimated data onto each end of the original series before it is seasonally adjusted per se. The estimated data are derived from forecasts and back casts using ARIMA (Autoregressive Integrated Moving Average) models of the Box-Jenkins type.

The X-11 part of the X-11-ARIMA program uses primarily the ratio-to-moving average method to smooth the modified series and obtain a preliminary estimate of the trend-cycle, to calculate the ratios of the original series (fitted) to the estimates of the trend-cycle and to estimate the seasonal factors from these ratios. The final seasonal factors are produced only after these operations have been repeated several times. These procedures, used to determine the seasonal factors necessary to calculate the final seasonally adjusted data, are, since February 1983, executed every month instead of once a year. This permits us to update each month, the reference series from which we derive the final estimations of the seasonal factors employing the most current data available.

While seasonal adjustment permits a better understanding of the underlying trend-cycle of a series, the seasonally-adjusted series still contains an irregular component. Slight month-to-month variations in the seasonally adjusted series may be simple irregular movements; to get a better idea of the underlying trend, users must examine several months of seasonally adjusted series.

To assist the user, the Months of Cyclical Dominance number, MCD, is provided.⁶The MCD is the shortest monthly span for which a certain ratio becomes and remains less than one, that is, the ratio for which the absolute average percentage change of the trend-cycle of the seasonally adjusted series becomes greater than the absolute average per cent change of the irregular component. The MCD can be interpreted as the number of months over which a change in the seasonally adjusted series must move in a given direction before one can be reasonably certain that the trend-cycle of that series also has moved in the given direction. Clearly small MCD's are desirable and indicative of a smooth series. Applying a moving average to the seasonally adjusted data of MCD length tends to smooth irregular movements which may obscure the underlying trend-cycle. The MCD moving average provides a method of reducing all types of series to approximately the same degree of smoothness, whatever the size of the irregular component in the original series.

4. «A Note on the Seasonal adjustment of Economic Time Series,» *Canadian Statistical Review*, August 1974.

5. For further information see the X-11-ARIMA/88 Seasonal Adjustment Method, by Estelle Bee Dagum, Statistics Canada.

6. MCD = 7 for North American passenger cars. MCD = 3 or Overseas passenger cars. MCD = 7 for Commercial vehicles.

Revision procedures

The seasonally adjusted estimates are revised for the three months preceding the reference period. Monthly unadjusted data are revised for the previous month, when new information is made available to Statistics Canada. In addition, unadjusted new motor vehicle sales are revised each year, for the latest year, in the February issue of this publication. At that time, monthly seasonally adjusted estimates for the latest four years of data are revised.
