Standards of service to the public

Statistics Canada is committed to serving its clients in a prompt, reliable and courteous manner and in the official language of their choice. To this end, the Agency has developed standards of service that its employees observe in serving its clients. To obtain a copy of these service standards, please contact Statistics Canada toll free at 1 800 263-1136. The service standards are also published on www.statcan.ca under About Statistics Canada > Providing services to Canadians.

Note of appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

Symbols

The following standard symbols are used in Statistics Canada Publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0^s value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- ^p preliminary

Cattle estimates

January 1, 2006

Canada's national cattle herd has declined for the first time in three years in the wake of the reopening of the American border to Canadian cattle, easing the situation for farmers who had to feed record numbers of animals.

Cattlemen had an estimated 14.8 million head on their farms as of January 1, 2006, a drop of about 233,000 head from the record 15.1 million head established a year earlier, according to the January Livestock Survey of 10,000 producers.

Despite the decline, the total was still over 1.3 million higher than levels as of January 1, 2003, before the worldwide ban on Canadian cattle resulting from mad cow disease.

Livestock inventories at January 1						
	Cattle		Hogs		Sheep	
	'000 of head

British Columbia	710	660	172	167	66	70
Note: Figures may not add up to totals because of rounding.						

The ban on Canadian cattle and beef took effect following the disclosure of a single reported case of bovine spongiform encephalopathy (BSE) on May 20, 2003. The border remained closed to all Canadian beef until September 2003 and to live cattle until July 18, 2005, when it was opened to cattle under 30 months of age.

The BSE crisis left Canadian cattlemen having to feed record-high levels of cattle on their farms. It also crippled the nation's multi-billion-dollar cattle and beef exports to the world for 26 months.

Quick jump in exports of live cattle

Exports of live cattle to the United States rose rapidly once the border was reopened in July. By October 2005, they were closing in on pre-BSE levels.

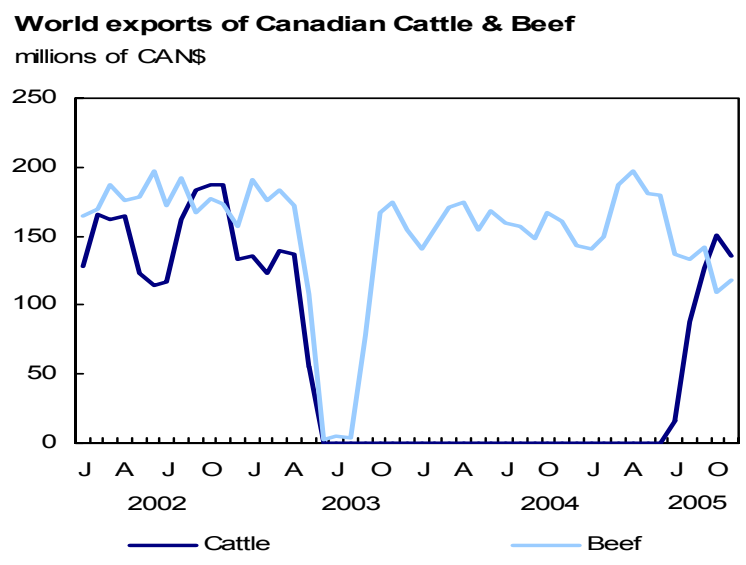

Exports for October reached 133,000 head, approaching average monthly exports for 2002 (pre-BSE) of 140,000 head. In November 2005, cattle exports dipped to 118,000 head.

Partially offsetting the surging cattle exports was a drop in beef meat exports during the second half of 2005. Beef exports spiked in April 2005 but declined 36% to 28,600 metric tonnes in November.

Part of the decline can be attributed to the three-week strike at Lakeside Packers in Alberta in late October and early November of 2005.

In 2002, pre-BSE, total cattle and beef exports hit \$3.9 billion, the equivalent of \$11 million in sales each day.

By 2004, the value of these exports had plunged to only \$1.9 billion, less than half of the 2002 levels. With the border open to both cattle and beef, the value of daily exports has recently climbed to \$8.4 million.

