## Acknowledgements

The author wishes to thank all those involved in the development, production, and release of the National Graduates Survey at Statistics Canada (STC) and Human Resources and Skills Development Canada (HRSDC). A particular thank you is extended to the Council on Post-Secondary Education (COPSE) for their financial support of this analysis and to Danielle Baum for her indispensable help in preparing the manuscript for publication.

## Note of appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

## Highlights

- Manitoba graduates were just as likely to be employed as graduates in the rest of the country, but they tended to have lower incomes, a reflection of the Manitoba labour market in general.
- Manitoba graduates were less likely to have incurred debt during their studies than the average Canadian graduate, and the average debt for college graduates in the province was lower than their national counterparts' average debt.

## Summary

Graduates from the province of Manitoba shared many characteristics with graduates from all Canadian institutions. However, there were a few notable differences. Graduates from Manitoba were more likely to be of Aboriginal origin, but were less diverse than graduates from the Class of 2000 in terms of visible minorities, citizenship and mother tongue. Graduates from Manitoba were also more likely than graduates from all Canadian institutions to have completed a bachelor degree. They generally took longer to complete their program and college graduates in Manitoba were more likely to delay entry into postsecondary education.

While most Manitoba graduates from the Class of 2000 stayed in the province after graduation, Manitoba lost more students and graduates than it gained, because they were attracted to educational institutions or labour markets outside the province. Master and doctoral graduates were the most mobile. In addition, there were high levels of mobility among bachelor and master graduates who pursued further studies after graduation.

In most cases, Manitoban graduates were just as likely to find employment as graduates in the rest of the country, but they tended to have lower incomes, a reflection of the Manitoba labour market in general. In contrast with Canadian graduates at the college, bachelor and master level, only female college graduates working in Manitoba in 2002 had lower earnings than their male counterparts.

Manitoba graduates were less likely to have incurred debt during their studies than the average Canadian graduate. The debt incurred by college graduates in Manitoba was lower than that of the Canadian average, but the ratio of their debt repayment to their income was higher. However, they were not more likely than Canadian college graduates overall to report difficulties in repaying their loans.

Debts to other loans were paid off more quickly than debts to student loans: by 2002, about twice as many graduates completely paid off their debts to other loans. This was true for both graduates from Manitoba and all graduates from Canadian institutions.

Aboriginal graduates in Manitoba were generally more likely than non-Aboriginal graduates in the province to have obtained a college diploma, and this proportion roughly reflected the proportion of Aboriginal people in the general population. In contrast, Aboriginal people were under-represented at the bachelor level, and hardly represented at higher levels of study. As well, the fields of study chosen by both Aboriginal college and bachelor graduates were not the same as those chosen by their non-Aboriginal counterparts in the province and this choice may have had an impact on labour market outcomes of college Aboriginal graduates. They were less likely to be employed than their non-Aboriginal counterparts in the province and, compared with their Aboriginal counterparts outside the province, their earnings were lower.

## Introduction

The system of postsecondary education in Manitoba plays an important role in the social and economic health of the province. Colleges and universities strive to meet the lifelong learning needs of Manitobans and to ensure the availability of individuals with the right skills to support a growing and changing economy.

This report uses data from the National Graduates Survey (Class of 2000) and asks who are the graduates of Manitoba's universities and colleges, what do they do after graduation, and how well do they integrate into the labour market? In particular, the report provides a portrait of the graduates from Manitoba's postsecondary institutions, analyses the mobility of students and graduates into and out of the province, looks at graduates' outcomes in the work force, and examines the student debt load of graduates. In addition, the report includes a special analysis of Aboriginal graduates.

### The National Graduates Survey

The National Graduates Survey (NGS) is designed to measure the short to medium-term labour market outcomes of graduates from Canadian publicly-funded university, college and trade/vocational programs. NGS interviews graduates two and five years after graduation. To date, five graduating classes have been surveyed: 1982, 1986, 1990, 1995 and 2000. Data collected from the NGS can examine graduates' initial transitions from school to the labour market in order to see how complex these transitions are, whether graduates moved in relation to their education or their work, how successful they are in the workforce after graduation and the cost of their postsecondary education. The survey therefore provides relevant data not only on the outcomes related to higher education, but also on the experience of completing postsecondary education in Canada.

This report looks at graduates who, in 2000, completed the requirements or obtained their degree, diploma or certificate from a college or university program such as bachelor (including first professional degrees such as Law and Medicine), master and doctorate. Unless otherwise noted, the results for graduates from Manitoba institutions (columns marked "Manitoba – 2000 province of study") are compared to those for all graduates from Canadian institutions in 2000 (columns marked "All graduates"). For reference purposes, tables may also contain data on graduates from any Canadian institution who lived in the province of Manitoba in 2002 (columns marked "Manitoba – 2002 province of residence"). These graduates may or may not have studied in the province.

## Section 1: Who were the graduates?

In 2000, an estimated 7,700 students graduated from postsecondary college and university programs in the province of Manitoba. They represented 3% of the nearly 270,000 graduates in Canada from that same year. This proportion is slightly lower than the proportion of the population in Manitoba in comparison with the entire Canadian population (3.7%).

College and university graduates from Manitoba shared many characteristics with the Class of 2000 graduates nationally. However, there were a few notable differences. While graduates from Manitoba were more likely than graduates from Canadian institutions to have Aboriginal origins, they had less diversity in terms of visible minorities, citizenship and mother tongue.

In Manitoba and in Canada overall, women made up the majority of graduates at all levels of study except the doctorate. Women made up about 60% of all college, bachelor and master graduates and 40% of doctoral graduates.

Graduates from Manitoba finished their program at about the same age as other graduates from Canadian institutions. Median and average ages at graduation were very similar. As well, there was a significant number of older graduates at the college and at the bachelor level, accounting for approximately 40% of all graduates at each of these levels for both graduates from Manitoba and graduates from all Canadian institutions (see Table 1).

