## **1999 income: an overview**

### **Market income**

Average market income for Canadian families of two or more people was \$56,998 in 1999, up 1.4% from the previous year after adjusting for inflation. This marks the sixth consecutive year of positive growth, although at a slower rate than in the two previous years. Average market income has increased by 13.6% since 1993 when it was at a low for the decade of \$50,192.

Average market income for persons not living in families (unattached individuals) was \$22,038 in 1999, up 4.3% from the previous year. This was the second year in a row that the growth in average market income of unattached individuals exceeded 4%. Mainly because of these recent increases, the average market income of unattached individuals returned to about the same level as the peak reached in 1989.

### **Distribution of market income**

If families are ranked by their income level from lowest to highest, the top 20% of families earned 44.4% of all market income in 1999, compared to 3.5% for the bottom 20% of families. For every dollar earned by the bottom 20%, nearly 13 dollars were earned by the top 20%.

### **Average government transfers declined about 3 percent**

On average, families of two or more persons received an estimated \$6,821 in government transfers in 1999, a decline of 3.3% from 1998. Government transfers to families peaked in 1993, and have fallen 8.0% since then.

Unattached individuals received \$5,020 on average in transfers in 1999, down 2.9% from 1998 and 10.0% from the peak reached in 1994.

### **Total income**

When all income sources are considered, Canadian economic families received an average of \$63,818 in total income in 1999, up 0.9% from 1998. Average total income for unattached individuals was \$27,058, an increase of 2.9%. Total family income increased 10.8% since 1993, the decade's lowest level.

For the 20% of families with the lowest incomes, government transfers contributed about half (50.8%) of all income received in 1999. For families in the top quintile, only 3.2% came from transfers. Because of transfers, the distribution of total income is more "equal" than market income. On the basis of total income, the top 20% of families received about six and a half dollars for every dollar received by the bottom quintile. In aggregate terms, the top 20% of families got 40.9% of total income, versus 6.3% for the bottom 20% of families. This is a slightly more unequal distribution than ten years ago, when the shares were 39.1% and 6.4%.

### **Drop in income taxes**

In 1999, the average family paid \$12,346 in income taxes. This is a decrease of 2.8% from 1998, when taxes were at the highest level in the 1990s.

The proportion of tax paid by each income group has shifted in the last ten years. The proportion of taxes paid by families in the bottom quintile has increased but remains relatively low, having gone from 1.6% in 1990 to 1.9% in 1999. Families in the highest quintile also paid a somewhat larger share of taxes in 1999, accounting for 51.8% of aggregate income taxes versus 48.7% in 1990.

### **After-tax income**

The average family had an estimated \$51,473 in after-tax income in 1999, up 1.9% from 1998. For unattached individuals, the average after-tax income was \$22,064, up 2.7% from the previous year.

Like transfers, taxes reduce income inequality. The top 20% of families received 38.3% of all after-tax dollars compared with 7.4% for the bottom quintile, a ratio of 5 to 1.

### **Fewer families in low income in 1999**

An estimated 723,000 families were in low income after tax in 1999, down from 737,000 in 1998. The family low income rate was 8.6%, the lowest rate since 1990 (8.5%). The situation of families below the low income cutoff also showed some improvement. These families would have needed, on average, an additional \$6,262 in after tax dollars to reach the low income cutoff, compared to \$6,690 in 1998.

Among unattached individuals, 1,280,000 were in low income in 1999, virtually the same as in 1998. On average, they would have needed an additional \$5,047 to rise above the low income cutoff in 1999.

The low income rate for persons dropped as well. In 1999, 11.8% of all Canadians, about 3.6 million persons, were in low income based on income after tax. After climbing throughout the early 1990s, the prevalence of low income peaked in 1996, at 14.0%, and has declined over the last three years.

In 1999, 962,000 children were in low income families, down from 978,000 in 1998. The proportion of children living in low income families has been falling since 1996 when it peaked at 16.8% on an after-tax basis. The rate then fell to 13.9% in 1998 and 13.7% in 1999.

### **Low income touches more than one in five over a six-year period**

About 24.1% of Canadians experienced low income at least one year during the six-year period starting with 1993. This reflects the fact that, for some, low income is a transitory state. About 8.0% of individuals experienced one year of low income and 4.8% experienced two years (not necessarily consecutive). At the other extreme, 3.3% of the population remained in low income throughout the period from 1993 to 1998.

### **Impact of transfers and taxes across family types**

The average married couple with no children at home earned about \$59,854 in market income in 1999. They received an additional \$3,336 in government transfers, but paid out \$13,278 in taxes. So, on average, they received \$49,912 after tax; after netting out taxes and transfers, they retained 83.4% of their market income.

Dual-earner parents had higher market income (\$70,499) and higher after-tax income (\$58,063) but the portion of market income they retained was much the same, at 82.4%. Single-earner couples with children had substantially lower levels of market income in 1999, \$47,828 on average. But with somewhat higher government transfers and lower income tax, their after-tax income, at \$42,898, was 89.7% of their market income.

Lone-parent families averaged \$22,763 in market income in 1999. They received more in government transfers than they paid in taxes, so that after-tax income was higher, at \$26,823. The same is true for families headed by a senior. Their market income averaged \$25,937 while after-tax income was \$38,846 in 1999. Unattached seniors, particularly senior women, registered very low levels of income. Senior unattached men averaged \$22,577 after tax and, senior women, \$18,427.

# Chapter 1: Introduction

---

This report examines family income and low income in Canada. The data are drawn from two household surveys: the Survey of Consumer Finances (SCF) and the Survey of Labour and Income Dynamics (SLID). For readers who are familiar with the SCF program, this new annual report replaces the series of publications traditionally produced by SCF<sup>1</sup>. *Income in Canada* contains the key tables from the previous publication series, as well as several new ones. Historical data prior to 1996 are drawn from the SCF and data since 1996 are taken from SLID.

The publication is organized into chapters, each dealing with a specific income concept. Each chapter has a short analytical article, followed by data tables. Background information on the data sources, notes and definitions, survey methodology and data quality is presented at the end of the publication. Chapter 2 examines market income, also known as “income before transfers”. It represents the money people earned from the labour market, investments and private pensions. Chapter 3 looks at government transfer payments, focusing on specific groups or family types (such as the elderly, lone-parent families and families that had no earner) that are the target beneficiaries of most income security programs. Chapter 4 deals with the total income of Canadian families. The role of government transfers in total income is also examined. Chapter 5 presents information on income tax and how it varied by family type. Chapter 6 examines after-tax income. The joint effect of transfers and income taxes is assessed. Chapter 7 revisits all the income concepts and focuses on broad trends. Chapter 8 concentrates on low income in Canada, including low income persistence. Chapter 9 presents tables on family and person estimates underlying the time series covered in this publication.

The tables and charts in this publication show data for at most a ten-year time-span, due to space constraints. The companion product to this publication — a compilation of tables on CD-ROM called *Income Trends in Canada* — replicates all of the tables in this publication but for the period starting with 1980. It also contains data for 15 metropolitan areas in addition to provincial data. Tables on earnings (the major component of market income) and other related income concepts or statistics are also shown. For more information on *Income Trends in Canada*, or to order this CD-ROM (at a cost of \$195), please refer to the last section in this publication, «Related Products and Services».

---

<sup>1</sup> For a listing of SCF publications, see *Related Product and Services*.

When assessing data trends over time, there is always the choice of time period on which to make comparisons. Obviously, the commentary in the following chapters focuses on what's «new», the most recent year of data available. But it also draws on trends over the previous several years. Over the past twenty years, the most notable events in the business cycle (a popular phrase for economic upturns and downturns) were the recessions in the early 1980s (about 1982 to 1983) and the early 1990s (about 1991 to 1993). Between these two reference points, 1989 stood out as a «peak» year for real incomes of families, which was not surpassed until 1998. Our 1998 edition highlighted those comparisons. For 1999, we have highlighted the lengthy upwards trend of average real incomes since the low-point for family incomes during this decade, in most cases 1992 or 1993.

Finally, «structural» changes regarding income, such as in the distribution of incomes across the population, tend to require a longer time period to reveal notable changes. When commenting on income distribution, such as quintile analysis or the Gini Coefficient, we often use a standard ten-year comparison for ease of presentation. For analysis at the provincial level, it is again preferable to look at a longer trend for the purpose of separating real trends in income levels from relatively small but arbitrary changes that could be caused by smaller sample sizes at the provincial level.

To factor in inflation when comparing income levels across time, all the income estimates are expressed in constant dollars of the last year for which data are presented.

## Chapter 2: Market Income

---

*Market income includes the earnings that Canadians receive from their labour force participation. Also included in market income is investment and private pension income. For the majority of Canadians, particularly those of "working age", money from employment constitutes a high proportion of market income. In 1999, 87.2% of aggregate market income came from employment.*

### **Continued growth, but at a slower pace**

Average market income for Canadian families of two or more people was \$56,998 in 1999, up 1.4% from the previous year after adjusting for inflation (as measured by changes in the Consumer Price Index). This marks the sixth consecutive year of positive growth, although at a slower rate than in the two previous years. Average market income has increased by 13.6% since 1993 when it was at a low for the decade of \$50,192.

Average market income for persons not living in families (unattached individuals) was \$22,038 in 1999, up 4.3% from the previous year. This was the second year in a row that the growth in average market income of unattached individuals exceeded 4%. Mainly because of these recent increases, the average market income of unattached individuals returned to about the same level as the peak reached in 1989.

### **Growth rates differ among provinces**

Average market income of families in 1999 was 5.2% higher than that in 1990. Prince Edward Island had the largest provincial growth rate over the decade (12.1%). Four other provinces had growth rates higher than the overall average: New Brunswick, Alberta, Saskatchewan and Ontario. Newfoundland was slightly below average. Although the decrease was less than one percent, average market income of families in Nova Scotia and British Columbia dropped from the beginning to the end of the decade. In 1999, average market income was highest in Ontario, estimated at \$65,429, followed by Alberta (\$60,447) and British Columbia (\$57,131).

**Chart 2.1**

**Average market income of economic families and unattached individuals, 1990-1999**

**The labour market continues to improve**

The growth in market income was driven mainly by labour market conditions. In 1999, Canada experienced strong economic growth for the third year in a row and accelerated employment growth as well. Real Gross Domestic Product (GDP) grew 4.3% in 1999 after rising 3.1% in 1998. At the same time, employment rose 2.8% in 1999, its best performance of the decade. In particular, the number of Canadians working full-time increased

3.3% from 1998. As well, the proportion of families in which at least one member experienced unemployment at some time in the year declined from 26.4% in 1998 to 21.0% in 1999. Ontario, Newfoundland and New Brunswick experienced higher employment growth than the average for Canada as a whole. These two Atlantic provinces were also the two provinces that had the highest increases in market income in 1999.

**Third consecutive year of growth for two-parent families**

The market income of two-parent families increased for the third year in a row (2.5%), but at a slower rate than in 1998 (5.4%) and 1997 (4.0%). Their 1999 market income was 9.0% higher than at the beginning of the decade and 15.7% higher than in 1993.

**Senior families' incomes increase**

While some family types experienced a fall in their market income between 1998 and 1999, the income of families in which the main income earner was a senior grew 8.6%, the largest increase among the main family types. In fact, for this group all sources of market income (pensions, investment income and earnings) increased sharply.

After a large increase between 1997 and 1998, the market income of female lone-parent families was virtually unchanged between 1998 and 1999. These families received an average of \$19,469 in market income, approximately 28% as much as two-parent families.

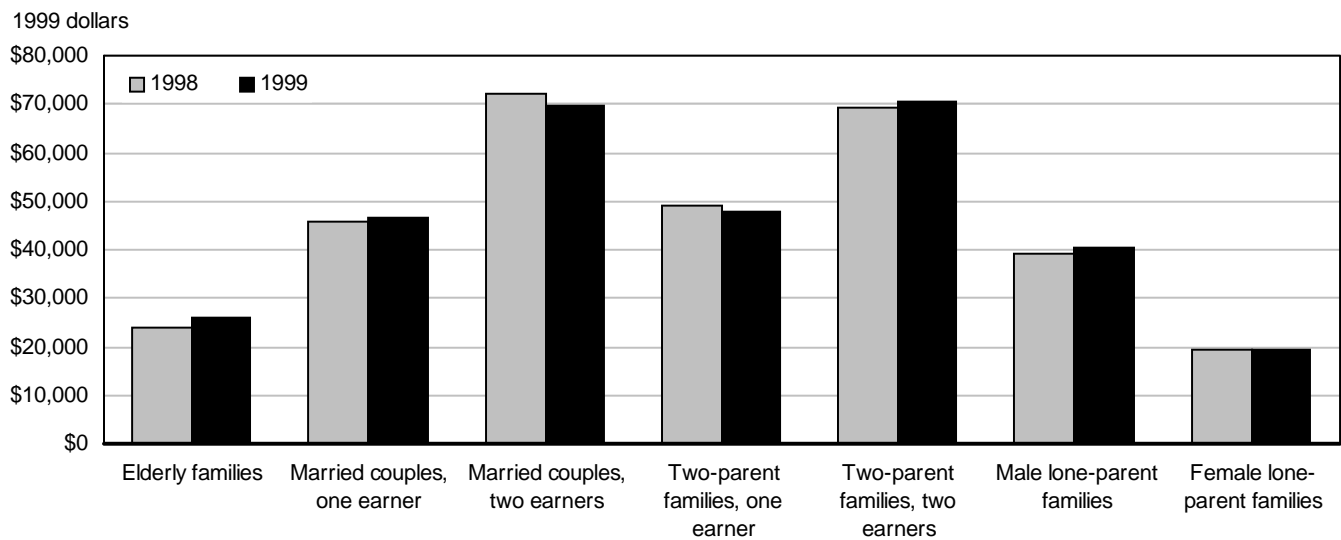

**Chart 2.2**

**Average Market Income Canada and the Provinces, percentage change, between 1990 and 1999**

**Chart 2.3**

**Average Market Income by Major Family Type, 1998 and 1999**

**Widespread increase in market income by income quintiles**

With the exception of families in the highest quintile, for whom there was virtually no change, average market income for each quintile was higher in 1999 than the previous year.