Cattle herd declines in all regions

Cattle numbers have declined in all cattle producing provinces except in Manitoba where they remained stable. Alberta's herd, the largest of any province, edged down a modest 0.5% from the same date in 2005, while Saskatchewan's fell 3.0%.

Alberta and Saskatchewan combined accounted for almost 60% of all cattle on Canadian farms as of January 1, 2006.

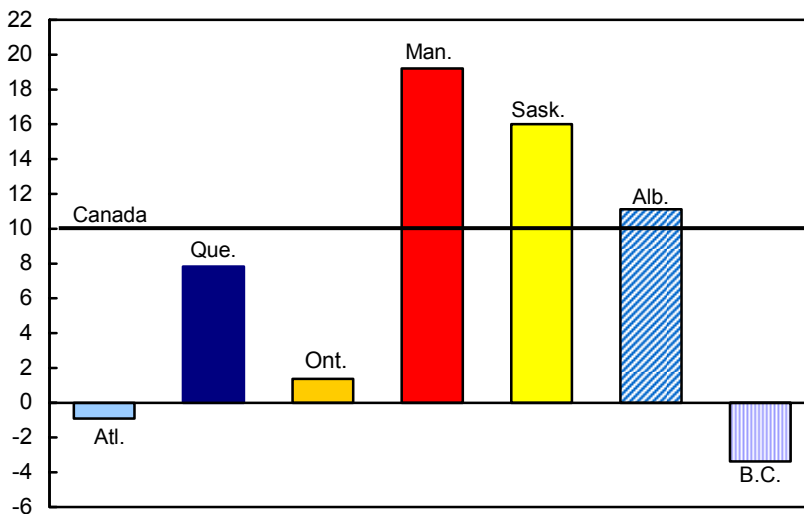

At the same time, the number of head of cattle on British Columbia's farms plunged 7.0% while in Manitoba the herd lingered at the January 2005 level. In central Canada, Quebec's cattle herd shrunk 0.7%, while Ontario's was 2.3% lower.

The Prairie Provinces accounted for the vast majority of the increase in cattle numbers during the three-year period before January 1, 2006. Combined, those three provinces climbed by 1.2 million head, 92% of the overall gain of 1.3 million.

Manitoba's cattle numbers shot up 19.2% over the past three years, while in Saskatchewan the herd expanded 16.0%. Alberta's cattle inventories rose 11.1%, accounting for some 44% of the national gain.

BSE impacts cattle inventories as of January 1, 2006

% change from January 2003

Slaughter remains at unprecedented levels

Slaughter levels have been a key factor that has also affected the cattle business.

First, slaughter has climbed to record levels. In 2005, slaughter was only a modest 1.0% above the 2004 record levels but it was an impressive 27.5% above those in 2003.

These gains were fuelled by increased slaughter capacity, domestic demand, strong international demand for Canadian beef, and lower levels of beef imports.

Slaughter prices improved during the fall of 2005 rising 20% above the same period in 2004. The December 2005 prices amounted to 94% of prices experienced during December 2002, before the ban was imposed.

Cull cows retained

The January Livestock Survey shows that producers are holding on to fewer cull cows. There were 704,200 cull cows in Canada, representing 11.1% of the 6.3 million cows held on farms at January 1, 2006.

Cattle producers conveyed that 30.2% of all cows or 1.9 million head were over 7 years of age. (In 1997, specific products were banned for use as cattle feed.) Beef cows were generally older. About 33.6% of all beef cows were over 7 years of age, representing 1.8 million animals. On the other hand, dairy producers maintained fewer older animals, reporting 12.7% in this group.

Lighter animals accounted for 30.8% of the 2.2 million feeder cattle. At the other end of the scale, some 38.1% of the feeder cattle were in the heavy category.

Farmers also pointed out that two-thirds of the total feeder animals, or 1.4 million head, were being fed a finishing ration. The higher energy ration results in much faster weight gains meaning that these animals will be slaughter-ready sooner than if they were fed a roughage ration. Further, it was reported that the vast majority of the feeder cattle, or 83%, were less than 21 months of age as of January 1, 2006.

