## Ordering and subscription information

This product, Catalogue no. 21-020-XIE, is available on Internet free. Users can obtain single issues at <http://www.statcan.ca/cgi-bin/downpub/freepub.cgi>.

## Standards of service to the public

Statistics Canada is committed to serving its clients in a prompt, reliable and courteous manner and in the official language of their choice. To this end, the Agency has developed standards of service which its employees observe in serving its clients. To obtain a copy of these service standards, please contact Statistics Canada toll free at 1 800 263-1136.

## Note of appreciation

*Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.*

## **SYMBOLS**

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- P preliminary figures
- r revised figures
- x confidential to meet secrecy requirements of the Statistics Act
- E use with caution
- F too unreliable to be published

**NOTE:** Due to rounding, totals may not add.

This publication was prepared under the direction of the Dairy/Food Unit:

Conrad Ogradnik, Unit Head

Patti Wunsch, Statistical Officer

Anna Michalowska, Statistical Officer

### **Acknowledgement**

Agriculture Division would like to acknowledge the contribution of the Food Bureau (Agriculture and Agri-Food Canada) and the Nutrition and Healthy Eating Unit (Health Canada) to this program.

**NOTE:** This publication represents a small portion of information available from [Canada Food Stats](#) (23F0001XCB), a CD-ROM product. The powerful and friendly system gathers data from across Statistics Canada and even includes data from other organizations. It contains information on food consumption and prices, nutrition, supply and demand, as well as data on the food industry, processing, employment, productivity, imports and much more. In addition, *Canada Food Stats* provides a reservoir of written articles and analysis relevant to food from production to processing to consumption.

## **Food Consumption in Canada - 2002**

Canadians are including more fruits and fish in their diets, according to new data on the amount of food consumed. The levels of calories, protein, fat, and most vitamins and minerals have remained stable over the last few years.

New experimental data designed to estimate the quantity of food and nutrients consumed by Canadians are based on estimates of food available for consumption and have been adjusted to account for retail, household, cooking and plate loss.

### **Fruits and vegetables are a popular choice**

Fruits and vegetables remain an important part of the Canadian diet. Major factors contributing to the on-going popularity are promotional campaigns extolling their nutritional benefits together with the growing array of fresh-cut products, prepackaged salads, processed products and imported produce available in the market place.

In 2002, each Canadian ate 93 kilograms of fruit, up 15% from a decade ago. Consumers clearly preferred fresh fruit with bananas, apples and oranges topping the list.

The popularity of blended traditional/tropical juice products has pushed the consumption of traditional fruit juices such as apple, orange and grape juices to 25 litres in 2002 an increase of more than 24% from 1992.

Vegetables remain a popular choice for consumers despite a drop in consumption from a year ago. In 2002, each individual ate an average of 110 kilograms of vegetables (including potatoes) up from 106 kg a decade earlier.

Potatoes represented 35% of all vegetables consumed. Last year, each person ate on average 38 kilograms of potatoes, in fresh form or as processed products such as french fries, potato chips, stuffed baked potatoes or frozen mashed potatoes. That compares with an average intake of 33 kilograms a decade ago.

### **Use of oils and fats remain stable**

Consumption of oils and fats has remained relatively stable over the last 4 years, exceeding 23 kilograms per person. The popularity of oils and fats was fuelled by the growing use of salad and shortening oils by households and/or food service outlets in salad dressings, deep-fried products and commercially prepared cookies, pastries, specialty breads and croissants.

### **Fish consumption increasing**

Fish consumption increased slightly in 2002 to stand at just over 7 kilograms per person. The demand for other sources of protein, marketing and promotional campaigns, and the availability of convenient and easy to prepare products have been factors contributing to this increase.

**Increase in the level of calories and fat consumed from the food supply**

The level of food energy consumed per person, which remained relatively stable throughout the 1970's and 80's, rose 18% from 1992 to 2002. The proportion of calories available from carbohydrates has remained constant at about 52%. The share of calories from fat, up from 34% a decade ago, has leveled off at 36% during recent years. Protein has consistently accounted for about 12% of calories.

The level of fat consumed per person from the food supply on average has remained fairly stable since 1998. Nevertheless, consumption increased by 25% from 1992 to 2002. The main contributor to total fats was the oils and fats category followed by the combined group of red meat, poultry and fish. In 2002, the contribution of oils and fats to total fat consumed stood at 56% compared to 47% a decade ago. This was due mainly to the growing use of salad and shortening oils in salad dressings, deep-fried products and commercially prepared cookies, pastries, specialty breads and croissants. In contrast, the level of fat contributed by the red meat, poultry and fish group dropped to 21% in 2002 from 25 % in 1992. This decrease was due principally to the ongoing decrease in beef consumption.

**Proteins remain stable**

The levels of protein each Canadian consumed remained relatively stable over the last 4 years. The early 1990's saw the start of increasing consumption, rising by 10% from 1992 to 2002. The contribution of total meat (including poultry), the major source of protein, has declined in response to lower beef consumption. Increases in the contribution of poultry, grain products and pulses have partially offset the decline in beef. Fish has consistently contributed 5% of protein to the food supply.