In 1999, average market income for Canadian families in the top quintile of the income scale was \$126,451, about 13 times higher than families in the bottom quintile. In 1998, this ratio was 14 to 1. Similarly, Canadian families in the bottom quintile received 3.5% of aggregate market income, up from 1998, while the share of those in the top quintile was 44.4%, down from 1998.

## Chapter 3: Government Transfers

---

*Government transfers cover a range of programs. For example, Employment Insurance provides temporary income assistance to those who lose their job or are absent for reasons of illness or the birth of a child. The Canada Pension Plan and the Quebec Pension Plan are the two public pension plans in Canada. Old Age Security, including the Guaranteed Income Supplement, provides financial support to seniors. Child tax benefits and other child credits or allowances are aimed at families with children. Other government transfers include social assistance from provincial and municipal programs, Worker's Compensation benefits, the GST/HST Credit and provincial refundable tax credits such as the Quebec and Newfoundland sales tax credits. The implicit transfer rate shows the amount received from all these sources as a proportion of total income.*

### **Average government transfers declined about 3 percent**

Families of two or more persons received on average \$6,821 in government transfers in 1999, a decline of 3.3% from 1998 after adjusting for inflation. In relative terms also, a slightly smaller proportion of their total income was in the form of transfers than in 1998 (10.7% compared to 11.2%). Unattached individuals received \$5,020 on average in government transfers in 1999, a drop of 2.9%, and their transfer rate went from 19.7% to 18.6%.

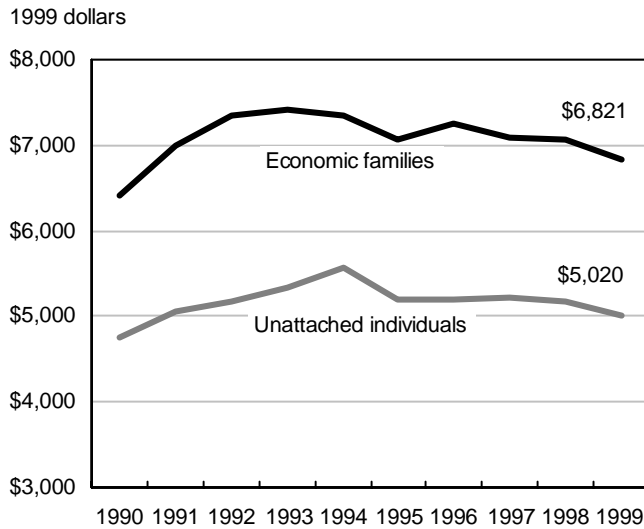

In both cases, the declines were concentrated among non-seniors. In 1999, average transfers for families in which the main income earner was under 65 were an estimated \$4,825, a drop of 5.9%. Unattached individuals under age 65 averaged \$2,324 in transfers, or 6.9% less than the previous year.

### **Lower transfers as a result of higher market income**

The overall transfer rate for families has continued on a downward trend since 1993, when it reached a peak for the decade of 12.9%. As in 1998, the most recent decline is partly the result of the improved economy and higher employment. An example of a government program which is particularly sensitive to changes in the job market is Employment Insurance. After falling by close to 3% in 1998, the number of EI recipients fell a further 7.2% in 1999.

**Chart 3.1**

**Average Government Transfers for Families and Unattached Individuals, 1990 to 1999**

**Smaller declines in transfers for families with children than those without**

Of the main economic family types, non-elderly married couples without children experienced the largest declines in average government transfers, whether they lived on their own (-10.9%) or with other relatives (-8.3%). Families with children — both two-parent families and lone-parent families — posted smaller declines of 3.6% and 2.4%, respectively.

The number of families receiving child tax benefits or similar benefits decreased by close to 100,000 in 1999 to approximately 3.1 million, but the average amount of benefits received per family increased by 3.7% to \$2,067.

Two-parent families with no earner received on average \$16,238 in the form of government transfers, of which 85.5% came from social assistance and child tax benefits. At an aggregate level government transfers represented 78.9% of the total income of these families. Lone-parent mothers without earnings received \$13,351 from government sources, which represented 89.0% of their total income. This dollar amount was 5.1% higher than the previous year, and resulted largely from a 16.5% increase in the average amount of child tax benefits that

these families received. The implicit transfer rate of all female lone-parent families was virtually unchanged in 1999 (29.4%) compared to the previous year.

**Shares of transfers by income quintile remain unchanged**

Many, though not all, government transfers are designed to supplement the incomes of lower income families and individuals. Families in the bottom income quintile received the largest share of total government transfers, at 30.1%, compared to 12.2% received by families in the highest quintile.

**Chart 3.2**

**Transfers as Proportion of Total Income by Quintiles for Families, 1990 and 1999**

**Government transfers to seniors**

Government transfers typically make up a large proportion of the income received by Canada's seniors. In 1999, 42.5% of the income received by elderly families came from government transfers, compared to 44.6% in 1998. This group had a sizeable increase in market income in 1999. As for seniors living alone, 54.2% of their total income came from government transfers in 1999, virtually unchanged from the previous year.

In particular, older women living alone relied heavily on transfer payments. While the amount of government transfers received by senior unattached individuals were very similar – \$11,909 for older women and \$12,672 for older men – such transfers made up 57.3% of the income of older women living alone, compared to 47.6% for unattached senior men. This is linked to historical

gender difference in work patterns; older women have had a lower level of participation in the labour market and thus were less likely to receive their income from private pensions, investments or employment earnings. As a result, they generally had lower market income than men.

**Chart 3.3**  
**Relatively High Government Transfers to Seniors in 1999**

## Chapter 4: Total Income

---

*Total income is the sum of market income and government transfers.*

When all income sources are considered, Canadian economic families received an average of \$63,818 in total income in 1999, an increase of 0.9% from 1998. Average total income for unattached individuals was \$27,058, an increase of 2.9%. Total family income increased 10.8% since 1993, the decade's lowest level.

Six of the ten provinces experienced growth in average total family income. Newfoundland (4.7%), Nova Scotia (3.1%) and New-Brunswick (2.9%) had the largest increases. These provinces also experienced the highest growth in market income.

### **Slight increase in average total income of non-elderly families**

Families whose major income earner was of working age received on average \$66,827 in total income in 1999, a marginal increase (0.6%) compared to 1998. This outcome reflects the more modest performance of their market income as compared to 1998. For these families, 85.6% of total income came from labour market earnings. Unattached individuals of working age had an average total income of \$28,850, up 4.0% from 1998.

### **Total income of older and lone-parent families.**

For families whose main income earner was a senior, average income from all sources was \$45,142 in 1999, up 4.6% from 1998. Among seniors who lived alone, women's income was virtually unchanged in 1999 (\$20,772) compared to their 1998 level. At \$26,609, senior men experienced a drop in their income of 1.4%.

In aggregate terms, market income made up about half of all the income of seniors living on their own, the other half coming from transfers such as public retirement pensions and Old Age Security. Market income accounted for 57.5% of the total income of seniors living in families.

**Chart 4.1**

**Average Total Income of Families and Unattached Individuals, 1990 to 1999**

In 1999, average total income of lone-parent families was \$30,470, almost the same level as in 1998 (\$30,574). Lone mothers received \$27,571, compared to \$27,843 a year earlier. Market income accounted for 74.7% of the total income of lone-parent families and 70.6% of female lone-parent families.

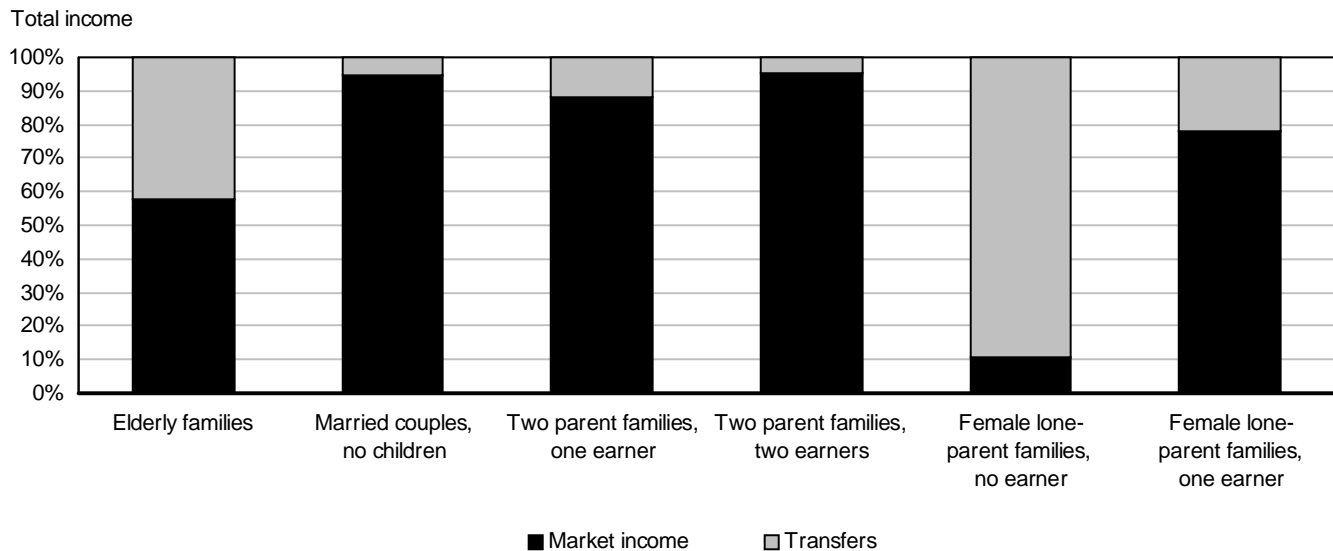

Almost all family types recorded higher total income in 1999 than in 1990. Two-parent families with one earner and those with two earners saw the strongest growth, with increases of 12.1% and 9.6% respectively. In contrast, families headed by a senior in 1999 were just short of the total income level achieved 10 years earlier.

**Income redistribution: impact of government transfers**

In 1999, families in the lowest income quintile received only 3.5% of aggregate market income, but their share of total income was 6.3%. Conversely, families in the highest quintile received 44.4% of aggregate market income but 40.9% of total income. Before government

**Chart 4.2**

**Market Income Made Up Majority of Total Income for Non-elderly Families with Earners in 1999**

transfers, those in the highest income quintile made, on average, \$13 for each \$1 earned by those in the bottom quintile. After transfers, this ratio was reduced to about \$6.5 to \$1.

Government transfers also help reduce the income differences between family types. Before transfers, the average income of non-elderly families was 2.4 times that of elderly families. After transfers, this ratio was reduced to 1.5 times. Similarly, two-parent families had a pre-transfer income 3.5 times that of female lone-parent families. Based on average total income, the difference narrowed to a factor of 2.6.

**Chart 4.3**

**Government Transfers Increased Shares of Total Income for Lower Income Quintiles in 1999**

## Chapter 5: Income Taxes

---

*Income taxes include both federal and provincial taxes. The implicit tax rate shows taxes as a proportion of total income.*

On average in 1999, Canadian families paid \$12,346 in income taxes, down \$362 or 2.8% from 1998 after adjusting for inflation. Income taxes of unattached individuals averaged \$4,994 in 1999, up 4.0% from the previous year.

The average implicit tax rate for Canadian families was 19.3% in 1999, down from 20.1% the previous year. Unattached individuals paid, on average, 18.5% of their total income in taxes, up slightly from 1998 (18.3%).

More specifically, the 1999 implicit tax rate was 19.9% for families in which the major income earner was under age 65. This represents a drop from the previous year (20.6%). The corresponding number in 1999 for unattached individuals under age 65 was 20.2%, a slight increase from 1998 (20.0%).

### **Implicit tax rates by family type**

The Canadian income tax system is based primarily on the individual, and not on the family. Since the majority of taxes are paid on market income, the implicit tax rate and the amount of tax paid is therefore highly related to the market income of each of the family members. Families with little market income generally pay less income tax. For example, in 1999 elderly and female lone-parent families were taxed \$6,297 and \$2,697 on average, yielding implicit tax rates of 13.9% and 9.8% respectively.

Several family types have similar implicit tax rates. In 1999 for example, among families in which the major income earner was under age 65, dual-earner couples without children, dual-earner couples with children and single-earner couples with children all paid, on average, just over one-fifth of their total income in income taxes (21.4%, 21.5% and 21.2%, respectively). These rates correspond to amounts of \$15,292, \$15,922 and \$11,509.

**Chart 5.1**

**Average Income Taxes of Families and Unattached Individuals 1990 to 1999**

**Chart 5.2**

**Shares of Income Tax of Families by Income Quintiles, 1990 and 1999**

**Chart 5.3**

**Average Income Tax by Family Type, 1999**

**Shares of total income tax by income quintile**

In 1999, families in the top quintile paid an average of \$31,966 in income taxes, or just over half (51.8%) of all income taxes paid by Canadian families. In contrast, those in the bottom quintile paid an average of \$1,148 or 1.9% of the total income tax bill of families.

The proportion of tax paid by each income group has shifted in the last ten years. The proportion of taxes paid by families in the bottom quintile has increased but remains relatively low, having gone from 1.6% in 1990 to 1.9% in 1999. Families in the highest quintile also paid a somewhat larger share of taxes in 1999, accounting for 51.8% of aggregate income taxes versus 48.7% in 1990. Conversely, the proportions paid by the second, middle and fourth quintile groups dropped.