**Note:** Caution is advised when comparing estimates. High sampling variability errors for some estimates means that many apparent differences are not statistically significant. When differences are significant, they are generally noted in the text.

**Graduates from Manitoba were more likely to have Aboriginal origins, but fewer were members of visible minorities or foreign-born.**

The Aboriginal population makes up a greater proportion of the population in Manitoba than in Canada overall. One in seven (14%) Manitobans identified themselves as Aboriginal in the 2001 Census, compared to only 3% nationally. This difference was also reflected in the Class of 2000. At the college level, Aboriginal graduates accounted for 17% of all college graduates from Manitoba, compared with 4% of college graduates nationally. At the bachelor level, the proportion of Aboriginal graduates in Manitoba was 7%, compared with only 2% of bachelor graduates nationally. There were few Aboriginal graduates at the higher levels of university study. (A more detailed discussion of Aboriginal graduates from the Class of 2000 is presented later in this report.)

Compared with college and bachelor graduates in Manitoba, there were proportionally more members of visible minorities at the master and doctoral levels in the province. They were about equally as likely to be members of visible minorities as graduates in Canada overall. In contrast, college and bachelor graduates from Manitoba were less likely to be members of visible minorities than the national average (see Figure 1).

**Figure 1**  
**Proportion of graduates who were members of visible minorities from the Class of 2000, by level of study**

Graduates from Manitoba were less diverse than graduates from Canadian institutions overall. At all levels except the doctorate, graduates from Manitoba were more likely to be Canadian citizens by birth, while graduates at the national level had higher proportions of Canadian citizens by naturalization (see Table A-1)<sup>1</sup>.

## Manitoba graduates were more likely to be Anglophone than graduates outside Quebec.

In some ways, Manitoban graduates were typical of graduates from Canadian institutions outside of Quebec when it came to their mother tongue. At all levels of study, English was the most common mother tongue for both groups. At higher levels of study, graduates in both groups also closely resembled each other in their linguistic profile. However, at the lower levels of study, there were some differences. Manitoba graduates were more likely than graduates outside Quebec to have English as a mother tongue at the college and bachelor levels.

Having a mother tongue other than English or French was another point of difference between the graduates from Manitoba and graduates from Canadian institutions outside of Quebec. College and bachelor graduates outside of Quebec were more likely than Manitobans to have a mother tongue other than English and French, but master and doctoral graduates outside of Quebec were as likely as Manitobans to have a mother tongue other than English or French (see Table 2).

### Analysis of languages in Canada

Mother tongue is the first language spoken and still understood at the time of the interview. French is considered a minority language in all provinces except Quebec, where the majority of the residents indicate French as a mother tongue. Because Quebec has a large number of graduates, Canadian results in the proportion of French as a mother tongue are influenced by that fact. It therefore becomes difficult to directly compare Manitoba's results to that of Canada overall. To circumvent this problem, analysis is done on graduates from Canadian institutions excluding those who graduated from a Quebec program in 2000. However, for reference purposes, results from graduates from all Canadian institutions are presented along with those of the "Graduates excluding Quebec."

**Table 2**  
**Language characteristics of 2000 postsecondary graduates by level of study**

**Notes:** Proportions may not add up to 100 due to multiple responses.

Caution is advised when comparing estimates. High sampling variability errors for some estimates means that many apparent differences are not statistically significant. When differences are significant, they are generally noted in the text.

## Section 2: What was the graduates' experience during postsecondary studies?

Compared with Canadian graduates overall, a college education was less common in Manitoba. Reflecting this, graduates from Manitoba were more likely than graduates from all Canadian institutions to have completed a bachelor degree. Nearly six out of ten graduates from Manitoba completed the requirements for a bachelor degree in 2000, compared with only half of graduates from the Class of 2000.

### Postsecondary education in Manitoba

The province of Manitoba has a variety of postsecondary institutions. It has four universities and four colleges<sup>2</sup>, a number of private religious institutions and private vocational institutions, as well as a distance education delivery network. The current analysis does not include information on graduates from private institutions as only publicly-funded institutions are part of the National Graduates Survey.

For more information on postsecondary education in Manitoba, visit the government's website at [www.edu.gov.mb.ca](http://www.edu.gov.mb.ca) or the Council on Post-Secondary Education (COPSE) website at [www.copse.mb.ca](http://www.copse.mb.ca).

### Bachelor and master graduates from Manitoba took a longer time to complete their program of study.

At the college level, Manitoban graduates on average took less time to complete their program<sup>3</sup>, but they took more time at the bachelor and master levels. Among graduates who pursued their studies full-time, college graduates in the province of Manitoba took an average of 16 months to complete their program of study, compared with 21 months at the national level. At the higher levels, Manitoban graduates took an average of 4 months longer at the bachelor level and 13 months longer at the master level (Table A-1).

The reasons behind these differences are not easily explained. While it is possible to control for certain factors, other information such as the normal length of the programs, was not available for analysis. While only graduates who pursued their studies full-time were included in the calculation, it is possible that some graduates did not take the full load of courses, which would affect the length of time to complete the program<sup>4</sup>. Programs were also separated by level of study (college, bachelor, master and doctorate), because different lengths of time are needed to complete them. Although the proportions of the different diplomas, certificates and degrees within a level of study were the same, it was not possible to control for non-standard programs (such as accelerated programs) within the level the study. Finally, graduates from Manitoba were no more likely than graduates from Canadian institutions overall to take a leave of absence from their studies.