Livestock Statistics – Concepts and Methods

Concepts

Inventory levels of the various types of livestock intended for sale in Canada are measured at specific times throughout the year. Surveyed operations are requested to include all animals located on the farming operation, regardless of ownership. They are also asked to include animals owned but pastured on a community pasture, grazing co-op or public land. Producers are asked to exclude animals owned but kept on a farm, ranch or feedlot operated by someone else. Inventory levels are estimated for cattle, calves, pigs, sheep and lambs. Estimates are also produced for certain categories of animals on the basis of age, sex, weight and/or purpose i.e. breeding or slaughter.

Current information on livestock inventories and related statistics such as supply and disposition enable those active in the agricultural sector to observe and assess changes in the industry, measure performance and keep the agricultural community and general public informed of developments. The primary data users are federal and provincial governments, producer boards, farmers and farm organizations, private business, academic research institutions and students. Livestock data assists governments in formulating agricultural policies and developing programs. Farming organizations use statistics in developing recommendations for producers and governments. Farmers make increasing use of prices, production, and marketing statistics in planning their operations. In addition, these livestock statistics are used in the calculation of farm incomes and in the Canadian System of National Accounts for indicators such as gross domestic product.

Methods

To produce livestock estimates, there are actually 6 different survey occasions. All of the survey occasions collect data primarily using Computer Assisted Telephone Interviews (CATI) although there are special procedures in place for the very large or complex operations.

Two of the occasions are the January Livestock Survey and the July Livestock Survey. These are large-scale general livestock surveys collecting data on cattle, hogs, sheep and other livestock, referring to inventories at the 1st of the month. The probability samples include about 10,000 operations at January 1, and about 18,000 operations at July 1. These surveys collect data during a three-week period in the western provinces, Ontario and Quebec. Regardless of when operators respond, they are asked to report inventories as of January 1 or July 1. The livestock survey results are released, following processing and analysis, approximately seven weeks after the reference date.

Hog inventories are the focus of two other survey occasions collecting estimates of pig numbers at April 1 and October 1. This survey was initiated in 1998 as estimates from 1978 to 1997 were based solely on analytical tools. For the hog surveys, a sub-sample of the prior livestock survey is used. The probability samples are 2,500 at April 1 and October 1 and, similar to the livestock surveys, these CATI surveys cover the western provinces, Ontario and Quebec. Producers are requested to report their inventories as of the reference date, although the data are collected during a 7-day period near or before that date. The hog survey results are normally released three to four weeks after the reference date.

The June and November Atlantic Surveys are used to produce estimates for that region. These surveys are multi-purpose collecting data, primarily inventories, on livestock including cattle,

hogs and sheep in addition to collecting data related to the area, yield and production of the principal field crops. The probability samples are 1,300 in June and 2,200 in November with the data collected by telephone. The results are released at the same time as the livestock results. For reference points where surveys do not exist for the Atlantic region, analytical tools are used to produce the estimates.

Recently a new piece of information has been added to the cattle statistics allowing users a better understanding of the cattle industry. In essence, the total inventories are distributed, on the basis of survey results and sector level balance sheets, to a specific farm type. The two major categories are dairy and beef. The beef sector is then broken down to beef cattle on cow/calf and mixed beef and dairy operations; beef cattle on feeder, stocker/finish operations; and, beef cattle on feeding operations, which include feedlots.

To summarize, the livestock statistics are survey-based estimates. The survey relies on a list frame that is established every five years by the Census of Agriculture and updated to include new entrants, particularly large hog operations. The probability sample surveys are conducted by telephone. The survey results are analysed and corrected before the data are used to analyse the industry and fine-tune the estimates. The survey data are reviewed in a board environment before the commodity analyst works with the data primarily using supply-disposition analysis. The results of the industry analysis are reviewed by the board before being sent to the individual provinces. Once the data are finalised they are released to the public and published. The principal data released include inventories and summarized supply-disposition tables. The data also flow, via farm income estimates, to the Canadian System of National Accounts. In addition the data are used in the calculation of net farm income projections, produced by Agriculture and Agri-Food Canada in co-operation with Statistics Canada and the provinces.