## Chapter 6: After-Tax Income

---

*After-tax income is defined as total income (market income plus government transfers) minus income taxes. After-tax income therefore reflects government interventions through taxes and transfers.*

### **After-tax income rises for the fourth year in a row**

After adjustments for inflation, after-tax income rose for the fourth year in a row in 1999. The trends in after-tax income followed those of market income and total income, which rose by 0.9% and 1.4%, respectively, from the previous year. Of the three income concepts, after-tax income was the one that showed the largest increase.

In 1999, the average after-tax income of Canadian economic families was \$51,473, up 1.9% or \$934 from the previous year, after adjusting for inflation. Average after-tax income of unattached individuals was \$22,064 in 1999, up 2.7% from 1998. Overall, families in which the main income earner was under 65 received \$53,507 in after-tax income, or an increase of 1.5%. That of elderly families, however, rose 5.8% or \$2,128, to reach \$38,846. After having risen sharply in 1998, the income of two-parent families with one earner and female lone-parent families changed relatively little in 1999.

### **Growth varies among the provinces**

After-tax income of families rose in all provinces during the 1990s (again, after adjusting for inflation). The overall growth rate for the ten Canadian provinces from 1990 to 1999 was 5.9%, but these rates varied considerably across the country. Only four provinces exceeded the average, led by Ontario and followed in order by Prince Edward Island, Alberta and Saskatchewan. While after-tax income of families in New Brunswick was only slightly below the national average, the remaining five provinces were well below; in each case, the growth rates were under 2%.

Chart 6.1

**Averages in Market Income, Total Income and After-Tax Income Followed Similar Trends**

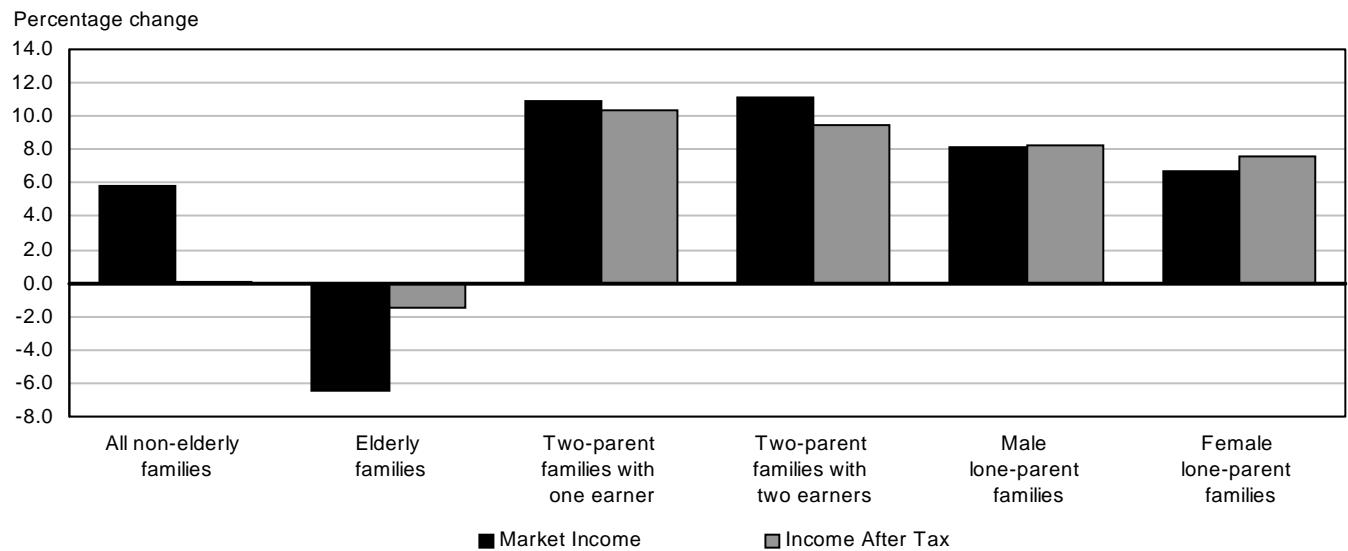

**Government transfers and taxes reduce disparities between the different types of families**

In 1999, the average family received \$6,821 in transfers and paid \$12,346 in taxes, for a net contribution of \$5,525. This amount was equal to 9.7% of their income before transfers and taxes. In other words, families retained on average 90.3% of their market income. Two-parent families with two earners took home 82.4% of their market income in 1999. Female lone-parent families received more in transfers than they paid in taxes; their net gain, on average, was \$5,405 in 1999. For these families, after-tax income exceeded market income by 27.8% in 1999. Similarly, families whose main income earner was a senior received \$19,206 in transfers and paid \$6,297 in taxes in 1999, for a net gain of \$12,909.

The combined effect of personal income taxes and government transfers is to reduce the differences in income among the various types of families. Average market income for two-parent families was over three

Chart 6.2

**Change in Average Market Income and After-Tax Income by Family Type, 1990 and 1999**

times that of female lone-parent families. On an after-tax basis, two-parent families received a little over twice the amount held by female lone-parent families. The after-tax income differences between these two family types have been stable throughout the 1990s.

Similarly, differences in average income between dual-earner and single-earner families with children were reduced by transfers and income taxes. In 1999, before taxes and transfers, the average family with one earner made 67.8% of what a family with two earners did. After taxes and transfers, the proportion rose to 73.8%. Government transfers and taxes also reduce the income difference between elderly and non-elderly families. In 1999, the average market income of elderly families was 41.8% of the non-elderly families. After transfers and taxes, this proportion climbed to 72.6%.

**Chart 6.3**

**Female Lone-parent Families Earned Only a Small Fraction of Average Market Income (29.2%), But a Larger Proportion of Average Income After Tax (43.1%) of Two-parent Families, 1999**

**Chart 6.4**

**Single-earner two-parent families received 73.9% of after-tax income of dual-earner families, 1999**

**Chart 6.5**

**Transfers and Taxes Reduced the Income Difference Between Elderly and Non-elderly Families, 1999**

## Reduced disparity by income quintiles

Before transfers and taxes, the top 20% of Canadian families received \$13 for every \$1 received by those in the bottom quintile. After transfers and taxes, the difference was reduced to \$5 for every \$1.

Chart 6.6

### Lower Income Quintiles Had Larger Shares of Aggregate Income, After Transfers and Taxes in 1999

## Chapter 7: Family Income: Income Inequality

---

*Chapter 7 highlights broad trends in income inequality over a ten-year period, both on a market income basis and an after-tax income basis. The difference between these two concepts of income is government transfers and income taxes, so it also provides a summary of the redistributive impact of the tax-transfer system.*

### **Average income of families at highest level ever**

In 1999, the average real income of Canadian families was at its highest level ever. Both average market income and after-tax income surpassed the previous all-time record levels reached in 1998, by 1.4% and 1.8%, respectively. This puts the decade's lowest year for family income a full six years behind us. However, income inequality also rose sharply in the 1990's, according to various measures. Only in 1999 did income inequality decrease slightly. Unattached individuals saw a second increase in a row in both market (4.3%) and after-tax income (2.7%) after five years with virtually no change.

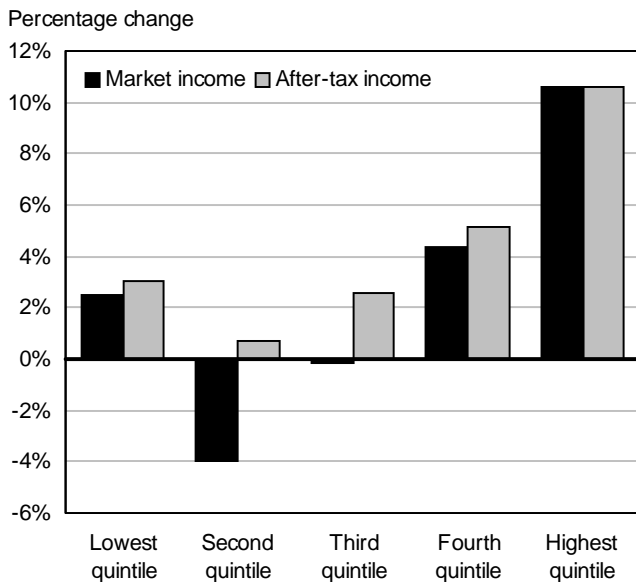

### **A good year for families at the bottom of the distribution**

In terms of either market income or after-tax income, families in the lowest quintile experienced their best year of the decade in 1999. Looking at market income first, this brought the average market income of the 20 percent of families at the bottom end of the income distribution up 29.8 percent above the level of 1993. Average market income of all the other quintiles was up 11 to 15 percent in 1999 as compared to 1993. But of all families, those in the highest quintile still showed the greatest gain over a ten-year period, with 10.6% more market income in 1999 than in 1990, compared with an increase of 2.5% for the lowest quintile. The average market income in 1999 of families in these two quintiles was \$126,451 and \$9,935, respectively. Families in the second quintile, although their market income was about three times as much as that of the first quintile, actually lost ground; they experienced a 4.0% loss, from \$30,159 in 1990 to \$28,949 in 1999.

On the basis of after-tax income, the average income of families in the lowest quintile was 7.5% higher in 1999 than at the lowest level of the decade, also in 1993. The second, third and fourth quintiles had similar increases of 8 to 10 percent over 1993, while average after-tax income of the top quintile increased 14.0%. This shows that inequality of income distribution on an after-tax basis increased since 1993. Nonetheless, the disparities in 1999 were not quite as wide as they were one year before.

When government transfers and taxes are taken into account, the financial situation in all quintiles was at least as good as at the beginning of the decade in real terms. As was the case with market income, gains in average after-tax income of families were least for the second quintile (an increase of 0.7% to \$33,197) and the greatest for the highest quintile (up 10.6% to \$98,657). Average after-tax income of families in the first, third and fourth quintiles increased 3.1%, 2.6% and 5.1%, respectively, between 1990 and 1999.

**Chart 7.1**  
**Average Market Income and Average Total Income of Families by Income Quintile, 1990 and 1999**

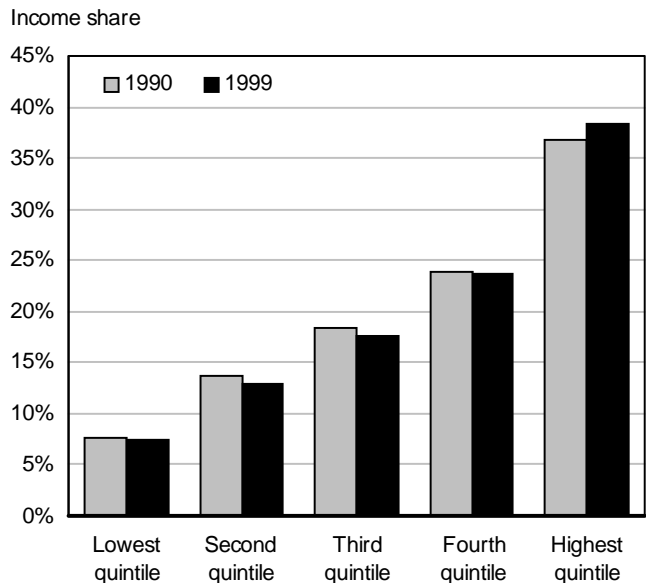

### Income shares indicate a polarization of income

Market income for Canadian economic families has become more polarized in the 1990s. In 1990, the top 20% of families received 42.2% of aggregate market income. Their share was 44.4% in 1999. Market income shares of the other four quintiles dropped slightly over the past decade to account for this gain. The biggest losses were by the second and third quintiles, which each experienced drops of almost one percentage point in their respective shares of market income.

Transfers and taxes continued to lessen the disparities in income, but at the end of the decade after-tax income inequality was higher than at the beginning of the decade. Families in the upper quintile received 36.7% of after-tax income in 1990 and 38.3% in 1999. Families in the lowest quintile saw their share drop from 7.6% of aggregate after-tax income in 1990 to 7.4% in 1999. Both these differences as seen in 1999 were somewhat reduced from what they were in 1998.

**Chart 7.2**  
**Shares of After-tax Income for families by Income Quintiles, 1990 and 1999**

### Increasing ratio of the top to the bottom during the 1990s

Another useful measure of income inequality is the ratio of average income of the highest income families to the lowest. During the recession years at the beginning of the decade, inequality in market income rose considerably. While the highest quintile received 11.8 times more in market income than the lowest quintile in 1990, this ratio increased to 13.9 to 1 in 1994. The net effect of taxes and transfers over this period was to counterbalance this trend such that the ratio of after-tax income between the top and bottom quintiles remained stable at 4.8 to 1.

By 1999, the gap in market income between the top and the bottom quintiles had dropped back down to 12.7. Meanwhile, the ratio for after-tax income widened over the latter part of the decade to 5.4 in 1998 and fell again to 5.2 in 1999.

### Gini coefficients also indicate increasing income inequality

The Gini coefficient is a summary measure of income inequality that takes into account the income of every unit of the population. A Gini coefficient of zero indicates perfect equality where income is equally distributed across the population. A value of 1 indicates complete inequality where one unit in the population has all the income.

**Chart 7.3**

**Income Inequality Increased in the Second Half of the 1990s**

Average income ratio:  
Highest to lowest quintile

The Gini coefficients of market income, total income and after-tax income all show an upward trend in income inequality through the 1990s. In 1999, the Gini coefficient of market income for Canadian families was significantly higher than a decade ago, at 0.428 versus 0.402. The corresponding Gini coefficients of total and after-tax income, while lower, also indicate increased inequality, especially during the latter half of the 1990s.

Married couples with no children at home and two-parent families saw an increase in income inequality. For example, on an after-tax basis, the Gini coefficient for married couples was 0.299 in 1999, up from 0.279 a decade ago. Two-parent families had a Gini value of 0.271 in 1999, compared to 0.247 in 1990. After-tax income distribution among senior families, however, has become more equal. Their after-tax income Gini coefficients declined from 0.275 to 0.269 in 1999.