**Vitamin and mineral intake important to diet**

The levels of most vitamins and minerals consumed increased over the last decade. The popularity of fruits and vegetables in Canadian diets has resulted in larger contributions of vitamins C and K from the food supply. The contribution of vitamin E and K has also expanded in response to rising oils and fats consumption. More folate is available due to the increased consumption of fruits and vegetables, cereal products and pulses and nuts.

**Note to readers:** These new experimental data represent food and nutrients consumed. The data are based on estimates of food and nutrients available for consumption that have been adjusted to account for retail, household, cooking and plate loss.

---

## **CONCEPTS, METHODS AND SOURCES**

### **Introduction**

This publication represents a small portion of information available from *Canada Food Stats*, a CD-ROM product. The powerful and friendly system gathers data from across Statistics Canada and even includes data from other organizations. It contains information on food consumption and prices, nutrition, supply and demand, as well as data on the food industry, processing, employment, productivity, imports and much more. In addition, *Canada Food Stats* provides a reservoir of written articles and analysis relevant to food from production to processing to consumption.

Data presented in this bulletin are compiled from a wide variety of sources, both survey and administrative, and from various divisions within Statistics Canada along with other government departments. More information can be obtained from the Statistics Canada web site or by contacting the Agriculture Division directly. As this bulletin features food consumption statistics, a summary of the concepts and methods used for these data series has been provided.

### **CONCEPTS AND METHODS**

Statistic Canada's Agriculture Division has produced data depicting the amount of food that is available for consumption or estimated quantities of food consumed in Canada as far back as 1960. Food available for consumption does not account for losses in stores, households, private institutions or restaurants. Estimated quantities of food consumed are based on availability adjusted for retail, household, cooking and plate loss.

The nutrient consumed tables estimate the amount of each type of nutrient actually consumed on a daily basis by Canadians. They have been derived by adjusting the nutrients available from the Canadian food supply to account for retail, household, cooking and plate loss. As the factors used to adjust the food available data are estimates themselves, considerable caution should be used when working with the data –the data should be viewed as experimental.

The nutritional data are derived by applying nutritional equivalent factors to the retail weight of apparent per capita disappearance data, often used as a proxy for food consumption. The Food Bureau of Agriculture and Agri-Food Canada developed these factors in cooperation with Statistics Canada. The factors were applied to each food or beverage type and then summed to derive subtotals or totals. They remain consistent over time starting in 1976. Consequently, the nutritional data are a subset of the Food Consumption in Canada data series. This data series is more correctly termed per capita disappearance.

Disappearance refers to the amount of food available for consumption and is derived residually using supply-disposition tables. All components of supply are added together and all uses (disposition) other than consumption are deducted. The resulting amount is assumed to be available for human consumption.

To calculate total supply, beginning stocks, production and imports are added together. Net supply is then derived by subtracting disposition items including exports,

manufacturing uses, feed, waste and ending stocks. The net supply is divided by the Canadian population at July 1 to obtain per capita values or disappearance per person.

The data for the numerous supply-disposition tables are obtained from a myriad of survey, administrative and other sources. Each food commodity table is unique.

In general, beginning stocks are those quantities of fresh and frozen food products held in storage at January 1 while ending stocks refer to year-end inventories (December 31). Stock and production data are obtained through surveys of producers and food processors. Import and export data are provided by the International Trade Division of Statistics Canada. Manufacturing data include requirements for processing, seed, animal feed and industrial use. Processed foods are then accounted for directly.

Traditionally, the waste factors attempt to account for quantities removed during processing or lost in storage. They do not allow for losses in stores, households, restaurants or institutions during storage and preparation or for unconsumed food. Consequently, the disappearance data are sometimes referred to as "apparent" to remind users of this data limitation. The nutrients consumed are not apparent but rather represent Statistics Canada's best estimate of actual consumption as the disappearance data were adjusted to account for food losses not previously accounted for.

The new waste adjustment factors account for losses at the retail and consumer levels, including institutions, restaurants and households. The factors attempt to account for losses or waste from storage, in the preparation of food and from the plate. The factors were provided with appreciation from the United States Department of Agriculture. Minor adjustments were made to the factors to take into account that there are some differences between the Canadian and American climate and culture. Further, the waste factors for oils were adjusted upwards in anticipation of expected adjustments to be made by the USDA.

All of the nutrient factors and waste adjustment factors are based on weight. Consequently, the waste adjustments have a limitation in that they may only partially account for losses of some nutrients as a result of cooking. For instance, more (or less) fat, fat soluble nutrients or water soluble nutrients may be wasted depending on the methods used in preparation and cooking. Although every attempt has been made to adjust the nutrient data to estimate actual consumption the data are estimates, a limitation that readers should keep in mind when working with the files. Further, these data refer to nutrients available from food and beverages and do not account for nutrients that may be provided by dietary supplements or from the water supply.

(1) In retail weight. Other Dairy Products excludes cheeses.

(2) In fresh equivalent weight.

(3) In milk solid equivalent; butter included under Oils and Fats.

(4) In edible weight equivalent.

(5) Does not allow for losses, such as waste and/or spoilage, in stores, households, private institutions or restaurants or losses during preparation.
