Note of appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

SYMBOLS

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0^s value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- P preliminary
- r revised
- x suppressed to meet the confidentiality requirements of the Statistics Act
- E use with caution
- F too unreliable to be published

This publication was prepared under the direction of:

- **Mark Elward, Chief,**
Livestock and Animal Products Section
- **Robert Plourde, Unit Head,**
Livestock and Animal Products Section
- **Donald Cutts, Statistical Officer,**

Hog inventories

Third quarter 2004

Canadian hog producers decreased their inventories as exports and prices surged during the third quarter of 2004. Inventories dropped to 14.7 million hogs as of October 1, 2004, a decline of 1.2% from July 1 but modestly above the same time last year.

Producers were able to take advantage of the favourable conditions, including the cooler than normal weather, by heavily feeding their animals to bring them to market sooner. Feed grain prices moderated during the period consistent with the sufficient supplies.

The inventory of market hogs on Canadian farms declined 1.2% while the number of sows remained stable. All major hog producing provinces experienced declines.

Exports of hogs to the United States rose dramatically following the closure of the border to Canadian cattle in May of 2003. During the first 9 months of 2004 exports have spiked to a record 6.3 million hogs. This is 19.9% over the same period in 2003 but 50.2% over 2002 (when the border remained open to Canadian cattle). The gain in exports represents the shipment of 2.1 million more hogs in the first 9 months of this year when compared to the same period in 2002.

With the closure of the U.S. border to Canadian cattle and high demand for beef in the United States, prices for beef have risen to record levels dragging the demand for pork and hogs up. In turn, prices have increased in both countries. Also, with fewer shipments of cattle, there is more than sufficient transportation capacity to carry the hogs south.

Following two years of soft prices and a slump during the second half of 2003, hog prices rebounded in 2004 to levels last seen in 2001. The June 2004 price spiked to an increase of over 60% since the beginning of the year. Although prices have moderated somewhat, the September price was still almost 40% higher than January.

On March 5, 2004, spurred by rising exports, the National Pork Producers Council in the United States filed for anti-dumping and countervailing duties on Canadian hogs. The applications were made to both the U.S. Department of Commerce and the International Trade Commission. These actions add an element of uncertainty to the marketplace, although a preliminary countervail determination by the Department of Commerce was in Canada's favour.

Livestock Statistics – Concepts and Methods

Concepts

Inventory levels of the various types of livestock intended for sale in Canada are measured at specific times throughout the year. Surveyed operations are requested to include all animals located on the farming operation, regardless of ownership. They are also asked to include animals owned but pastured on a community pasture, grazing co-op or public land. Producers are asked to exclude animals owned but kept on a farm, ranch or feedlot operated by someone else. Inventory levels are estimated for cattle, calves, pigs, sheep and lambs. Estimates are also produced for certain categories of animals on the basis of age, sex, weight and/or purpose i.e. breeding or slaughter.

Current information on livestock inventories and related statistics such as supply and disposition enable those active in the agricultural sector to observe and assess changes in the industry, measure performance and keep the agricultural community and general public informed of developments. The primary data users are federal and provincial governments, producer boards, farmers and farm organizations, private business, academic research institutions and students. Livestock data assists governments in formulating agricultural policies and developing programs. Farming organizations use statistics in developing recommendations for producers and governments. Farmers make increasing use of prices, production, and marketing statistics in planning their operations. In addition, these livestock statistics are used in the calculation of farm incomes and in the Canadian System of National Accounts for indicators such as gross domestic product.

Methods

To produce livestock estimates, there are actually 6 different survey occasions. All of the survey occasions collect data primarily using Computer Assisted Telephone Interviews (CATI) although there are special procedures in place for the very large or complex operations.

Two of the occasions are the January Livestock Survey and the July Livestock Survey. These are large-scale general livestock surveys collecting data on cattle, hogs, sheep and other livestock, referring to inventories at the 1st of the month. The probability samples include about 10,000 operations at January 1, and about 28,000 operations at July 1. These surveys collect data during a three-week period in the western provinces, Ontario and Quebec. Regardless of when operators respond, they are asked to report inventories as of January 1 or July 1. The livestock survey results are released, following processing and analysis, approximately seven weeks after the reference date.

Hog inventories are the focus of two other survey occasions collecting estimates of pig numbers at April 1 and October 1. This survey was initiated in 1998 as estimates from 1978 to 1997 were based solely on analytical tools. For the hog surveys, a sub-sample of the prior livestock survey is used. The probability samples are 2,500 at April 1 and October 1 and, similar to the livestock surveys, these CATI surveys cover the western provinces, Ontario and Quebec. Producers are requested to report their inventories as of the reference date, although the data are collected during a 7-day period near or before that date. The hog survey results are normally released three to four weeks after the reference date.

The June and November Atlantic Surveys are used to produce estimates for that region. These surveys are multi-purpose collecting data, primarily inventories, on livestock including cattle,

hogs and sheep in addition to collecting data related to the area, yield and production of the principal field crops. The probability samples are 1,300 in June and 2,200 in November with the data collected by telephone. The results are released at the same time as the livestock results. For reference points where surveys do not exist for the Atlantic region, analytical tools are used to produce the estimates.

Recently a new piece of information has been added to the cattle statistics allowing users a better understanding of the cattle industry. In essence, the total inventories are distributed, on the basis of survey results and sector level balance sheets, to a specific farm type. The two major categories are dairy and beef. The beef sector is then broken down to beef cattle on cow/calf and mixed beef and dairy operations; beef cattle on feeder, stocker/finish operations; and, beef cattle on feeding operations, which include feedlots.

To summarize, the livestock statistics are survey-based estimates. The survey relies on a list frame that is established every five years by the Census of Agriculture and updated to include new entrants, particularly large hog operations. The probability sample surveys are conducted by telephone. The survey results are analysed and corrected before the data are used to analyse the industry and fine-tune the estimates. The survey data are reviewed in a board environment before the commodity analyst works with the data primarily using supply-disposition analysis. The results of the industry analysis are reviewed by the board before being sent to the individual provinces. Once the data are finalised they are released to the public and published. The principal data released include inventories and summarized supply-disposition tables. The data also flow, via farm income estimates, to the Canadian System of National Accounts. In addition the data are used in the calculation of net farm income projections, produced by Agriculture and Agri-Food Canada in co-operation with Statistics Canada and the provinces.