## Chapter 8: Low Income

---

*A person in low income is someone whose family income falls below Statistics Canada's low income cutoffs (LICOs). The cutoffs reflect an income level at which a family is likely to spend significantly more of its income on food, shelter and clothing than the average family.*

*Low income cutoffs have been calculated using both total income (that is, income after transfers but before taxes) and after-tax income. Although both sets of cutoffs and rates have been available for many years, the after-tax rates were not highlighted because they were published several months later than those based on total income. Starting with reference year 1998, the two sets are available simultaneously.*

*The analysis below is based on after-tax low income information. After broad-based consultation, it was the view that this measure was preferable for two main reasons. First, income taxes and transfers are essentially two methods of income redistribution. The before-tax rates only partly reflect the redistributive impact of Canada's tax/transfer system, by including the effect of transfers but not the effect of income taxes. Second, since the purchase of necessities is made with after-tax dollars, it is logical to use people's after-tax income to draw conclusions about their overall economic well-being.*

*However, some data users prefer to use low income rates and levels based on total income, and Statistics Canada continues to publish this information, in the electronic version of this publication. For more information, see "Notes and Definitions".*

When is someone counted as being in low income? Low income cutoffs depend on family size since larger families need more income. The cutoffs also take into account the varying costs by community size. In 1999, a family of four living in a city of half a million or more would be counted as low income if its after-tax income fell below \$28,392. For the same family living in a rural area, the cutoff was \$18,615.

### **Fewer families in low income in 1999**

An estimated 723,000 families were in low income in 1999, down from 737,000 in 1998. The low income rate also declined, from 8.9% in 1998 to 8.6% in 1999, the lowest rate for economic families since 1990 (8.5%).

The situation of families below the low income cutoff in 1999 showed some improvement. Families in low income would have needed, on average, an additional \$6,262 in after-tax dollars to reach the low income cutoff. In relative terms, the gap was 29.6%. In 1998, the income gap for low income families averaged \$6,690 or 31.6%.

Among unattached individuals, 1,280,000 or 29.9% were in low income in 1999, virtually the same as in 1998. Unattached individuals in low income would have needed, on average, an extra \$5,047 to reach the low income cutoff in 1999. In relative terms, their low income "gap" was 37.1%, slightly worse than the 36.7% gap in 1998.

### Low income varies, depending on family type and number of earners

The low income rate for non-elderly families was 9.6% in 1999, virtually unchanged from 9.7% the previous year. However, the average rate conceals large differences by family type and number of earners in the family. Only 6.1% of non-elderly married couples with no children at home were in low income in 1999. Their low income rate rose to 31.8% if both partners were non-earners in 1999, and dropped to 1.9% if both received earnings. For the 3,111,000 two-parent families with children, the average low income rate was 7.3%. A clear majority of these two-parent families (1,932,000) had two earners in 1999; the low income rate for this group was 3.7%, unchanged from 1998. Of the estimated 517,000 two-parent families with one earner, 19.1% were in low income, compared with 18.5% the previous year.

Although relatively few in number, 77.4% of the 63,000 families with no earners experienced low income in 1999.

### Low income rate for lone-parent families remains high

The low income rate for lone-parent families remained virtually unchanged in 1999, at 36.9%. Of the 570,000 lone-parent families headed by women, 41.3% were in low income in 1999, up from 40.4% in 1998. Three out of every four lone-parent families headed by women had earnings in 1999. While the low income rate of female lone-parent families with earnings was three times the average for all families (25.5% versus 8.6%), they fared much better than lone mothers without earnings; 90.9% of the latter experienced low income in 1999.

### Low income rate for persons also drops

In 1999, 11.8% of all Canadians were living in low income families (about 3.6 million persons), down 0.3 percentage points from 1998. After climbing throughout the early 1990s, the prevalence of low income peaked in 1996, at 14.0%, and has declined over the last three years. Low income is more prevalent among women than men, 12.6% versus 10.9% in 1999.

About 962,000 children under 18 were in low income families in 1999, down from 978,000 in 1998. The proportion of children living in low income families has been falling since 1996, when it peaked at 16.8% on an after-tax income basis. The rate then fell to 13.9% in 1998 and 13.7% in 1999.

Chart 8.1

### Majority of Families with No Earner in 1999 were in low income

Among seniors aged 65 and over, low income rates and trends vary by gender. For senior women, the 1990s have generally been a decade of moderate declines in low income. The rate in 1999 was 11.1%, unchanged from 1998 and down from 13.9% in 1990. Among senior men, rates were lower. In 1999, 4.4% of men aged 65 and over were in low income. However, seniors living on their own, as unattached individuals, did not fare as well as those living in families: 21.7% were in low income in 1999, compared with only 1.8% of seniors living in an economic family. The rate was 23.6% for unattached older women, 16.6% for men.

People in the 18 to 64 age range account for about half of the low income population. Their low income picture mirrors the average for the population at large. Thus, 11.8% of this age group was in low income in 1999.

**Chart 8.2**  
**Low Income Rate of Children Dropped in 1998 but Still Higher than Other Age Groups**

## Crossing the line

A family's income often changes substantially over time. A breadwinner may lose a job, a second family member may enter the labour market. The family itself may experience a change, such as marital separation, which affects income. The birth of a child, an older relative joining the household or even a move to a larger city can affect income needs. Such changes can cause a family to "cross the line", moving into or out of low income.

Of all persons in low income in 1998, one-third were no longer below the line in 1999, while the remaining two-thirds stayed in low income both years. Despite the reduction in the overall low income rates in 1999, many people dropped below the low income cutoff that year. Specifically, of all people in low income in 1999, 30% had not been in low income the year before. In short, there is clearly some turnover in the low income population from one year to the next. At least for some, low income is not a persistent state. However, this level of turnover also means that, over a longer period, the number of people experiencing low income is much greater than one might conclude based on annual low income rates.

## Low income touches more than one in five people over a six-year period

A quarter of all Canadians (24.1%) experienced low income at some time between 1993 and 1998. This reflects the fact that, for some, low income is a transitory experience. About 8.0% experienced one year of low income and 4.8% experienced two years (not necessarily consecutive). At the other extreme, 3.3% of the population were in low income throughout the full six years. Among all those below the cutoff at some time during the six-year period, the average spent just under three years in low income.

Among children under age 18, 29.0% were in families that experienced low income at some time over the 1993-1998 period. About 9.4% were in low income for one year, 3.5% for all six years. At 2.8, the average number of years in low income for children was about the same as the average for all persons.

<sup>1</sup> Respondents who replied "don't know" to the questions on educational attainment are excluded from the breakdown by education level but included in the totals by age and sex.

<sup>2</sup> The years that the person was in low income over the six-year period were not necessarily consecutive, unless it was all six years.

## Chapter 9: Background Tables

---

This chapter shows the population estimates underlying the income time series covered in the publication. Table 9.1 provides data on the number of persons for the selected family types. Table 9.2 presents data on the number of families by selected family types.

Table 9.1

## Notes and Definitions

---

### Income Definitions

This section reviews the definitions of the main income concepts and their components. In order to highlight the relationships between them, this section is organized according to the “Classification of Income Sources”, shown as a table under *Total income*, below.

### Total income

Total income refers to income from all of the sources including government transfers and before deduction of federal and provincial income taxes. It may also be called income before tax (but after transfers). All sources of income are identified as belonging to either market income or government transfers.

### Table A

#### Classification of Income Sources

Total income
Market income
Earnings
Wages and salaries
Self-employment income
Farm
Non-farm
Investment income
Retirement pensions
Other income
Government transfers
Old Age Security and Guaranteed Income Supplement/Spouse's Allowance
Canada Pension Plan/Quebec Pension Plan benefits
Child tax benefits
Employment Insurance benefits
Workers' compensation benefits
GST/HST Credit
Provincial/territorial tax credits
Social assistance
Other government transfers

While a justification of the definition of income is not attempted here, some important inclusions and exclusions are noted.

- The concept of income covers income received while a resident of Canada or as relevant for income tax purposes in Canada. This excludes some, but not all, foreign income.

- Retirement income received as a regular pension or annuity during retirement is included, while cash withdrawals from private pension plans, including Registered Retirement Savings Plans (RRSPs), prior to retirement, are excluded.
- Realized capital gains from financial investments are excluded. However, inasmuch as they provide a retirement income as defined above, they may be partially accounted for. The Canadian System of National Accounts (CSNA), which focuses on current production and the incomes arising from it, excludes both retirement pensions and realized capital gains.
- In the CSNA and the present classification, taxes on capital gains are included in income taxes, as are taxes on RRSP withdrawals. Both capital gains (the taxable portion thereof) and RRSP withdrawals figure in the calculation of taxes, but are not part of total income in the CSNA or in this classification.
- This classification includes all refundable tax credits and benefits, including those that are not part of total income for income tax purposes, such as child tax benefits, the Goods and Services Tax Credit/Harmonized Sales Tax Credit, and other provincial or territorial tax credits. There are other, smaller differences between total income here and that defined for tax purposes (see “Other income” and “Other government transfers”).
- Contributions to Employment Insurance and the Canada and Quebec Pension Plans, both federal programs, are not included in income taxes, nor are they deducted from income to arrive at after-tax income. However, the Canadian System of National Accounts recently revised its definition of taxes on production to include these payroll taxes, in accordance with international recommendations on national accounting. SLID will publish data on these items at a later date.

### **Market income**

Market income is the sum of earnings (from employment and self-employment), investment income, (private) retirement income, and the items under “other income”. It is equivalent to total income minus government transfers. It is also called income before taxes and transfers.

### **Earnings**

This includes earnings from both paid employment (wages and salaries) and self-employment.

### **Wages and salaries**

These are gross earnings from all jobs held as an employee, before payroll deductions such as income taxes, employment insurance contributions or pension

plan contributions, etc. Wages and salaries include the earnings of owners of incorporated businesses, although some amounts may instead be reported as investment income. Commission income received by salespersons as well as occasional earnings for baby-sitting, for delivering papers, for cleaning, etc. are included. Overtime pay is included.

For historical reasons, data previously published from the SCF up to reference year 1997 were always adjusted to exclude the income of individuals and families whose major source of income was military pay and allowances, if they were not living in barracks. Military personnel living in barracks were not part of the target population to begin with, nor are they now, in SLID. The SCF data have now been readjusted back in time to include military income of those not living in barracks, making the data consistent with the target population for all years, in either survey. (Certain specified tables on the SCF CD-ROM products or 1996 and 1997 were already produced on this basis, but were not widely used.)

### **Self-employment income**

This is net self-employment income, i.e., after deduction of expenses. Negative amounts (losses) are accepted. It includes income received from self-employment on own account, in partnership in an unincorporated business, or in independent professional practice. Income from roomers and boarders (excluding that received from relatives) is included. Note that because of the various inclusions, receipt of self-employment income does not necessarily mean the person held a job.

Self-employment income is sub-divided into farm self-employment income and non-farm self-employment income. Farm self-employment income is reported by individuals who operate their own or a rented farm, either on own account or in partnership. Included are money receipts from the sale of farm products as well as related supplementary and assistance payments from governments. Income in kind is excluded.

### **Investment income**

This includes interest received on bonds, deposits and savings certificates from Canadian or foreign sources, dividends received from Canadian and foreign corporate stocks, cash dividends received from insurance policies, net rental income from real estate and farms, interest received on loans and mortgages, regular income from an estate or trust fund and other investment income. Realized capital gains from the sale of assets are excluded. Negative amounts are accepted.

### **Retirement pensions**

This is retirement pensions from all private sources, primarily employer pension plans. Amounts may be received in various forms such as annuities, super-

annuation or RRIFs (Registered Retirement Income Funds). Withdrawals from RRSPs (Registered Retirement Savings Plans) are not included in retirement pensions. However, they are taken into account as necessary for the estimation of certain government transfers and taxes. For data obtained from administrative records, income withdrawn from RRSPs before the age of 65 is treated as RRSP withdrawals, and income withdrawn from RRSPs at ages 65 or older is treated as retirement pensions. Retirement pensions may also be called pension income.

### **Government transfers**

Government transfers include all direct payments from federal, provincial and municipal governments to individuals or families. See the table "Classification of income sources" for a list of the government transfers identified separately in the latest reference year. It should be noted that many features of the tax system also carry out social policy functions but are not government transfers per se. The tax system uses deductions and non-refundable tax credits, for example, to reduce the amount of tax payable, without providing a direct income.

### **Child tax benefits**

Federal child tax benefits began in 1993 and replaced both the federal Family Allowances and the Child Tax Credit. Several provincial and territorial programs have since been introduced, in addition to Quebec family allowances which already existed before 1993. To be eligible, a person must have the primary responsibility for the care and upbringing of one or more children under the age of 18. Most benefits are calculated by setting a maximum amount per family or per child and reducing that total by a certain percentage of the family's net income. The programs which were explicitly accounted for in the data for 1999 were: the federal basic benefit and National Child Benefit Supplement (together called the Canada Child Tax Benefit), the Newfoundland and Labrador Child Benefit, the Nova Scotia Child Benefit, the New Brunswick Child Tax Benefit, the New Brunswick Earned Income Supplement, the Quebec *Allocation familiale*, the Quebec *Allocation à la naissance*, the Ontario Child Care Supplement for Working Families, the Saskatchewan Child Benefit, the Alberta Family Employment Tax Credit, the BC Family Bonus, and the BC Earned Income Benefit.

### **Old Age Security (OAS), Guaranteed Income Supplement (GIS) and Spouse's Allowance**

The Old Age Security (OAS) pension is targeted to Canadian residents aged 65 and over. OAS recipients who have little or no other income may also receive the federal Guaranteed Income Supplement (GIS); and their spouses, if aged 60 to 64 (and not yet eligible for OAS and GIS themselves), receive the Spouse's Allowance.

