Note of appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

Symbols

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0^s value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- P preliminary
- r revised
- x suppressed to meet the confidentiality requirements of the Statistics Act
- E use with caution
- F too unreliable to be published

Cattle estimates

July 1, 2004

The Canadian cattle herd jumped 6.5% to a record 16.8 million head as of July 1, 2004, a little over a year after the ban on Canadian cattle and beef because of mad cow disease.

According to the July Livestock Survey of 18,000 farmers, beef and dairy producers had 1 million more head of cattle on their farms than they did on July 1, 2003. This 6.5% increase was due largely to the collapse of export markets for live cattle.

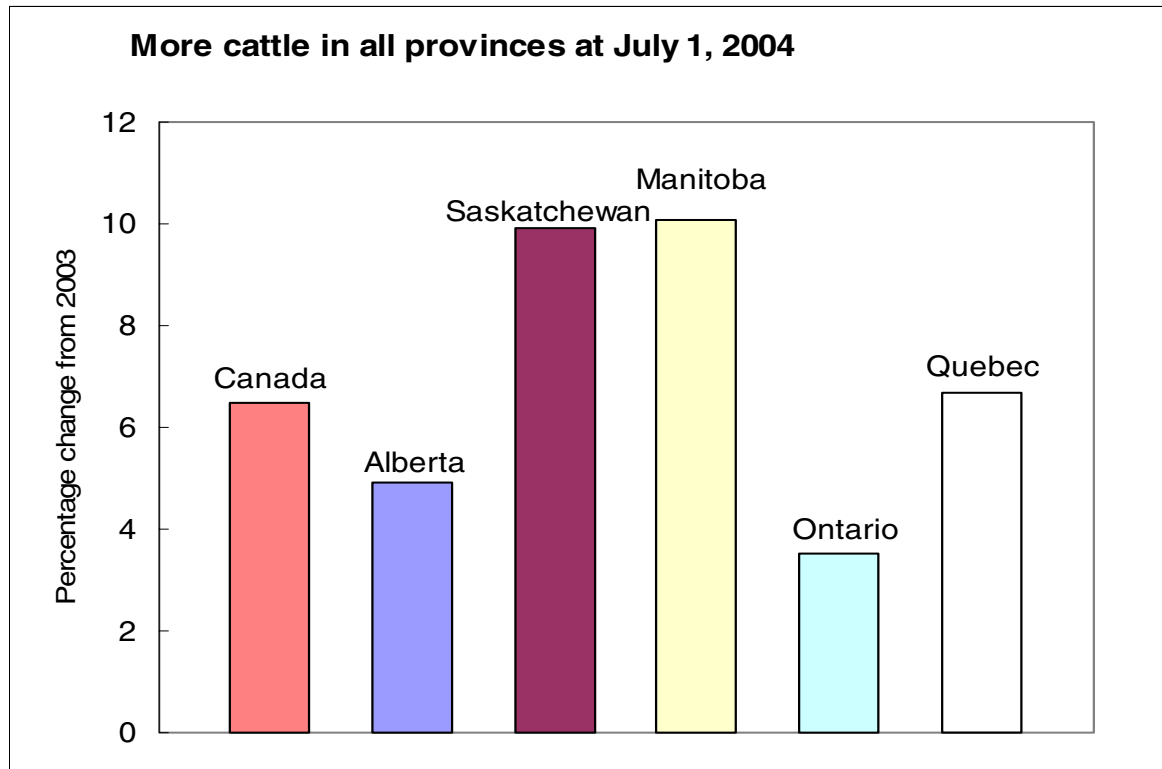

The survey also found that hog inventories climbed 1.4% to 14.8 million head.

Survey results reflect the impact of a ban on Canadian beef following the disclosure of a single reported case of bovine spongiform encephalopathy (BSE), or mad cow disease, on May 20, 2003. The border remained closed to all Canadian beef exports until September 2003.

At that time, the United States, followed by a number of other countries, agreed to allow imports of Canadian boneless beef from animals younger than 30 months under a permit process. Subsequently, on December 23, 2003, a dairy cow in Washington State tested positive for BSE. The origin of this dairy cow was traced to northern Alberta.

Herd sizes rose in all provinces as exports virtually collapsed following the ban. The herd surged 10.0% in Manitoba, the largest increase, while Saskatchewan's went up 9.9%, and Alberta's rose a more modest 4.9%.

Farmers reported increased levels of cattle on all types of operations. Cow-calf producers reported 9.7 million animals, up 2.7% while the number of cattle on back-grounding operations jumped 24% to stand at 3.2 million. Meanwhile, the number of cattle on feeding operations, which totalled 1.5 million, increased 5.3%.

Western Canadian farmers account for three-quarters of the national herd. Alberta alone represented 38.2% or 6.4 million animals as of July 1, 2004.

Exports plunge in the wake of border closures

Since the late 1980s, the Canadian cattle industry has expanded to the point where it was worth an estimated \$7.7 billion a year to farmers in 2002. This expansion coincided with freer trade, and was primarily driven by exports to the United States. Domestic consumption remained stable or declined until 2003, when beef consumption increased 5% from 2002 to 14.2 kilograms per person.