## College graduates from Manitoba were more likely to delay entry into postsecondary education.

Past analysis of the NGS showed that graduates tend to take a variety of pathways into and through postsecondary education. The flow of young graduates from secondary school directly into postsecondary education and then directly into the workforce is not necessarily the most common pathway taken<sup>5</sup>. Other analysis on youth transitions after secondary school also shows that the transition from school into the workforce is made through a complex set of pathways<sup>6</sup>.

### Analysis of postsecondary education pathways in Canada

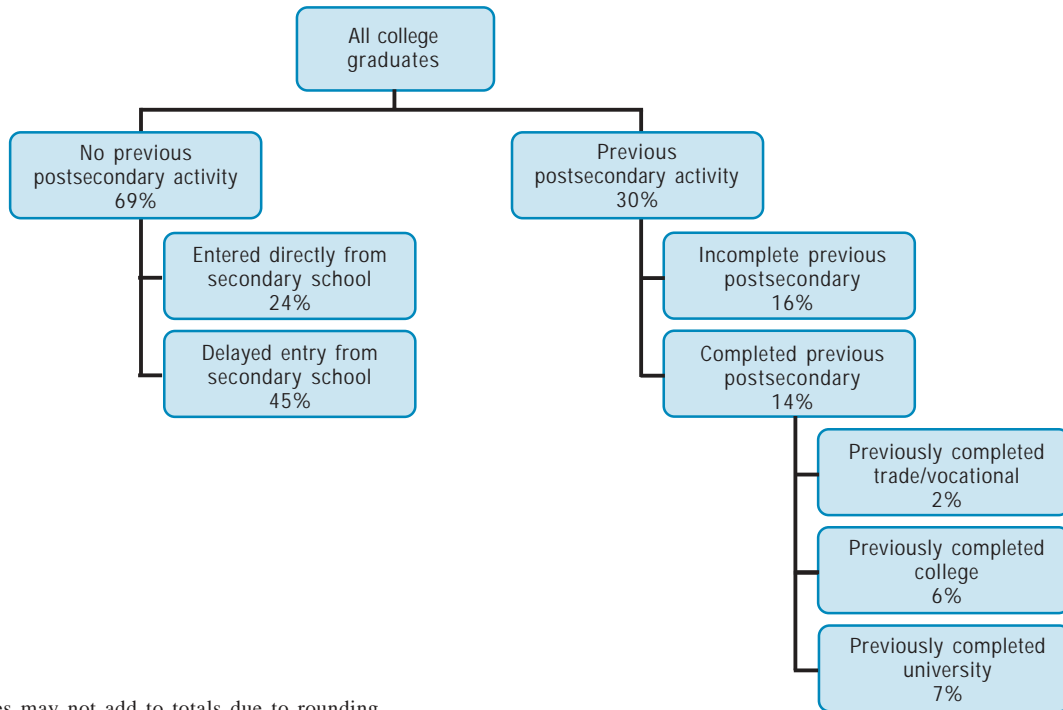

At the Canada level, the percentage of graduates who had completed postsecondary activities prior to enrolment in the 2000 reference program is driven by Quebec graduates, where completion of CEGEP is generally required for entry into university. In fact, 60% of bachelor graduates from Quebec universities reported that they had previously completed college or CEGEP, and another 12% reported having some college or CEGEP. Outside of Quebec, only 6% of graduates reported having completed college or CEGEP prior to entering their program.

For this reason, comparison of activities prior to graduation at the college and at the bachelor level between Manitoba graduates and all graduates from Canada should be made with caution. To help clarify this issue, national data excluding Quebec graduates are used for the analysis, but both are presented (see Table A-2).

Complex pathways through postsecondary education were also typical of the Class of 2000 and of Manitoba graduates. Slightly less than a third of graduates had some postsecondary experience prior to the 2000 program. Although the majority did not have any previous postsecondary experience, many did not enter into their postsecondary education directly after secondary school. In fact, college graduates from the province of Manitoba were less likely to enter into postsecondary education directly after secondary school, when compared to other graduates outside of Quebec. They were also three times more likely than bachelor graduates within the province to delay their entry into postsecondary education (see Figures 2a and 2b and Table A-2).