### **Canada Pension Plan (CPP) and Quebec Pension Plan (QPP) benefits**

The CPP and QPP are compulsory contributory social insurance programs that provide a source of retirement income and protect workers and their families against loss of income due to disability or death.

### **Employment Insurance benefits**

Employment Insurance is a federal program which includes the following types of benefits: regular unemployment benefits, sickness benefits, maternity and parental benefits, and benefits for persons taking approved training courses or participating in job creation or job-sharing projects. To qualify, the claimant must have ceased receiving employment income and have worked a minimum number of weeks or hours of insurable employment over the preceding period.

### **Social assistance**

Social assistance covers many provincial and municipal income supplements to individuals and families. It is usually provided only after all other possible sources of support have been exhausted.

### **Workers' compensation benefits**

Workers' compensation is provided to protect all full-time and part-time employees from loss of salary due to work accidents or occupational diseases and help them to pay their medical expenses and other costs.

### **Goods and Services Tax/Harmonized Sales Tax Credit**

This credit was introduced in conjunction with the Goods and Services Tax in 1990. It is intended to offset the GST/HST for lower-income families and individuals. In Nova Scotia, New Brunswick and Newfoundland, its name was changed to the Harmonized Sales Tax Credit in April 1997 when the administration of the tax was combined with provincial sales tax.

### **Provincial/territorial tax credits**

Included here are refundable tax credits other than those for children (included with child tax benefits). Some are designed to help low-income individuals and families to pay property taxes, education taxes, rent and living expenses, and so on. Provincial sales tax credits such as the Quebec Sales Tax Credit and the Newfoundland HST Credit are included. The Quebec abatement, although refundable, is not included here but rather with income taxes.

### **Other government transfers**

This includes government transfers not included elsewhere, mainly any other non-taxable transfers. In SLID, these amounts are included with "Other income". This

is partly because the coverage of any transfers not taxed through the income tax system is low. In the interviews of both SCF and SLID, there may be under-reporting of these transfers, which are mainly collected using an open question. Nonetheless, the types of transfers which have come under this heading include: training program payments not reported elsewhere, the Veteran's pension, pensions to the blind and the disabled, regular payments from provincial automobile insurance plans (excluding lump-sum payments), and benefits for fishing industry employees.

### **Other income**

This sub-total includes all items of market income not included elsewhere. Among them are support payments received (also called alimony and child support). The coverage of other items depends at least to some extent on the method of income data collection, whether from administrative income tax records or by interview. Those items which are included on line 130 of the T1 tax return are well covered. These include, but are not restricted to, retiring allowances (severance pay/termination benefits), scholarships, lump-sum payments from pensions and deferred profit-sharing plans received when leaving a plan, the taxable amount of death benefits other than those from CPP or QPP, and supplementary unemployment benefits not included in wages and salaries.

### **Income tax**

Income tax is the sum of federal and provincial income taxes payable (accrued) for the taxation year. Income taxes include taxes on income, capital gains and RRSP withdrawals, after taking into account exemptions, deductions, non-refundable tax credits, and the refundable Quebec abatement. In the Survey of Labour and Income Dynamics, the data are either taken directly from administrative records or estimated based on aggregate data from administrative records, as this yields better results than the amounts reported by interview.

### **After-tax income**

After-tax income is total income, which includes government transfers as defined here, less income tax. It may also be called income after tax.

## **Family Definitions**

### **Dwelling**

In general terms a dwelling is defined as a set of living quarters. A private dwelling is a separate set of living quarters with a private access. A collective dwelling may be institutional, communal or commercial in nature. Of the different types of collective dwellings, only communal dwellings are covered in the SLID and the SCF.

## **Household**

A household is defined as a person or group of persons residing in a dwelling.

### **Adults**

Adults are defined in SLID as 16 or older as of December 31<sup>st</sup> of the reference year, and in SCF they are defined as 15 or older at the time the person entered the Labour Force Survey sample, which is approximately 6 months prior to the interview in April. The impact of this conceptual difference is considered to be negligible.

Economic families, unattached individuals, and all units  
An economic family is defined as a group of two or more persons who live in the same dwelling and are related to each other by blood, marriage, common-law or adoption. An unattached individual is a person living either alone or with others to whom he or she is unrelated, such as roommates or a lodger. The total of economic families and unattached individuals may be referred to as either "all units" or economic families composed of one or more persons.

### **Census families and persons not in census families**

The term "census family" corresponds to what is commonly referred to as a "nuclear family" or "immediate family". In general, it consists of a married couple or common-law couple with or without children, or a lone-parent with a child or children; furthermore, each child does not have his or her own spouse or child living in the household.

SLID uses a slightly different definition of census families from that used by the SCF. In this definition, the restriction that a "child" of a parent in a census family must be under the age of 25 has been added. There must now also be a parent-child relationship (guardian relationships such as aunt or uncle are not sufficient). The previous restriction that the child must never have been legally married has been dropped. Data drawn from the SCF still use the earlier definition.

Persons "not in census families" are those living alone, living with unrelated individuals, or living with relatives but not in a husband-wife or parent-unmarried child (including guardianship child) relationship.

By definition, all persons who are members of a census family are also members of the same economic family.

### **Family income**

Family income is the sum of income of each adult in the family as defined above. Household income is likewise the sum of incomes of all adults in the household. Family and household membership is defined at a particular

point in time, while income is based on the entire calendar year. The family members or “composition” may have changed during the reference year, but no adjustment is made to family income to reflect this.

SLID defines households and families according to the living arrangements on December 31 of the reference year, while SCF defined them at the time of the survey, which was the following April. Residents of Canada are also defined at those points in time. This timing difference is not believed to have a major impact.

The manner in which relationship or membership information is collected differs between the two surveys, but both approaches should yield the same results. The SCF information was taken from the Labour Force Survey and was the relationship of each person to a specific individual, called the reference person. SLID collects the relationship between every pair of individuals in a household.

### Head of family

SCF has a concept of “head of family” which does not exist in SLID (see “Major income earner”). Unlike the concept of major income earner which SLID uses, it is based on relationships, rather than who receives income and of what type or how much. The following rules determine the head of family. If the economic family consists of only one census family, then only the first two rules are necessary. All references to married relationships include legally married and common-law relationships.

- In families consisting of a married couple (with or without children or other relatives), the man is the “head”.
- In lone-parent families with unmarried children, the parent is the “head”.
- In lone-parent families with married children, the member who is mainly responsible for the maintenance of the family, as identified in a survey question, is the “head”.
- In families where relationships are other than husband-wife or parent-child, normally the eldest in the family is considered the head.

### Major income earner

This characteristic is important for the derivation of detailed family types (see “Family classification”). The SCF used the concept of “head of family”. For each household and family, the major income earner is the person with the highest income before tax, with one exception: a child living in the same census family as his/her parent(s) cannot be identified as the major

income earner of the census family (this does not apply to economic families).

For persons with negative total income before tax, the absolute value of their income is used, to reflect the fact that negative incomes generally arise from losses “earned” in the market-place and are not meant to be sustained. In the rare situations where two persons have exactly the same income, the older person is the major income earner.

### Family classification

SLID has adopted the basic classification used in SCF, although other family types can be derived using the SLID internal files. SLID uses the major income earner as opposed to head of family, where these concepts are relevant (see the notes following the classification), but this is believed to have a minimal impact.

**Table B**

### Classification of family types

Economic families (or Census families), 2 persons or more
Elderly families
Married couples
Other elderly families
Non-elderly families
Married couples without children
No earner
One earner
Two earners
Two-parent families with children
No earner
One earner
Two earners
Three or more earners
Married couples with other relatives
Lone-parent families
Male lone-parent families
Female lone-parent families
No earner
One earner
Two or more earners
Other non-elderly families
Unattached individuals (or Persons not in census families)
Elderly male
Non-earner
Earner
Elderly female
Non-earner
Earner
Non-elderly male
Non-earner
Earner
Non-elderly female
Non-earner
Earner

Within this classification, the following definitions apply. Note that wherever the term “major income earner” is used, the term “head of family” should be substituted in the case of SCF data.

**Elderly family:** The major income earner is aged 65 or over.

**Non-elderly family:** The major income earner is under age 65.

**Married couples/Spouses:** Married couples, including legally married, common-law and same-sex relationships, where one of the spouses is the major income earner.

**Children:** A child or children (by birth, adopted, step, or foster) of the major income earner under age 18. Other relatives may also be in the family.

**Lone-parent family:** Includes at least one child as defined above. Families where the parent is 65 years or older are excluded.

**Relative:** A person related to the major income earner by blood, marriage, adoption or common-law.

**Other relative:** A person in the economic family who is not the major income earner nor his/her spouse or child under age 18.

## Analytical Concepts

### Current dollars versus constant dollars

“Current dollars” are what we usually mean when we refer to a currency in the current time period. The term “constant dollars” refers to dollars of several years expressed in terms of their value (“purchasing power”) in a single year, called the base year. This type of adjustment is done to eliminate the impact of widespread price changes. Current dollars are converted to constant dollars using an index of price movements. The most widely used index for household or family incomes, provided that no specific uses of the income are identified, is the Consumer Price Index (CPI), which reflects average spending patterns by consumers in Canada.

The following table shows the annual rates of the Consumer Price Index. To convert current dollars of any year to constant dollars, divide them by the index of that year and multiply them by the index of the base year you have chosen (remember that the numerator contains the index value of the year you want to move to). For example, using this index, \$10,000 in 1997 would be \$10,092 in 1998 constant dollars ( $\$10,000 \times 108.6/107.6 = \$10,092$ ).

**Table C**

### Consumer Price Index, annual rates, 1992=100

1980	52.4	1991	99.5
1981	58.9	1992	100.0
1982	65.3	1993	101.8
1983	69.1	1994	102.0
1984	72.1	1995	104.2
1985	75.0	1996	105.9
1986	78.1	1997	107.6
1987	81.5	1998	108.6
1988	84.8	1999	110.5
1989	89.0	2000	113.5
1990	93.5		

### Earners/Income recipient

An earner is a person who received income from employment (wages and salaries) and/or self-employment during the reference year. The term income recipient is generally used for someone who received a positive (or negative) amount of income of any given type.

### Mean Income (Average Income)

The mean or average income is computed as the total or “aggregate” income divided by the number of units in the population. It offers a convenient way of tracking aggregate income while adjusting for changes in the size of the population.

There are two drawbacks to using average income for analysis. First, since everyone’s income is counted, the mean is sensitive to extreme values: unusually high income values will have a large impact on the estimate of the mean income, while unusually low ones, i.e. highly negative values, will drive it down. (See also “Recipients versus non-recipients” and “Negative values”.) Secondly, it does not give any insight into the allocation of income across members of the population. For this, measures such as quintiles, deciles, or Gini coefficients may be used.

### Recipients versus non-recipients (Zero values)

For every table showing average incomes, it must be kept in mind whether non-recipients of that type of income are included or excluded from the population. In the case of total family income, the difference of including or excluding units with zero income is small since there are very few such families. However, if one is interested in the average amount of individual self-employment earnings, the value will be quite different if one includes those persons who were not self-employed. Zero values are included in all tables focusing on the three main income concepts (market, total and after-tax income), government transfers or taxes. Zero values are excluded in table 4.2.

## Negative values

Negative income amounts can arise in two ways: net losses from self-employment (expenses exceed receipts), or net investment losses (losses exceed gains). As with zero values, negative values can have a large impact on results. In general, the published income tables treat negative values no differently than positive values, but there are a few exceptions: for the calculation of both Gini coefficients and the low income gap, negative values are converted to zeroes; and in the derivation of the major income earner of a family or household, the absolute value is used instead (see “Major income earner” under “Family definitions”).

## Quintiles and Deciles

Income quintiles are a convenient way of categorizing units of a given population from lowest income to highest income for the purposes of drawing conclusions about the relative situation of people at either end or in the middle of the scale. Rather than using fixed income ranges, as in a typical distribution of income, it is the size of each population group that is fixed.

First, all the units of the population, whether individuals or families, are ranked from lowest to highest by the value of their income of a specified type, such as after-tax income. Then the ranked population is divided into five groups of equal numbers of units, called quintiles. Analogously, dividing the population ranked by income into ten groups, each comprising the same number of units, produces deciles.

Most analyses should be carried out on the people of different quintiles within a distribution. Care should be taken in making comparisons between quintiles that resulted from different distributions, because any difference in either the population or the income concept used to rank units could have a large effect. It is probable that both the income ranges represented by each quintile and the people making up each quintile will be different.

## Median Income

The median income is the value for which half of the units in the population have lower incomes and half have higher incomes. To derive the median value of income, units are ranked from lowest to highest according to their income and then separated into two equal-sized groups. The value that separates these groups is the median income. It corresponds to the 50th percentile.

Because the median corresponds exactly to the midpoint of the income distribution, it is not, contrary to the mean, affected by extreme income values. This is a useful feature of the median, as it allows one to abstract from unusually high values held by relatively few people.

Since income distributions are typically skewed to the left – that is, concentrated at the low end of the scale – median income is usually lower than mean income.

## Implicit rate of government transfers or taxes

The implicit rate of either transfers or taxes, as the case may be, is a way of showing the relative importance of transfers received or taxes paid for different families or individuals. This concept is similar, but not identical, to the effective rate of taxation. For a given individual or family, the effective rate is the amount of transfers/taxes expressed as a percentage of their income, usually market income, total income, or after-tax income. The implicit rate for a given population is the average (or aggregate) amount of transfers/taxes expressed as a percentage of their average (or aggregate) income.

## Family size adjustment (Equivalence scale)

When comparing family incomes to study such things as income adequacy or socio-economic status, one often wants to take the family size into account. Basically stated, the income amount itself is not sufficient to understand a family's financial well-being without knowing how many people are sharing it. Two approaches have been used to help with the analysis of family income. One is to produce data by detailed family types, so that within a given family type, differences in family size are not significant. In fact, many income measures have been crossed by detailed family types in the published tables.