Canada's exports of cattle and beef meat to all countries virtually collapsed after the ban was imposed last May. The vast majority are destined for the United States.

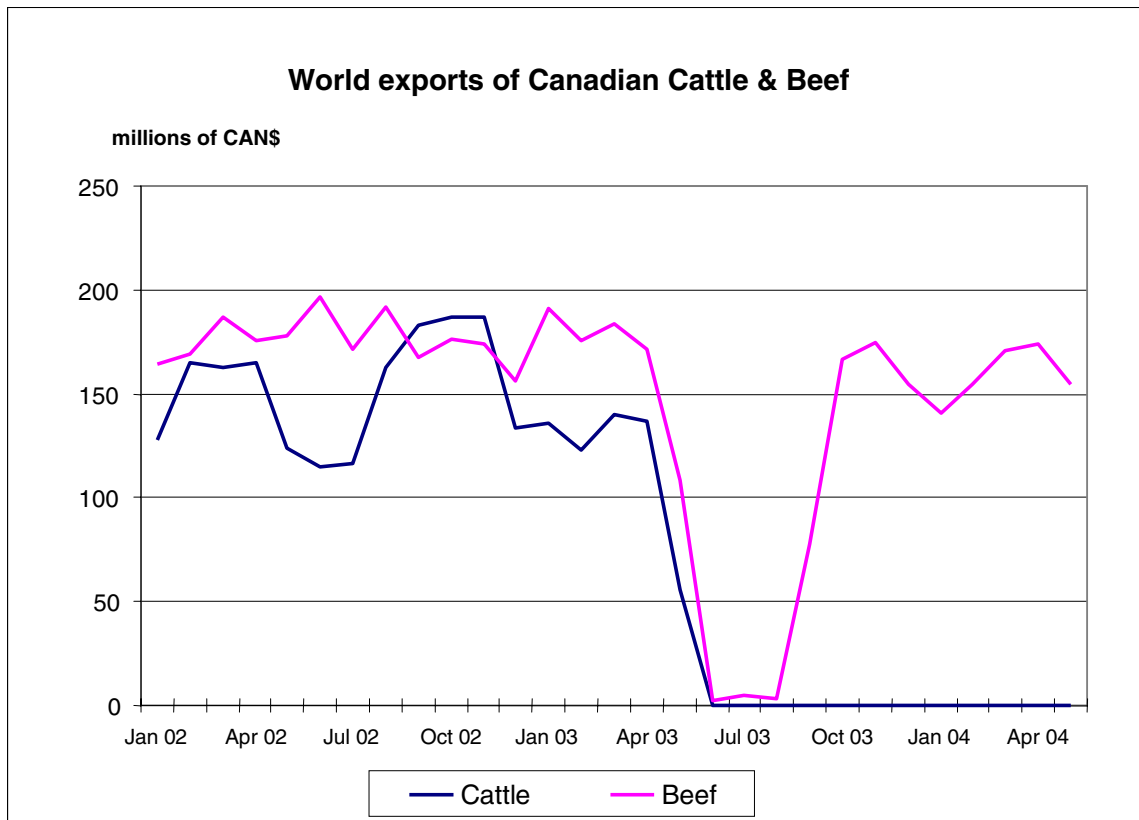

In 2002, Canada exported 1.7 million head of cattle, worth \$1.8 billion. With the border closed in May 2003, cattle exports plunged to 505,689 head, valued at \$591 million, some

30% of the previous year's level. Exports of live animals in 2004 are non-existent so far, as the border continues to be closed.

Exports of beef have also dropped dramatically from the \$2.1 billion worth registered in 2002. About 84% of Canada's beef exports are destined for American dinner plates.

Although there is some monthly variation, exports of beef from Canada dropped to 789 tonnes in June 2003, staying extremely low until September. At that point, the United States started to allow some beef products into the country and exports climbed during the fall, almost reaching pre-BSE levels (about 40,000 tonnes per month). In January, monthly exports dipped before rising to close in on the pre-BSE levels.

In 2003, the value of beef exports fell 33% from 2002. For the first four months of 2004, beef exports were down 11.3% when compared to the value in 2003 prior to discovery of the BSE infected animal.

Source: Canadian International Merchandise Trade, International Trade Division

In dollar value, for 2002 as a whole, total cattle and beef exports reached \$3.9 billion, the equivalent of \$11 million in sales each day. For the 12-month period from June 2003 to May 2004 following the border closure, the total value of cattle and beef exports was estimated at \$1.4 billion, down 65% from the 2002 benchmark.

In the meantime, domestic slaughter rose 17.4% to a record 2.1 million animals in the first six months of 2004, as beef imports tumbled to less than one-third of pre-BSE levels. In addition, domestic demand for beef remains strong.

Prices and cash receipts tumble

Prices for all cattle – slaughter animals, feeders as well as calves – tumbled because of the domestic oversupply resulting from the plunge in exports.