**Figure 2a**

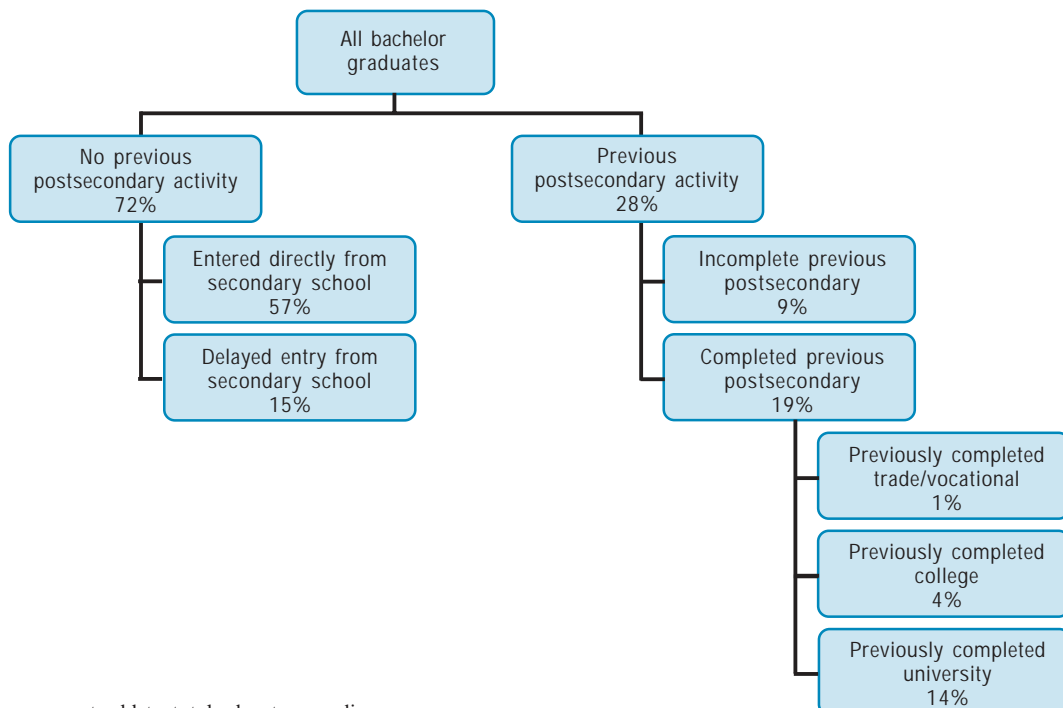

**Postsecondary pathways of college graduates from Manitoba, prior to entry into their program**

**Note:** Figures may not add to totals due to rounding.

**Figure 2b**

**Postsecondary pathways of bachelor graduates from Manitoba, prior to entry into their program**

**Note:** Figures may not add to totals due to rounding.

## Section 3: Did graduates remain in Manitoba?

In a knowledge-based global economy, the skills and competencies of workers within a province are very valuable. Losing these skills may mean shortages in specific occupations and may limit economic growth. On the other hand, it can be anticipated that some individuals will leave a province, particularly those in fields where jobs are clustered in other locations or those who pursue advanced postsecondary education. Therefore, understanding mobility into and out of the province is important for understanding the relationship between the postsecondary system, the educational needs of the population and the labour market. Traditional transition surveys generally cannot measure the full mobility within a jurisdiction as they focus on a single geographic area (e.g. province) and are thus only able to only measure how many leave. However, the National Graduates Survey (NGS), with its national scope, can look at graduates from other jurisdictions who are attracted to the province of Manitoba, as well as those who leave. Information on the specific provinces these graduates come from or go to is also available, but not analysed in detail in this report.

### Student mobility and graduate mobility

The National Graduates Survey (NGS) collects information on principal residence of graduates at three points in time. The first is the principal residence in the twelve months prior to enrolment in their program; the second is the province or territory in which they studied and the third is the location of the primary residence at the time of the 2002 interview. With this information, it is possible to measure the mobility prior to enrolment, that is, "student mobility" and the mobility after obtaining or completing the degree, diploma or certificate in 2000, that is, "graduate mobility."

The Class of 2000 is the first NGS to collect information on mobility to the United States after graduation. Therefore, "graduate mobility" includes graduates who moved south of the border. For this reason, mobility of graduates presented in this report is not comparable to reported mobility data using previous NGS data.

### The majority of graduates who ever lived in Manitoba were residents over time.

About 9,300 graduates from the Class of 2000 lived in Manitoba either prior to enrolment, during their studies or after graduation. About 7,700 of these graduated from college and university programs in Manitoba in 2000, and about two-thirds of the 9,300 Manitoban residents lived in the province at all three points in time. Therefore, only about a third were mobile. Mobility may be either entering or leaving the province, and may have been done either prior to their studies (student mobility) or after graduation (graduate mobility).

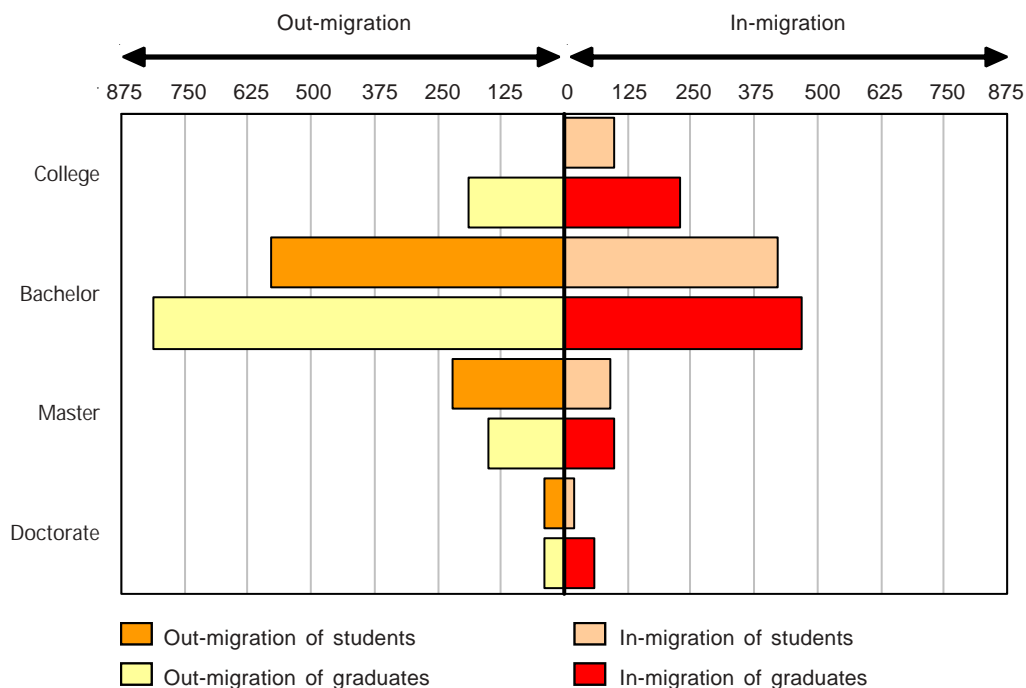

## Manitoba lost more students and graduates than it gained.

While the majority of students and graduates lived in Manitoba at all three points in time, the province did, however, lose more students and graduates than it gained. Prior to enrolment in their program, 8,000 students from the Class of 2000 lived in Manitoba. Of these, about 1,000 left the province to study elsewhere for their 2000 program. About 600 came into the province from elsewhere to complete their studies, resulting in a net loss. At the time of graduation, there were 7,700 graduates in Manitoba, but two years later, there were about 7,400. After graduation, about 1,200 graduates moved to a location outside of the province, while about 900 moved into the province (see Table A-3).