The other way to take into account family size is to adjust the income amount, for the purposes of analysis only. The major challenge of this approach is to select an appropriate adjustment factor. It can be argued, however, that some adjustment is better than none.

The simplest method is to use per capita income, that is, to divide the family income by the family size. A limitation of per capita income, however, is that it tends to underestimate economic well-being for larger families as compared to smaller families. This is due to the fact that it assumes equal living costs for each member of the family, but some costs, primarily those related to shelter, decrease proportionately with family size (they may also be lower for children than for adults). For example, the shelter costs for an adult married couple with no children are arguably not much more than those for an adult living alone. To take such economies of scale into account, it is common to use an “equivalence scale” to adjust family incomes. Instead of implicitly assuming equal costs for additional family members as the per capita approach does, the equivalence scale is a set of decreasing factors assigned to the first member, the second member, and so on. The adjusted income amount for the family is derived by dividing the income value by the sum of the factors assigned to each member.

There is no single equivalence scale in use in Canada. The one used in the published income tables and in concepts such as the Low Income Measure (LIM) has, however, achieved a high degree of acceptance. In this equivalence scale, the factors are as follows:

- the oldest person in the family receives a factor of 1.0;
- the second oldest person in the family receives a factor of 0.4;
- all other family members aged 16 and over each receive a factor of 0.4;
- all other family members under age 16 receive a factor of 0.3.

For example, this translates into a total factor for dividing income of just 1.4 for a married couple instead of 2.0 (the family size). Such a family with total income of \$56,000 would be considered to have a standard of living equivalent to an adult living alone with a total income of \$40,000, as compared to an adult with \$28,000 when calculated on a per capita basis.

### **Gini coefficient**

The Gini coefficient, as applied to incomes, measures the degree of inequality in an income distribution. Gini coefficients are published for a variety of income measures such as market income, total income and after-tax income, and are used to compare the uniformity of income allocation between different income measures across different populations or within the same population over time.

Values of the Gini coefficient can range from 0 to 1. A value of zero indicates income is equally divided among the population with all units receiving exactly the same amount of income. At the opposite extreme, a Gini coefficient of 1 denotes a perfectly unequal distribution where one unit possesses all of the income in the economy. A decrease in the value of the Gini coefficient can, by and large, be interpreted as reflecting a decrease in inequality, and vice versa. As a rough rule of thumb when using data from SLID or SCF, a difference of 0.01 or more between two Gini coefficients is considered statistically significant.

## **Low Income Definitions**

### **Low income cutoff (LICO)**

Low income cutoffs (LICOs) are established using data from the Family Expenditure Survey, now known as the Survey of Household Spending. They convey the income level at which a family may be in straitened circumstances because it has to spend a greater proportion of its income on necessities than the average family of

similar size. Specifically, the threshold is defined as the income below which a family is likely to spend 20 percentage points more of its income on food, shelter and clothing than the average family. There are separate cutoffs for seven sizes of family – from unattached individuals to families of seven or more persons – and for five community sizes – from rural areas to urban areas with a population of more than 500,000.

### **Calculation of low income cutoffs**

The first step in the production of a set of low income cutoffs is to calculate the average proportion of income that a family spends on food, shelter and clothing. The 1992 Family Expenditure Survey found that, on average, families spend 44% of their after-tax income (and 35% of their total “before-tax” income) on these necessities. Then, 20 percentage points are added, giving 64% of after-tax income. This is done on the grounds that a family spending more than this proportion of its income on necessities is significantly worse off than the average. The final step is to look at the distribution of income by expenditure and determine, using a regression line, the level of income at which a family tends to spend 20 percentage points more than the average on the necessities of food, shelter and clothing.

### **Updating and rebasing the low income cutoffs**

There are two reference years that play a part in the calculation of a set of low income cutoffs: the base year and the income reference year. The base year supplies the average spent on food, shelter and clothing. This percentage is used to derive a set of cutoffs that are suitable for use with income data from that year. Cutoffs for other income reference years may be obtained by applying the corresponding Consumer Price Index (CPI) inflation rate to the basic set of cutoffs.

Using the CPI to update the cutoffs takes inflation into account, but does not reflect any changes that might occur in the average spending on necessities. In the past, Statistics Canada has developed a new set of cutoffs after each Family Expenditure Survey. These are referred to as “bases” because the average spending on necessities in that base year drives the calculation of the cutoffs. The two most recent base years are 1992 and 1986. Cutoffs based on 1992 are most commonly used, and are available for the income reference years from 1980 onwards.

### **Low income rate**

Low income rates can be calculated for persons or for families. In either case, the income that is compared to the cutoff is the income of the entire economic family. “Persons in low income” should be interpreted as persons who are part of low income families including persons living alone whose income is below the cutoff. Similarly, “children in low income” means “children who

are living in low income families”. In other words, all members of an economic family have the same low income status, but they are counted separately when person-based low income rates are calculated.

To calculate the low income rates, the family size and community size are used to find the appropriate cutoff. Then the family income is compared to that cutoff. If a family low income rate is being calculated, then the family is counted as being in low income if its income is less than the cutoff. If a person low income rate is being calculated, then all persons in the family are counted as being in low income if the family income is less than the cutoff.

### **Use of after-tax and before-tax LICOs**

The average portion of income that families spend on food, shelter and clothing, which figures prominently in the low income cutoffs, is undoubtedly a useful gauge of economic well-being no matter which income concept is used. The choice of after-tax income or total income – or even market income for that matter – depends on whether one wants to take into account the added spending power that a family gets from receiving government transfers and its reduced spending power from paying taxes.

In the past, Statistics Canada has produced two sets of low income cutoffs and corresponding rates – those based on total income (i.e. income including government transfers, before the deduction of income taxes) and those based on after-tax income. The total income rates, called “before-tax rates”, were better known, for the main reason that the survey production cycle made them available earlier than the after-tax rates.

Starting with the publication of data for 1998, the two sets of rates are available simultaneously. The after-tax rates are featured in the analytical portion of this publication. This choice to highlight after-tax rates was made for two main reasons.

First, income taxes and transfers are essentially two methods of income redistribution. The before-tax rates only partly reflect the entire redistributive impact of Canada’s tax/transfer system, by including the effect of transfers but not the effect of income taxes. Second, since the purchase of necessities is made with after-tax dollars, it is logical to use people’s after-tax income to draw conclusions about their overall economic well-being.

A note about the calculation of before-tax versus after-tax low income cutoffs: the derivation of each set of cutoffs is done independently. There is no simple relationship, such as the average amount of taxes payable, that distinguishes the two levels. Instead, the

entire calculation of cutoffs is done twice – both on a before-tax basis and on an after-tax basis.

### **Differences in after-tax rates and before-tax rates**

After-tax low income cutoffs, and the resulting after-tax rates, have been published back to 1980. The number of people falling below the cutoffs has been consistently lower on an after-tax basis than on a before-tax basis. This result may appear inconsistent at first glance, since incomes after tax cannot be any higher than they are before tax, considering that all transfers, including refundable tax credits, are included in the definition of “before-tax” total income. However, with a relative measure of low income such as the LICO, this result is to be expected with any income tax system which, by and large, taxes those with more income at a higher rate than those with less. “Progressive” tax rates, as they are often called, make the distribution of income more compressed. Therefore, some families that are in low income before taking taxes into account are relatively better off and are not in low income on an after-tax basis.

### **Low income gap**

The low income gap, previously called “low income deficiency”, is the amount that a low income family falls short of the relevant low income cutoff. For the calculation of this gap, negative incomes are treated as zero.

For example, a family with an income of \$15,000 and a relevant low income cutoff of \$20,000 would have a low income gap of \$5,000. In percentage terms this gap would be 25%. The average gap for a given population, whether expressed in dollar or percentage terms, is the average of this value as calculated for each unit.

### **Market Basket Measure**

Human Resources Development Canada has been collaborating with the provincial and territorial ministries of social services to develop a “Market Basket Measure” (MBM). The approach is to cost out a basket of necessary goods and services including food, shelter, clothing and transportation, and a multiplier to cover other essentials. The results would define levels of income needed to cover the cost of the basket.

The same argument that can be made for using after-tax low income rates can be made for using after-tax income to compare to the MBM thresholds. That is, a measure of well-being should take into account what is actually available to spend. The income concept that has been proposed for comparisons with the MBM thresholds goes even further than after-tax income by also removing other non-discretionary expenses such as support payments, work-related child care costs and employee contributions to pension plans and to Employment Insurance. Statistics Canada has started to collect

some of the data necessary to produce rates based on the Market Basket Measure.

This type of measure is often called an “absolute” measure, even though there is clearly judgement involved in specifying the contents of the basket of goods and services. Nevertheless, the line is absolute in the sense that it does not depend directly on the distribution of income.

## On Poverty and Low Income

*Ivan P. Fellegi*  
*Chief Statistician of Canada*

Recently the news media have provided increasing coverage of Statistics Canada’s low income cutoffs and their relationship to the measurement of poverty. At the heart of the debate is the use of the low income cutoffs as poverty lines, even though Statistics Canada has clearly stated, since their publication began over 25 years ago, that they are not. The high profile recently given to this issue has presented Statistics Canada with a welcome opportunity to restate its position on these issues.

Many individuals and organizations both in Canada and abroad understandably want to know how many people and families live in “poverty”, and how these levels change. Reflecting this need, different groups have at different times developed various measures which purported to divide the population into those who were poor and those who were not.

In spite of these efforts, there is still no internationally-accepted definition of poverty unlike measures such as employment, unemployment, gross domestic product, consumer prices, international trade and so on. This is not surprising, perhaps, given the absence of an international consensus on what poverty is and how it should be measured. Such consensus preceded the development of all other international standards.

The lack of an internationally-accepted definition has also reflected indecision as to whether an international standard definition should allow comparisons of well-being across countries compared to some international norm, or whether poverty lines should be established according to the norms within each country.

The proposed poverty lines have included, among others, relative measures (you are poor if your means are small compared to others in your population) and absolute measures (you are poor if you lack the means to buy a specified basket of goods and services designated as essential). Both approaches involve judgmental and, hence, ultimately arbitrary choices.

In the case of the relative approach, the fundamental decision is what fraction of the overall average or median income constitutes poverty. Is it one-half, one-third, or some other proportion? In the case of the absolute approach, the number of individual judgements required to arrive at a poverty line is far larger. Before anyone can calculate the minimum income needed to purchase the “necessities” of life, they must decide what constitutes a “necessity” in food, clothing, shelter and a multitude of other purchases, from transportation to reading material.

The underlying difficulty is due to the fact that poverty is intrinsically a question of social consensus, at a given point in time and in the context of a given country. Someone acceptably well off in terms of the standards in a developing country might well be considered desperately poor in Canada. And even within the same country, the outlook changes over time. A standard of living considered as acceptable in the previous century might well be viewed with abhorrence today.

It is through the political process that democratic societies achieve social consensus in domains that are intrinsically judgmental. The exercise of such value judgements is certainly not the proper role of Canada’s national statistical agency which prides itself on its objectivity, and whose credibility depends on the exercise of that objectivity.

In Canada, the Federal/Provincial/Territorial Working Group on Social Development Research and Information was established to create a method of defining and measuring poverty. This group, created by Human Resources Development Canada and social services ministers in the various jurisdictions, has proposed a preliminary market basket measure of poverty – a basket of market-priced goods and services. The poverty line would be based on the income needed to purchase the items in the basket.

Once governments establish a definition, Statistics Canada will endeavour to estimate the number of people who are poor according to that definition. Certainly that is a task in line with its mandate and its objective approach. In the meantime, Statistics Canada does not and cannot measure the level of poverty” in Canada.

For many years, Statistics Canada has published a set of measures called the low income cutoffs. We regularly and consistently emphasize that these are quite different from measures of poverty. They reflect a well-defined methodology which identifies those who are substantially worse off than the average. Of course, being significantly worse off than the average does not necessarily mean that one is poor.

Nevertheless, in the absence of an accepted definition of poverty, these statistics have been used by many analysts to study the characteristics of the relatively worst off families in Canada. These measures have enabled us to report important trends, such as the changing composition of this group over time. For example, 20 to 30 years ago the elderly were by far the largest group within the “low income” category, while more recently lone-parent families headed by women have grown in significance.

Many people both inside and outside government have found these and other insights to be useful. As a result, when Statistics Canada carried out a wide-ranging public consultation a decade ago, we were almost unanimously urged to continue to publish our low income analyses. Furthermore, in the absence of a generally accepted alternative methodology, the majority of those consulted urged us to continue to use our present definitions.

In the absence of politically-sanctioned social consensus on who should be regarded as “poor”, some people and groups have been using the Statistics Canada low income lines as a de facto definition of poverty. As long as that represents their own considered opinion of how poverty should be defined in Canada, we have no quarrel with them: all of us are free to have our own views. But they certainly do not represent Statistics Canada’s views about how poverty should be defined.

### **Comparisons between data up to 1995 and data since 1996**

In all tables published since the availability of data for 1998, two data sources have been merged into a single time series. Data up to and including 1995 are drawn from the Survey of Consumer Finances (SCF, last conducted for reference year 1997), and data 1996 and onwards are drawn from the Survey of Labour and Income Dynamics (SLID).

Different surveys will produce slightly different estimates on the same topics due to a variety of factors. Every attempt was made to minimize and monitor these differences between the two income surveys, while nonetheless making some important improvements in survey practices. Before replacing the SCF series with SLID, a careful study was done on the overlapping reference years, particularly the years 1996 and 1997, as SLID only acquired its full sample size in 1996. The results of the study are contained in the Income Statistics Division research paper, *A Comparison of the Results of the Survey of Labour and Income Dynamics (SLID) and the Survey of Consumer Finances (SCF) 1993-1997: Update* (75F002MIE99007). All ISD research papers are available free of charge on the Statistics Canada internet site (statcan.ca).