Prices for slaughter cattle were hardest hit. For example, the July 2003 price for slaughter cattle in Alberta was about 35% of the price before the borders closed. It has struggled upward since then, and in March amounted to 76% of prices last seen in the spring of 2003. This collapse was mirrored across the country.

Feeder cattle prices were also adversely affected, although the impact was less severe, prices have been volatile. In Alberta, prices for feeder cattle fell about 40% and were still down 15% in April 2004.

Meanwhile, American farmers are enjoying record prices. The drop in the U.S. herd, coupled with the border closure, tightened the beef supply in the United States at the same time as demand is strong.

Farmers' cash receipts for cattle and calves during the third and fourth quarters of 2003 were cut in half, tumbling to \$2.0 billion from the \$3.9 billion recorded for the same period in 2002.

Government payment programs will help cushion the shock for farmers. The main program, Bovine Spongiform Encephalopathy Recovery Program, is estimated to have paid \$443 million to producers between July and December 2003.

Livestock Statistics – Concepts and Methods

Concepts

Inventory levels of the various types of livestock intended for sale in Canada are measured at specific times throughout the year. Surveyed operations are requested to include all animals located on the farming operation, regardless of ownership. They are also asked to include animals owned but pastured on a community pasture, grazing co-op or public land. Producers are asked to exclude animals owned but kept on a farm, ranch or feedlot operated by someone else. Inventory levels are estimated for cattle, calves, pigs, sheep and lambs. Estimates are also produced for certain categories of animals on the basis of age, sex, weight and/or purpose i.e. breeding or slaughter.

Current information on livestock inventories and related statistics such as supply and disposition enable those active in the agricultural sector to observe and assess changes in the industry, measure performance and keep the agricultural community and general public informed of developments. The primary data users are federal and provincial governments, producer boards, farmers and farm organizations, private business, academic research institutions and students. Livestock data assists governments in formulating agricultural policies and developing programs. Farming organizations use statistics in developing recommendations for producers and governments. Farmers make increasing use of prices, production, and marketing statistics in planning their operations. In addition, these livestock statistics are used in the calculation of farm incomes and in the Canadian System of National Accounts for indicators such as gross domestic product.

Methods

To produce livestock estimates, there are actually 6 different survey occasions. All of the survey occasions collect data primarily using Computer Assisted Telephone Interviews (CATI) although there are special procedures in place for the very large or complex operations.

Two of the occasions are the January Livestock Survey and the July Livestock Survey. These are large-scale general livestock surveys collecting data on cattle, hogs, sheep and other livestock, referring to inventories at the 1st of the month. The probability samples include about 10,000 operations at January 1, and about 28,000 operations at July 1. These surveys collect data during a three-week period in the western provinces, Ontario and Quebec. Regardless of when operators respond, they are asked to report inventories as of January 1 or July 1. The livestock survey results are released, following processing and analysis, approximately seven weeks after the reference date.

Hog inventories are the focus of two other survey occasions collecting estimates of pig numbers at April 1 and October 1. This survey was initiated in 1998 as estimates from 1978 to 1997 were based solely on analytical tools. For the hog surveys, a sub-sample of the prior livestock survey is used. The probability samples are 2,500 at April 1 and October 1 and, similar to the livestock surveys, these CATI surveys cover the western provinces, Ontario and Quebec. Producers are requested to report their inventories as of the reference date, although the data are collected during a 7-day period near or before that date. The hog survey results are normally released three to four weeks after the reference date.

The June and November Atlantic Surveys are used to produce estimates for that region. These surveys are multi-purpose collecting data, primarily inventories, on livestock including cattle,

hogs and sheep in addition to collecting data related to the area, yield and production of the principal field crops. The probability samples are 1,300 in June and 2,200 in November with the data collected by telephone. The results are released at the same time as the livestock results. For reference points where surveys do not exist for the Atlantic region, analytical tools are used to produce the estimates.

Recently a new piece of information has been added to the cattle statistics allowing users a better understanding of the cattle industry. In essence, the total inventories are distributed, on the basis of survey results and sector level balance sheets, to a specific farm type. The two major categories are dairy and beef. The beef sector is then broken down to beef cattle on cow/calf and mixed beef and dairy operations; beef cattle on feeder, stocker/finish operations; and, beef cattle on feeding operations, which include feedlots.

To summarize, the livestock statistics are survey-based estimates. The survey relies on a list frame that is established every five years by the Census of Agriculture and updated to include new entrants, particularly large hog operations. The probability sample surveys are conducted by telephone. The survey results are analysed and corrected before the data are used to analyse the industry and fine-tune the estimates. The survey data are reviewed in a board environment before the commodity analyst works with the data primarily using supply-disposition analysis. The results of the industry analysis are reviewed by the board before being sent to the individual provinces. Once the data are finalised they are released to the public and published. The principal data released include inventories and summarized supply-disposition tables. The data also flow, via farm income estimates, to the Canadian System of National Accounts. In addition the data are used in the calculation of net farm income projections, produced by Agriculture and Agri-Food Canada in co-operation with Statistics Canada and the provinces.