**Figure 3**

### Mobility characteristics of the Class of 2000, Manitoba graduates, by level of study

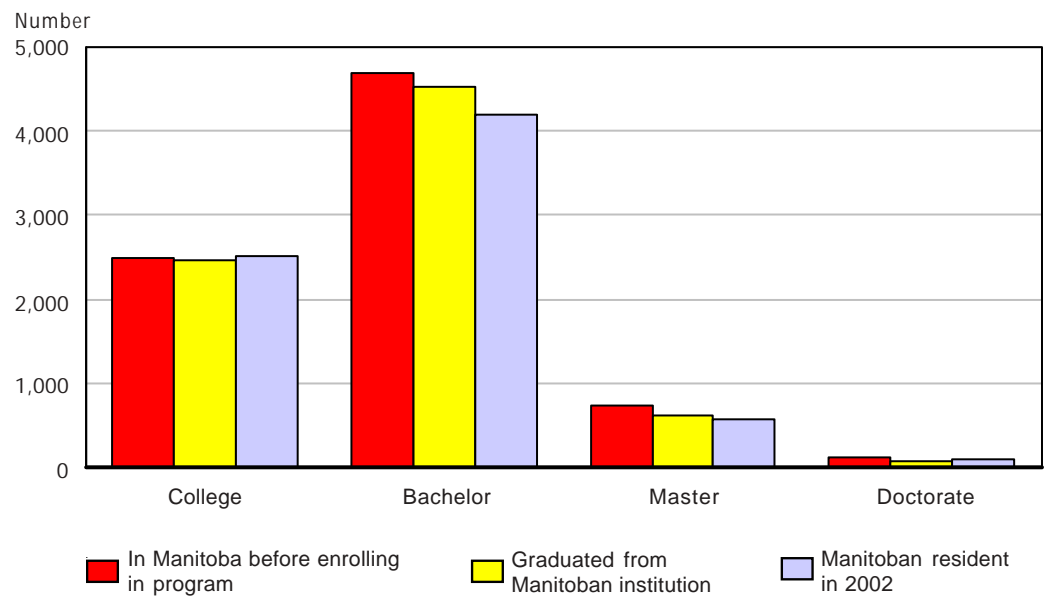

### There was no net migration out of the province at the college level.

Based on the level of study obtained in 2000, the number of residents in Manitoba at the college level remained fairly constant over time, so that there was no net migration out of the province over time. At each of the three points in time, there were about 2,500 college graduates from the Class of 2000 living in Manitoba (see Figure 4). The greatest proportion of net migration out of the province was at the master level. In 2002, there were 24% less graduates from this level living in Manitoba, when compared with the number of those at this level who lived in the province prior to enrolment. At the bachelor level, the net migration out of the province was 11% (see Table A-3).

**Figure 4**

**Number of students and graduates living in Manitoba, by level of study and time of residence**

## Section 4: Who were the mobile students and graduates from Manitoba?

With data on the residence of graduates from prior to enrolment, during their studies and at the time of the 2002 interview, it is possible to track those who come from, study in or settle in the province of Manitoba. With the aid of these residential flows (see Table 3), it is possible to focus on particular patterns of mobility, and therefore describe the characteristics of the mobile students and graduates from the province.

### Comparison of graduates in Manitoba based on residence flows

#### All graduates:

These were the 9,300 graduates from the Class of 2000 who had ever lived in the province of Manitoba (all lines in Table 3). However, it does not include graduates who may have lived in Manitoba at a point prior to the three periods presented. For example, it would not include doctoral graduates who completed their master program outside of Manitoba, but who were originally from the province or may have completed their bachelor degree in Manitoba.

#### Non-migrants:

These were the 6,200 graduates from the Class of 2000 who lived in Manitoba at all three reference points: prior to enrolment, during their studies and after graduation (1<sup>st</sup> line in Table 3).

#### Migrants:

Three groups of migrants can be created based on their flows through the province.

- 1) Graduates who left Manitoba and did not yet return: These were the graduates who were in Manitoba prior to enrolment but were no longer living in the province in 2002. They include a) the 890 graduates who lived in Manitoba prior to enrolment and during their studies, but lived elsewhere in 2002 and b) the 720 graduates who left the province to study elsewhere and had not returned after their studies (2<sup>nd</sup> and 5<sup>th</sup> lines in Table 3).
- 2) Graduates who entered the province and did not leave: These were graduates who did not live in Manitoba prior to enrolment but were residents of the province in 2002. They include a) the 330 students who moved to Manitoba from elsewhere to enrol in their 2000 program and who still lived in the province in 2002 and b) the 590 who were new to the province in 2002, having moved to the province after their 2000 graduation (3<sup>rd</sup> and 7<sup>th</sup> lines in Table 3). About two-thirds of the graduates in this category are those who studied elsewhere and were new to the province in 2002.
- 3) Graduates who have both left and entered the province: These were a) the 270 graduates who did not study in the province, but who were residents of Manitoba both prior to their studies and in 2002 or b) the 300 graduates who lived in the province to study, but were not residents either before their studies or after graduation (4<sup>th</sup> and 6<sup>th</sup> lines in Table 3).