In short, it was found that the two surveys told essentially the same story for all of the main income concepts. It is still possible, nonetheless, that for relatively detailed characteristics the data trends could reveal a “break” as a result of the change in survey. Such a break would likely appear as a noticeable upward or downward shift in a data series between the years 1995 and 1996. It represents a change in the data which is attributable to the two surveys having different samples and different methods (such as the use of tax data in the case of SLID), rather than a true change in the characteristics of the population. Users are advised to take note of the following survey differences which are known to exist and to have had an impact on the data trends at some detailed levels.

#### **Better coverage of small income amounts**

One notable improvement that occurred as a result of new survey techniques introduced in SLID is better coverage of small income amounts received by respondents. It has been observed in surveys conducted by questionnaire that respondents tend to forget or neglect small income amounts they received in the past. This means an underestimation of income in general, and in particular it means that many people who received a small amount of income instead report no income at all (there are differences depending on whether the income concept includes or excludes government transfers, however).

The use of administrative income tax files in SLID for the majority of sample respondents means that there is considerably better coverage of non-zero amounts of income, and in general a greater number of recipients of most kinds of income. Another technique used by SLID which may have improved coverage is that, even for respondents who report income by interview instead of via their tax records, there are two chances to prompt them for income sources, and therefore a greater likelihood of capturing an amount. This is because some income concepts are touched on in the January interview and then covered in the May interview, where it is possible to remind the respondent of a positive response in January. The types of income for which such “dependent interviewing” is used are earnings (from employment or self-employment), employment insurance benefits, social assistance, and worker’s compensation.

#### **Detailed family types**

The standard published “detailed family types” for economic families have changed in one regard. In the SCF, they are derived with reference to the “head of family”. In SLID, the same categories are used but in reference to the “major income earner”. See also “Major income earner” under “Family definitions” in the section on “Notes and definitions”. SLID dropped the concept

of head of family entirely, as it has little relevance in a modern context. But some sort of prioritization of people within a family is useful to uniquely identify the type of family, even if it is somewhat arbitrary.

The change in family concepts resulting from the transition from SCF to SLID has not affected data produced for the entire population of families consisting of two or more persons. However, for some of the detailed family types, the estimated number of families underwent a one-time increase or decrease between 1995 and 1996. Without drawing conclusions about the precise net effects of these changes, the following points can be made.

First, whereas the previous definition always gave husbands the status of head of family rather than wives, with the major income earner concept there is no distinction by sex, and it is possible for the wife to qualify. Since it still holds that wives are on average younger than husbands at least for older couples, this has caused a shift from elderly families to non-elderly families.

Second, the head of family concept gave preference to parents over their adult children and, where there is no husband-wife or parent-child relationship in the family, it gave preference to older members over younger ones. Now, younger adults are much more likely to qualify as major income earners than they did as heads of families. As a result, we see significant decreases in the number of "other elderly families" and "married couples with other relatives", and a large increase in the number of "other non-elderly families". (See the section "Family definitions" for details about the precise definitions of the family types.)

## Comparisons with previous editions

The data for years prior to 1999 are not necessarily directly comparable to those of the 1998 edition. For example, dollar amounts are always expressed in constant dollars of the latest reference year. (See "Current dollars versus constant dollars" under "Analytical concepts".)

For the 1999 edition, the data for the years 1996 to 1998 have been revised slightly on two accounts. First, the number of families has shifted between the two family types "married couples with children" and "married couples living with other relatives" in order to adhere more strictly to the family definitions of the former Survey of Consumer Finances, on which data prior to 1996 are based. Second, the data for certain government transfers and income taxes have been revised on a one-time basis; therefore the data on related concepts such as total income, after-tax income, and even detailed family types (through the impact on the major income earner of the family) may have changed.

At some time in the future, Income Statistics Division will adjust the weights used in the Survey of Labour and Income Dynamics and the former Survey of Consumer Finances, resulting in a historical revision of all income time series data. Weight revisions are periodically necessary to take into account new benchmark population statistics provided by the Population of Census. Such a historical revision, which would be timed with the annual release of SLID data, also provides an opportunity to carry out other types of improvements in the sample design and weighting methods in the interest of improving data quality.

## Sources, Methods and Estimation Procedures

---

### Background

The statistics contained in this publication were derived from the Survey of Consumer Finances (SCF) and the Survey of Labour and Income Dynamics (SLID). For many years, SCF constituted the primary source of data on family income in Canada. In 1993, Statistics Canada introduced a new survey, SLID, with much the same objectives but of longitudinal rather than cross-sectional nature. Over the past five years, Statistics Canada has closely monitored the comparability of these two surveys. The two surveys do indeed produce comparable results. Starting with the 1998 reference year, SLID replaces SCF as the source of annual income estimates. Additional information on the comparability of the SLID and SCF can be obtained in *Bridging Two Surveys: An Integrated Series of Income Data from SCF and SLID, 1989-1997* or in *A Comparison of the Results of the Survey of Income Dynamics (SLID) and the Survey of Consumer Finances (SCF) 1993-1997: Update* (see also Related Products and Services).

This publication presents a wide range of income statistics for a 10 year period. Data from the SCF were used to compute statistics up to 1995 while for 1996 and onwards, SLID is the data source.

### Methodology

#### Survey content

The SCF was an annual survey, conducted each April (but discontinued after April 1998) as a supplement to the Labour Force Survey (LFS), and designed to produce cross-sectional statistics on income by detailed sources. Information on labour force experience and demographic characteristics such as education, family relationships and household composition was also collected, primarily by using data collected for the LFS.

SLID was designed to capture changes in the economic well-being of individuals and families over time and the determinants of labour market and income changes. The survey supports analysis on transitions into and out of the labour force associated with the life cycle or with the business cycle; on the impact of family events on labour market activity and remuneration; on the determinants of income instability; on what triggers shifts into and out of low income and on changes in the composition of income through time. Since SLID additionally carries a broad selection of human capital variables, it is also used for studies of such topics as gender wage and earnings gaps.

The major content themes of SLID are illustrated in the following chart.

**Chart A**

**ORGANIZATION OF CONTENT**

\* Not yet included in survey content

## Survey Universe

SCF and SLID are household surveys that target essentially the same population. Both surveys cover all individuals in Canada, excluding residents of the Yukon, the Northwest Territories and Nunavut, residents of institutions and persons living on Indian reserves. Overall, these exclusions amount to less than 3 percent of the population.

## The Sample

The samples for SLID and SCF are selected from the monthly Labour Force Survey (LFS) and thus share the latter's sample design. The LFS sample is drawn from an area frame and is based on a stratified, multi-stage design that uses probability sampling. The sample is composed of six independent samples. These samples are called rotation groups because each month one sixth of the sample (or one rotation group) is replaced.

The SCF was conducted each year as a supplement to the April LFS using two-thirds of the regular sample (four rotation groups). In total, approximately 35,000 households were surveyed. The SLID sample is composed of two panels. Each panel consists of two LFS rotation groups and includes roughly 15,000 households. A panel is surveyed for a period of six consecutive years. A new panel is introduced every three years. Thus two panels are always overlapping, resulting in a combined cross-sectional sample comparable in size to that of the SCF. The following diagram illustrates how and when panels overlap.

Chart B

### Overlapping design of SLID sample

1	1	1	1	1	1	1	2	2	2	2	2
9	9	9	9	9	9	9	0	0	0	0	0
9	9	9	9	9	9	9	0	0	0	0	0
3	4	5	6	7	8	9	0	1	2	3	4
Panel 1											
			Panel 2								
						Panel 3					
									Panel 4		

## Data Collection

The reference period for the SCF was the previous calendar year. Income questionnaires were mailed out to selected households prior to the April LFS. Information collected through this supplementary income survey, along with demographic and labour market data amassed by the LFS that month, constituted the SCF database.

For each sampled household in SLID, up to 12 interviews are conducted over a six-year period. Every year in

January, interviewers collect information regarding respondents' labour market experiences during the previous calendar year. Information on educational activity and family relationships is also collected at that time. The demographic characteristics of family and household members represent a snapshot of the population as of the end of each calendar year.

Every May information on income is collected from the same sampled households. The income interview is deferred until May to take advantage of income tax time when respondents are more familiar with their income situation. As in the SCF, the reference period for income is the previous calendar year.

To reduce response burden, respondents can give Statistics Canada permission to use their T1 tax information for the purposes of SLID. Those who do so are only contacted for the labour interviews. Over 80% of SLID's respondents give their consent to use their administrative records.

Both SCF and SLID interviews are conducted over the telephone using computer-assisted interviewing (CAI). The interviewer reads the questions as they appear on the computer screen and keys in the reported information. Skip-patterns and edits are built into the collection software, allowing interviewers to immediately detect and resolve response inconsistencies. Collection of date-related information (e.g., employment spells, jobless spells, interruption of work), is greatly improved by the use of such an interactive data capture technique. Another advantage of the CAI technology is the feeding back of details from the previous interview, helping the respondents to recall past events.

Proxy response is accepted in the SCF and SLID. This procedure allows one household member to answer questions on behalf of any or all other members of the household, provided he or she is willing to do so and is knowledgeable.

## Data Quality

There are two types of errors inherent to sample survey data, namely, sampling errors and non-sampling errors. The reliability of survey estimates depends on the combined impact of sampling and non-sampling errors.

## Sampling Errors

Sampling errors occur because inferences about the entire population are based on information obtained from only a sample of the population. The results are usually different from those that would be obtained if information were collected from the whole population. Errors due to the extension of conclusions based on the sample to the entire population are known as sampling errors. The sample design, the variability of the population

characteristics measured by the survey, and the sample size determine the magnitude of the sampling error. In addition, for a given sample design, different methods of estimation will result in sampling errors of different sizes.

### Standard Error and Coefficient of Variation

A common measure of sampling error is the standard error (SE). The standard error measures the degree of variation introduced in estimates by selecting one particular sample rather than another of the same size and design. The standard error may also be used to calculate confidence intervals associated with an estimate (Y). Confidence intervals are used to express the precision of the estimate. It has been demonstrated mathematically that, if the sampling were repeated many times, the true population value would lie within the  $Y \pm 2SE$  confidence interval 95 times out of 100 and within the narrower confidence interval defined by  $Y \pm SE$ , 68 times out of 100. Another important measure of sampling error is given by the coefficient of variation, which is computed as the estimated standard error as a percentage of the estimate Y (i.e.  $100 \times SE / Y$ ).

To illustrate the relationship between the standard error, the confidence intervals and the coefficient of variation, let us take the following example. Suppose that the estimated average income from a given source is \$10,000, and that its corresponding standard error is \$200. The coefficient of variation is therefore equal to 2%. The 95% confidence interval estimated from this sample ranges from \$9,600 to \$10,400, i.e.  $\$10,000 \pm \$400$ . This means that with a 95% degree of confidence, it can be asserted that the average income of the target population is between \$9,600 and \$10,400.

The bootstrap approach is used for the calculation of the standard errors of the estimates presented in this publication. For more information on standard errors and coefficients of variation, refer to the Statistics Canada publication (Catalogue 71-526-XPB), *Methodology of the Canadian Labour Force Survey*.

Standard errors and coefficients of variation of the estimates presented in this publication are available on a cost-recovery basis.

### Suppression

Data reliability cutoffs were established based on variances of a number of different variables. In general, data values that have a coefficient of variation of less than 33% are not suppressed and are reliable to use. Suppressed estimates have a coefficient of variation greater than 33% and are not reliable.

The suppression cutoffs are listed below. Weighted person, family and household estimates that fall below these suppression cut-offs are withheld.

Table D

### Suppression cutoffs

Geography	Weighted counts
Canada	13,000
Newfoundland	2,500
Prince Edward Island	1,500
Nova Scotia	4,000
New Brunswick	2,500
Quebec	14,000
Ontario	14,500
Manitoba	6,500
Saskatchewan	2,500
Alberta	6,000
British Columbia	11,000

### Non-sampling errors

Non-sampling errors generally result from human errors such as inattention, misunderstanding or misinterpretation. The impact of randomly occurring errors over a large number of observations will be minimal. Errors occurring systematically can, on the other hand, have a major impact on the reliability of estimates. Considerable time and effort is invested into reducing non-sampling errors in SLID and SCF.

Non-sampling errors may arise from a variety of sources such as coverage, response, non-response and processing errors.

*Coverage error* arises when sampling frame units do not exactly represent the target population. Units may have been omitted from the sampling frame (undercoverage), or units not in the target population may have been included (overcoverage), or units may have been included more than once (duplicates). Undercoverage, however, represents the most common coverage problem.

Slippage constitutes a measure of survey coverage error. It is defined as the percentage difference between control totals (as obtained from demographic estimates) and weighted sample counts. Slippage rates for household surveys are generally positive because of the more common problem of undercoverage of the population. According to the numbers reported below, in 1999, for example, SLID covered 87.01% of its target population.

Rates are also available upon request for sex, province and age groupings.

Table E

### Slippage Rates in SLID

	1996	1997	1998	1999
Canada (%)	11.46	12.23	12.86	12.99

*Response errors* may be due to many factors, such as faulty questionnaire design, interviewers' or respondents' misinterpretation of questions, or respondents' faulty reporting. Great effort is invested in SCF and SLID to reduce the occurrence of response error. Measures undertaken to minimize response errors include the use of highly-skilled and well-trained interviewers, and supervision of interviewers to detect misinterpretation of instructions or problems with the questionnaire design. Response error can also be brought about by respondents who, willingly or not, provide inaccurate responses.