**Table 3**  
**Number of graduates by level of study in 2000 and residence flows through the province of Manitoba**

| Residence in Manitoba              |                               |                             | Level of study – 2000 |              |            |            |              |
|------------------------------------|-------------------------------|-----------------------------|-----------------------|--------------|------------|------------|--------------|
| Prior to enrolment in 2000 program | During studies (2000 program) | At time of interview (2002) | College               | Bachelor     | Master     | Doctorate  | All levels   |
|                                    |                               |                             | 2,210                 | 3,510        | 420        | 40         | 6,180        |
|                                    |                               |                             | 160                   | 600          | 100        | 30*        | 890          |
|                                    |                               |                             | 70                    | 210          | x          | x          | 330          |
|                                    |                               |                             | 50**                  | 170*         | x          | x          | 270          |
|                                    |                               |                             | F                     | 410*         | 180**      | 30*        | 720          |
|                                    |                               |                             | 30*                   | 210          | 50         | 10*        | 300          |
|                                    |                               |                             | 180**                 | 300*         | 60*        | 50*        | 590          |
| <b>Total</b>                       |                               |                             | <b>2,790</b>          | <b>5,415</b> | <b>890</b> | <b>180</b> | <b>9,260</b> |

\*\* numbers marked with this symbol have a coefficient of variation greater than 25% and less or equal to 33.3% and are very unreliable

F too unreliable to be published (coefficient of variation surpasses 33.3%)

**Notes:** Numbers are rounded to the nearest 10, but analysis is carried out on unrounded numbers.

Caution is advised when comparing estimates. High sampling variability errors for some estimates means that many apparent differences are not statistically significant. When differences are significant, they are generally noted in the text.

### Those who left the province were more likely to be graduates at the master and doctoral level.

While the majority of graduates did not change provinces, there is an interest in any loss of skilled individuals. Therefore, it is important to look at those who were in the province originally, and who left the province. About 1,600 college and university graduates from the Class of 2000 lived in Manitoba prior to their enrolment in the 2000 program, but were no longer residents of the province in 2002. They represented 17% of those who ever lived in Manitoba.

Those who left the province were more likely to be graduates at the master or doctoral level. At the college level, 10% of those living in Manitoba prior to enrolment eventually left the province and were no longer residents in 2002. This was true for 22% of bachelor graduates, 38% of master graduates and 54% of doctoral graduates<sup>7</sup>.

### Those who moved out of the province were as likely to move east as west.

With the exception of graduates at the master level, graduates from the Class of 2000 who left Manitoba and were no longer residents of the province in 2002 were as likely to have moved east of the province as to have moved more to the west. Graduates from the master level were more likely to move east. However, doctoral graduates also had a third location to which they were as likely to move to: the United States (see Table 4).

**Table 4****2002 location of residence of Class of 2000 graduates who left Manitoba**

|                           | College | Bachelor | Master | Doctorate |

| West or North of Manitoba | 55*     | 47       | 25**   | 37*       |
| United States             | F       | 11*      | 8**    | 29*       |

\* numbers marked with this symbol have a coefficient of variation between 16.6% and 25% and are less reliable than unmarked numbers

\*\* numbers marked with this symbol have a coefficient of variation greater than 25% and less or equal to 33.3% and are very unreliable

F too unreliable to be published (coefficient of variation surpasses 33.3%)

**Note:** Caution is advised when comparing estimates. High sampling variability errors for some estimates means that many apparent differences are not statistically significant. When differences are significant, they are generally noted in the text.

### About one in ten graduates ever living in Manitoba entered the province from elsewhere.

Mobility is not only about leaving the province. Even as graduates left the province and were no longer residents of Manitoba by 2002, a number of graduates entered the province over time. About 900 or one in ten graduates who ever lived in Manitoba arrived in the province from elsewhere, and were still in the province in 2002. Of these, six out of ten entered the province after graduation.

### Manitoba attracted graduates wanting to pursue additional education.

Bachelor graduates were typically the most likely to pursue further education, and many bachelor graduates who entered the province after graduation were there to pursue further education. About 40% of the 300 bachelor graduates who entered after graduation were enrolled full-time in postsecondary education at the time of the 2002 interview. In contrast, 15% of the 3,510 who lived in the province at all three points in time and 25% of the 600 who lived in the province both prior to enrolment and during their studies, but who left after graduation were enrolled full-time in postsecondary education at the time of the 2002 interview.

At the master level, those who moved into the province to study and were still there in 2002 were more likely than those who did not move to have pursued further education. About 25% of the 40 master students who moved into the province to enrol for the 2000 program and remained after graduation were enrolled in full-time education in the province in 2002. In contrast, 8% of the 420 from this level who lived in the province at all three points in time were enrolled in full-time education in the province in 2002.

Mobility is often encouraged in the pursuit of graduate education, such as master and doctoral degrees. Doctoral graduates may therefore have previously moved to enrol in either their bachelor or their master degree. Those who moved to the province after graduation, but completed their studies elsewhere, may have originated from the province, but information in the current NGS does not allow us to track these previous movements. However, with the follow-up of the NGS, it

will be possible to track the current bachelor and master graduates who pursue further education, and to see whether those who left the province to study elsewhere return to Manitoba after completing their studies.

#### **Impact of considering province of study versus province of residence at interview**

The National Graduates Survey (NGS) interviews graduates of postsecondary programs from a given reference year and also obtains information on the graduates' location of residence at the time of the interview, approximately two years after graduation. This information can allow comparison of graduates from a given province to the graduates who live in that province two years after graduation, if such a comparison is warranted. In this particular instance, Class of 2000 graduates from the province of Manitoba can be compared to graduates who are living in Manitoba at the time of the 2002 interview.

The two profiles closely resemble each other in many instances, but some differences can be noted at the doctoral level. With the analysis of mobility, it becomes clear that these differences are likely due to the fact that doctoral graduates who studied in the province are not the same people as the doctoral graduates who live in the province in 2002.

## Section 5: Were educational activities pursued after graduation?

Many graduates choose to continue their studies after graduation, particularly bachelor graduates. However, college and bachelor graduates from the province of Manitoba were slightly less likely than graduates from Canadian institutions overall to have pursued further education. Graduates living in Manitoba in 2002 were, however, as likely as graduates from all Canadian institutions to be enrolled in full-time education in 2002 (see Table 5).