Income data are especially prone to misreporting, as income is a sensitive issue and includes many items with which respondents are not always familiar. To obtain more accurate information, income data for the SCF and SLID are collected after the income tax "season" when respondents are more familiar with their tax records. Respondents receive information about the income interview prior to the interviewer's telephone call. This gives them time to consult documents and have information available at the time of the interview. Nevertheless, a comparison of data produced from the SCF with other sources suggest that certain income components such as EI benefits and self-employment earnings are under-reported in an income interview. For respondents who grant Statistics Canada permission to access their tax files (the majority of respondents), SLID collects income data directly from administrative files. This procedure reduces misreporting of income in the SLID.

*Non-response errors* occur to some extent in any survey for reasons such as household members being on vacation during the interview period or refusing to supply requested information, despite attempts to obtain complete response from sampled units. For these individuals, the missing data are imputed either explicitly by assigning data to each non-respondent on the basis of a similar respondent record, or implicitly by redistributing the weight of the non-respondent individual to other responding individuals. The bias introduced by non-response increases with the differences between respondent and non-respondent characteristics. Methods employed to compensate for non-response make use of information available for both respondents and non-respondents in an attempt to minimize this bias.

*Processing errors* can occur at various stages in the survey: data capture, editing, coding, weighting or tabulation. The computer-assisted collection method used for SLID and SCF reduces the chance of introducing capture errors because checks for consistency and completeness of the data are built into the computer application. To minimize coding, weighting or tabulation errors, diagnostic tests are carried out periodically. These tests include comparisons of results with other data sources.

## **Weighting**

The estimation of population characteristics from a survey is based on the premise that each sampled unit represents, in addition to itself, a certain number of unsampled units in the population. A basic survey weight is attached to each record to indicate the number of units in the population that are represented by that unit in the sample. Two types of adjustment are then applied to the basic survey weights in order to improve the reliability of the estimates. The basic weights are first inflated to compensate for non-response. The non-response adjusted weights are then further adjusted to ensure that estimates on relevant population characteristics would respect population totals from sources other than the survey. The population totals used for SCF and SLID were based on Statistics Canada's Demography Division population counts for different province-age-sex groups. In SLID, different weights apply for cross-sectional and longitudinal estimates.

## **Cross-sectional representativeness of SLID**

Each longitudinal sample, or "panel" in SLID initially constitutes a representative cross-sectional sample of the population. However, because the real population changes each year, whereas by design the longitudinal sample does not, the sample must be modified to properly reflect these changes to the composition of the population. This is done by adding to the sample all *new* people in the population who are found to be living with the initial respondents (and likewise dropping them from the sample if they leave at later time-points). Conversely, any original respondents who leave the target population (by moving abroad, into institutions, etc.) are given a zero weight for cross-sectional purposes. In this way, the cross-sectional sample, composed of the original respondents minus those who left the target population plus those who have entered it, is virtually fully representative of the population at each subsequent time-point. The missing group is composed of persons who have newly entered the target population and are not living with anyone who was in the target population when the most recent panel was selected. Since SLID introduces a new panel every three years, however, this group is quite small.

## **Response rates**

High response rates are essential for the data quality of any survey and thus considerable effort is invested to encourage effective participation from SCF and SLID respondents.

The response rates are relatively high in both the SCF and SLID. In the SCF it ranged from 78.1% in 1989 to 82.1% in 1995, while SLID's cross-sectional rate of response varied from 87.1% in 1996 to 83.8% in 1999.

The higher SLID response rates are primarily due to the use of administrative data from the tax files.

Note that the response rates are defined at different levels in the two surveys. For SCF, the response rate is calculated at the family level whereas it is based on household response in SLID. For purposes of calculating cross-sectional response rates in SLID, households are defined according to the January household composition. The calculation of the response rate at the household level is based on the response codes for individuals in the household, including both longitudinal respondents and cohabitants. A respondent household is defined as a household that has at least one respondent individual. An individual is defined as a respondent if he or she responded to either the labour or the income interview. Respondent households are divided into completely respondent households and partially respondent households. Partially respondent households are weighted and the missing income data in these households are imputed.

#### Imputation for non-response

Income data are imputed in SCF – and in some cases in SLID – using a “nearest neighbour” approach. This method involves identifying another individual with certain similar characteristics, who becomes the “donor” for the imputed value. SLID also uses other imputation techniques. In fact, the primary method employed for imputing income data in this survey is to use the previous

year’s data, updated for any changes in circumstances. Only in the absence of such data are income figures imputed using the “nearest neighbour” technique in SLID.

Amounts received through certain government programs, such as child tax benefits, the Goods and Services Harmonized Sales Tax Credit, and the Guaranteed Income Supplement, also derived from other information. Data obtained from the tax route are complete and don’t need imputation.

#### Comparability with other income data sources

Comparisons of figures produced from the SCF with other sources of data (Census of Population, Longitudinal Administrative Data, National Economic and Financial Accounts) reveal that certain income components, such as investment, self-employment earnings, social assistance payments and EI benefits, are under-reported in the SCF.

SLID’s estimates of the number of income recipients, aggregate individual income and average family income are higher than the corresponding estimates from SCF data.

Differences between SCF and SLID income figures can be attributed to the different procedures for editing, imputation, and data collection (entirely by questionnaire for the former versus partially by linkage with T1 income tax files for the latter).

Table F

#### Response rate in SCF (1990-1995) and SLID (1996-1999)

Year	1990	1991	1992	1993	1994	1995	1996	1997	1998	1999
Response Rate (%)	79.0	80.0	80.7	80.0	79.5	82.1	87.1	85.2	84.4	83.8

### Canadian Statistics on the Internet

The following data are available, free of charge, on Statistics Canada's website ([www.statcan.ca](http://www.statcan.ca)):

- Average Market Income by Selected Family Types, Canada, 1990-1999
- Average Total Income by Selected Family Types, Canada, 1990-1999
- Average After-Tax Income by Selected Family Types, Canada, 1990-1999
- Government Transfers and Income Tax by After-Tax Income Quintiles, Canada, 1998-1999
- Persons in Low Income Before Tax, Canada, 1990-1999
- Persons in Low Income After Tax, Canada, 1990-1999

*The menu path to download the above-listed tables is "Canadian Statistics" then "The People" followed by "Families, households and Housing" and "Income".*

- Average Earnings by Sex and Work Activity, Canada, 1990-1999
- Estimated numbers of Earners by Sex and Work Activity, Canada, 1990-1999
- Husband-Wife Families: distribution and average income by number of earners, Canada, 1990-1999

*The menu path to download the above-listed tables is "Canadian Statistics" then "The People" followed by "Labour, Employment and Unemployment" and "Earnings".*

### Income in Canada, 1999 (electronic version) 75-202-XIE (\$45)

An electronic version of the present publication is available on Statistics Canada's website ([www.statcan.ca](http://www.statcan.ca)). It includes the following additional tabulations:

#### Market Income

2.2 – Median Market Income by Selected Family Types, Canada, 1990-1999

#### Total Income

4.3 – Median Total Income by Selected Family types, Canada, 1990-1999

#### After-Tax Income

6.2 – Median After-Tax Income by Selected Family Types, Canada, 1990-1999

#### Multiple Income Concepts

7.1 – Average Income by Selected Family Types, Showing Different Income Concepts, Canada and Provinces, 1998 and 1999

- 7.2 – Average Income and Income Shares by After-Tax Income Quintiles, Showing Different Income Concepts, Canada and Provinces, 1990-1999
- 7.3 – Gini Coefficients of Market Income, Total Income and After-Tax Income, Showing Selected Family Types, Canada and Provinces, 1990-1999

### Low Income

- 8.5 – Persons in Low Income Before Tax (1992 LICO base), Showing Prevalence and Estimated Number, Canada and Provinces, 1990-1999
- 8.6 – Percentage of Persons in Low Income Before Tax (1992 LICO base) by Age, Sex and Educational Level, Showing Persistence of Low Income, Canada, Between 1993 and 1999
- 8.7 – Low Income Before Tax (1992 LICO base) by Selected Family Types, Showing Prevalence, Estimated Number and Average Income Gap, Canada, 1990-1999
- 8.8 – Low Income Before Tax Cut-Offs (1992 LICO base), 1990-1999

### Background Tables

- 9.1 – Number of Persons by Selected Family Types, Canada and Provinces, 1990-1999
- 9.2 – Number of Families by Selected Family Types, Canada and Provinces, 1990-1999

*The menu path to download the electronic version is "Products and Services", then Downloadable publications (45\$)", followed by "75-202-XIE, Income in Canada, 1999."*

### Income Trends in Canada, 13F0022XCB (\$195)

This annual CD-ROM, which includes over 2 million data points, is the complement to *Income in Canada, 1999*. It provides historical trends starting in 1980, for Canada, the provinces and 15 metropolitan areas. The data are presented in Beyond 20/20TM format that allows users to easily view trends, create tables and chart income. The 1999 edition will be available in late 2001.

### Longitudinal data from the Survey of Labour and Income Dynamics (SLID)

Starting with reference year 1998, the Survey of Labour and Income Dynamics (SLID) officially replaced the Survey of Consumers Finances (SCF) as the source of income data.

SLID is a longitudinal survey – the same people are interviewed from one year to the next for a period of six years – that began collecting data with the 1993 reference year.

The income content of the two surveys is similar, with SLID adding a large selection of variables that capture transitions in Canadians' jobs, income and family events. Therefore, SLID opens new research avenues that will provide greater insights on important issues, such as how many Canadians remain in low income situations and what makes it possible for others to emerge from periods of low income.

Paradoxically, the comprehensive data that make SLID so valuable, also makes it more complex for Statistics Canada to ensure that confidentiality of respondents is maintained.

In order to comply with the strict confidentiality provisions of the Statistics Act, SLID longitudinal data are made available through new modes of dissemination, namely:

*remote access:* computer program(s) are written by clients and sent electronically to Statistics Canada, where staff run the program(s) against the data base and apply confidentiality protection measures. If need be, data are suppressed from the output. Survey officers subsequently return results to clients;

*on premise access:* researchers under contract with Statistics Canada are given access to Regional Reference Centers across the country, where staff provides data retrieval infrastructure and implements confidentiality procedures;

*research data centres:* were opened on selected university campuses across the country, in 2000. These centers will act as extensions of Statistics Canada and provide researchers with access to the data, while protecting confidentiality.

### Public Use Microdata Files

Cross-sectional public use microdata files for 1996 to 1998 are available modeled on the Survey of Consumer Finances microdata data files. It is anticipated that 1999 will be released in 2002. No longitudinal public use microdata files are presently planned.

### Research and Working Papers

Statistics Canada publishes a variety of research and working papers that are made available free of charge on its website ([www.statcan.ca](http://www.statcan.ca)). Listed below is a selection of recent papers, for readers interested in income trends. Several other reports are also available.

- Should the low income cutoffs be updated? A summary of feedback on Statistics Canada's discussion paper 75F0002MIE00011

- To What Extent are Canadians Exposed to Low Income? 75F0002MIE99001
- The Persistent Gap: New Evidence on the Canadian Gender Wage Gap 75F0002MIE99008
- A Comparison of the Results of the Survey of Labour and Income Dynamics (SLID) and the Survey of Consumer Finances (SCF) 1993-1997: Update 75F002MIE99007
- Should the Low Income Cutoffs be Updated? A Discussion Paper 75F0002MIE99009

*The menu path to download the above-listed papers is "Our Products and Services" then "Research papers (free)" followed by the catalogue number*

- The Performance of the 1990s Canadian Labour Market 11F0019MIE00148
- Why Do Children Move Into and Out of Low Income: Changing Labour Market Conditions or Marriage and Divorce? 11F0019MIE99132
- Social Transfers, Earnings and Low-Income Intensity Among Canadian Children, 1981-1996: Highlighting Recent Developments in Low-Income Measurement 11F0019MIE00144
- The Maturation of Canada's Retirement Income System: Income Levels, Income Inequality and Low-Income among the Elderly 11F0019MIE00147

*The menu path to download the last four papers listed above is "Our Products and Services" then "Research papers (free)" followed by catalogue number.*

### **SLID Documentation for Researchers**

- Survey Overview – Survey of Labour and Income Dynamics 75F0011XIE
- Survey of Labour and Income Dynamics Microdata User's Guide 75M0001GIE

*The menu path to download the above-listed working papers is "Our Products and Services" then "Free publications" followed by the catalogue number.*

- SLID Electronic Data Dictionary 75F0026XIB

*The menu path to download this document is "Statistical methods " followed by "Questionnaires and data dictionaries" followed by "SLID electronic data dictionary".*

### **Publications from the Survey of Consumer Finances**

The transition from the Survey of Consumer Finances to the Survey of Labour and Income Dynamics has also triggered a revision of the income product line. With the introduction of *Income in Canada (the print and electronic editions)* and *Income Trends in Canada CD-ROM*, the following SCF publications are discontinued:

- 13-207-XPB Income Distribution by Size in Canada
- 13-210-XPB Income After Tax: Distribution by Size in Canada
- 13-551-XPB Low Income Cut-offs
- 13-569-XPB Low Income Persons
- 13-592-XPB Low Income After Tax
- 13-582-XPB Low Income Measures
- 13F0019XPB Low Income Measures, Low Income After Tax Cut-Offs and Low Income After Tax Measures
- 13-208-XPB Census Family Incomes
- 12-215-XPB Characteristics of Dual-Earner Families
- 13-217-XPB Earnings of Men and Women

### **Perspectives on Labour and Income 75-001-XPE**

*Perspectives on Labour and Income* is a quarterly journal that features analytical articles on the latest trends. It includes a section that summarizes recent reports and studies released by Statistics Canada. Subscribing to *Perspectives on Labour and Income* will prove to be an excellent way to keep up-to-date on what's new, all year long!

### **Client Services**

For clients with more specialized data needs, custom tabulations can be produced on a cost-recovery basis. For more information or to enquire about the concepts, methods, data quality or the product line, contact Client Services (1 888 297-7355 or 613 951-7355; income@statcan.ca), Income Statistics Division.