**Table 5**

### Educational activities of the Class of 2000 after their graduation, by level of study

|   | Manitoba – 2000<br>province of study | All graduates |
|---|--------------------------------------|---------------|
|   | %                                    |               |
| <b>College</b>                                    |                                      |               |
| Pursued further education after 2000 graduation   | 21                                   | 26            |
| Completed further education after 2000 graduation | 5                                    | 9             |
| Enrolled in full-time education in 2002           | 8                                    | 8             |
| <b>Bachelor</b>                                   |                                      |               |
| Pursued further education after 2000 graduation   | 36                                   | 41            |
| Completed further education after 2000 graduation | 10                                   | 15            |
| Enrolled in full-time education in 2002           | 16                                   | 15            |
| <b>Master</b>                                     |                                      |               |
| Pursued further education after 2000 graduation   | 23                                   | 28            |
| Completed further education after 2000 graduation | 4                                    | 7             |
| Enrolled in full-time education in 2002           | 12                                   | 14            |
| <b>Doctorate</b>                                  |                                      |               |
| Pursued further education after 2000 graduation   | x                                    | 11            |
| Completed further education after 2000 graduation | x                                    | 4             |
| Enrolled in full-time education in 2002           | x                                    | 6             |

x suppressed to meet confidentiality requirements of the *Statistics Act*

**Note:** Caution is advised when comparing estimates. High sampling variability errors for some estimates means that many apparent differences are not statistically significant. When differences are significant, they are generally noted in the text.

Pursuit of further education after their 2000 graduation may have an impact on the labour market outcomes of graduates in 2002. Graduates who completed further education may have a higher level of education than the one obtained in 2000, and so may have different labour market experiences than those of the same level in 2000 who did not continue on to further education. Also, graduates who pursued further education, whether they have completed it or not, may not have been in the work force as long as those graduates who did not. Finally, graduates who were enrolled full-time in 2002 may or may not be working or looking for work. Therefore, their outcomes are likely to be affected by this pursuit of education, and not be comparable to those with similar levels of study from the Class of 2000. For these reasons, all those who pursued further education after their 2000 graduation are excluded from the analysis of outcomes in the labour force.

## Section 6: How did graduates fare in the workforce?

This section looks at labour market outcomes of graduates living in Manitoba in 2002 relative to graduates elsewhere. Some graduates in Manitoba did well compared to the national average. Doctoral graduates in Manitoba and male college graduates in Manitoba were more likely to be working and employed full-time in 2002, when compared to their counterparts from all Canadian institutions. Otherwise, the labour market activity of Manitoban graduates was typical of other Canadian graduates.

While employment levels in Manitoba were typical of Canadian graduates overall, earnings<sup>8</sup> were not. With the exception of graduates from the master level, earnings for graduates living in Manitoba in 2002 were lower than those of the average Canadian graduate. There were few differences in earnings between male and female graduates working in the province in 2002 with one exception: male graduates at the college level had higher earnings than their female counterparts. Female graduates at the university level working full-time in Manitoba in 2002 had earnings similar to those of female graduates from Canadian institutions overall.

By 2002, there were 6,400 graduates from the Class of 2000 working in Manitoba, 89% of whom had graduated from the province's colleges and universities. The majority of graduates from Canadian institutions were working in 2002, as were those living in Manitoba. This held true for all levels of study and for both women and men. At least 88% of all graduates in each group were employed (see Table 6 and Table A-5).

### **Doctoral graduates living in Manitoba in 2002 were more likely to be employed and working full-time than the Canadian average.**

While the majority of graduates were employed, doctoral graduates living in Manitoba in 2002 were more likely to be employed than national graduates from all Canadian institutions. This was true for both male and female doctoral graduates. Furthermore, both male and female doctoral graduates in Manitoba in 2002 were more likely to be employed full-time.

Graduates at the bachelor and the master level in Manitoba in 2002 were as likely to be employed as their counterparts nationally and as likely to be working full-time. This held true for both male and female graduates at these levels. Overall, college graduates in Manitoba fared as well in the labour market as their national counterparts, but male graduates in Manitoba fared better, as they were more likely to be employed in 2002, as well as working full-time (see Table 6).

**Table 6**  
**Employment of 2000 graduates in 2002 by gender and level of study**

|                      | Manitoba – 2000<br>province of residence | All graduates<br>% |
|----------------------|--|--------------------|
| <b>College</b>       |  |                    |
| <b>All graduates</b> |  |                    |
| Employed             | 91                                       | 90                 |
| Employed full-time   | 82                                       | 81                 |
| <b>Male</b>          |  |                    |

| Employed full-time   | 90                                       | 76                 |

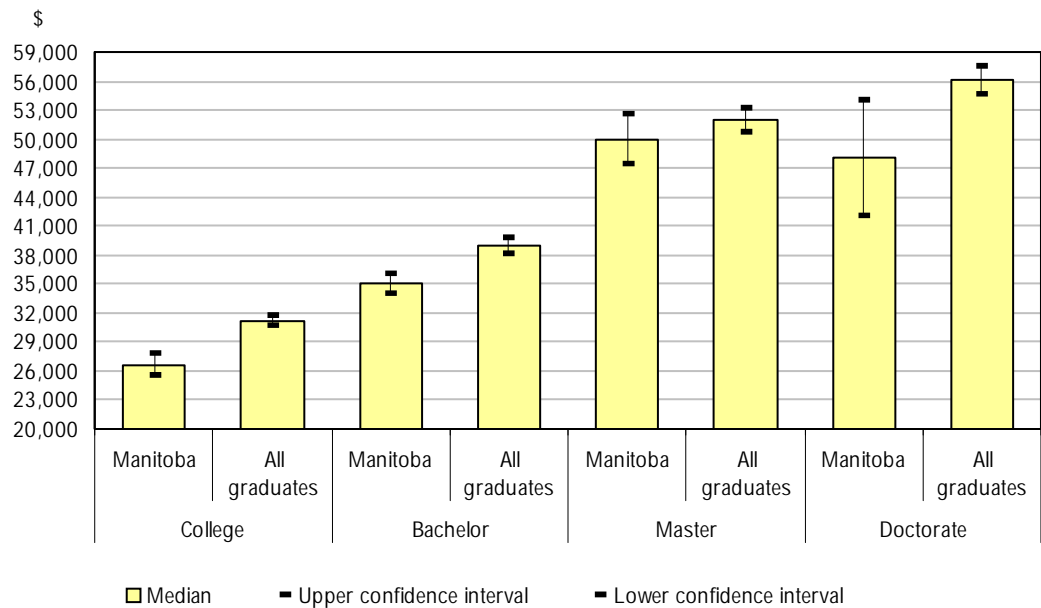

**Notes:** Graduates who pursued further education after their 2000 graduation are excluded from this table, as are graduates for whom a labour force status could not be calculated.

Caution is advised when comparing estimates. High sampling variability errors for some estimates means that many apparent differences are not statistically significant. When differences are significant, they are generally noted in the text.

### With the exception of the master level, graduates earned less in Manitoba.

Overall, graduates at the national level tended to earn more than graduates living in Manitoba<sup>9</sup>. This was most striking at the doctoral level. While doctoral graduates in Manitoba were more likely to be employed and working full-time, the difference in earnings between those working in Manitoba in 2002 and those from the entire Class of 2000 was the largest (see Figure 5 and Table A-6).

**Figure 5**  
**Estimated gross annual earnings of 2000 graduates working full-time in 2002, by level of study**

**Note:** The bar indicates median earnings and the dashes indicate the 95% confidence interval around the median.

### Median earnings of full-time workers

Information on earnings is for graduates working full-time who have not pursued or completed any further education. Earnings information is calculated from the salaries and wages of graduates who were working full-time (30 hours or more) in the week prior to the survey and assumes that they worked for the entire year.

The analysis of earnings uses medians and quartiles to present the typical earnings of graduates. "Median earnings" is the amount which divides the top earning graduates (50%) from the lower earning graduates (50%). In order to present a measure of the range of earnings, quartiles are presented. The range between the bottom and top quartile represents the range of earnings of the "middle-earning" half of graduates. A quarter of graduates had earnings below the bottom quartile threshold and another quarter of graduates earn more than the top quartile threshold.

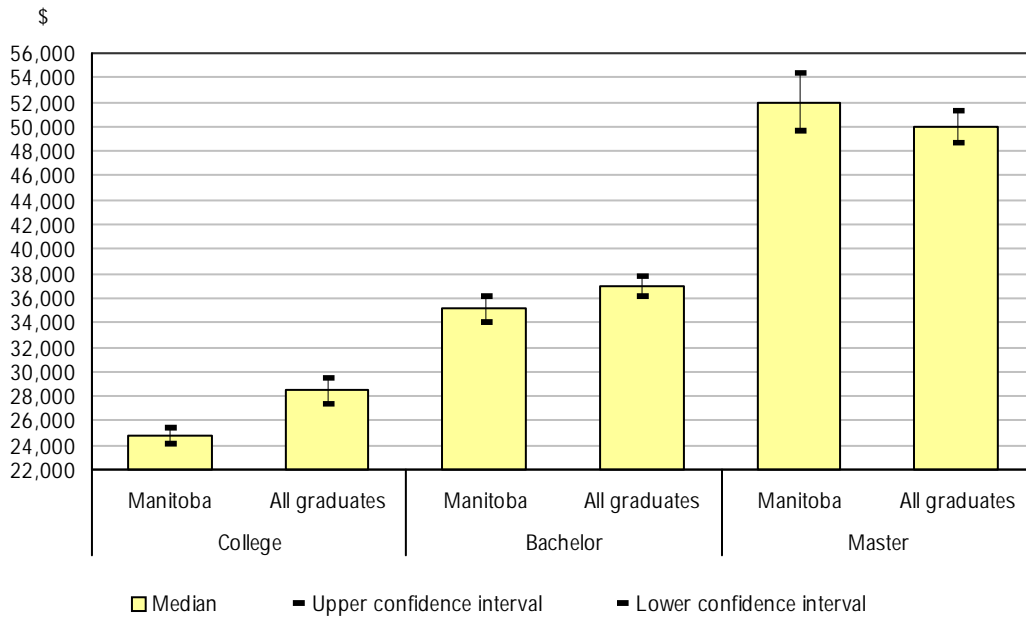

### Female bachelor and master graduates in Manitoba had earnings similar to their national counterparts.

In Canada, female graduates from the college, bachelor and master level earned less than their male counterparts<sup>10</sup>, but this was not the case in Manitoba. In fact, only male graduates at the college level had earnings that were statistically significantly higher than their female counterparts.

While overall trends in earnings for graduates in Manitoba tended to show lower earnings when compared to those at the national level, this was not necessarily true for female graduates in the province. While female college graduates in Manitoba earned less than their national counterparts, earnings for female bachelor and master graduates were similar in both groups (see Figure 6).

**Figure 6**

**Estimated gross annual earnings of 2000 female graduates working full-time in 2002, by level of study**

**Note:** The bar indicates median earnings and the dashes indicate the 95% confidence interval around the median.

## Section 7: How did graduates finance their studies?

An important issue concerning access to education is the affordability of postsecondary education. This can be examined in part by looking at how studies are financed, how much debt is incurred, as well as how these debts are being repaid.

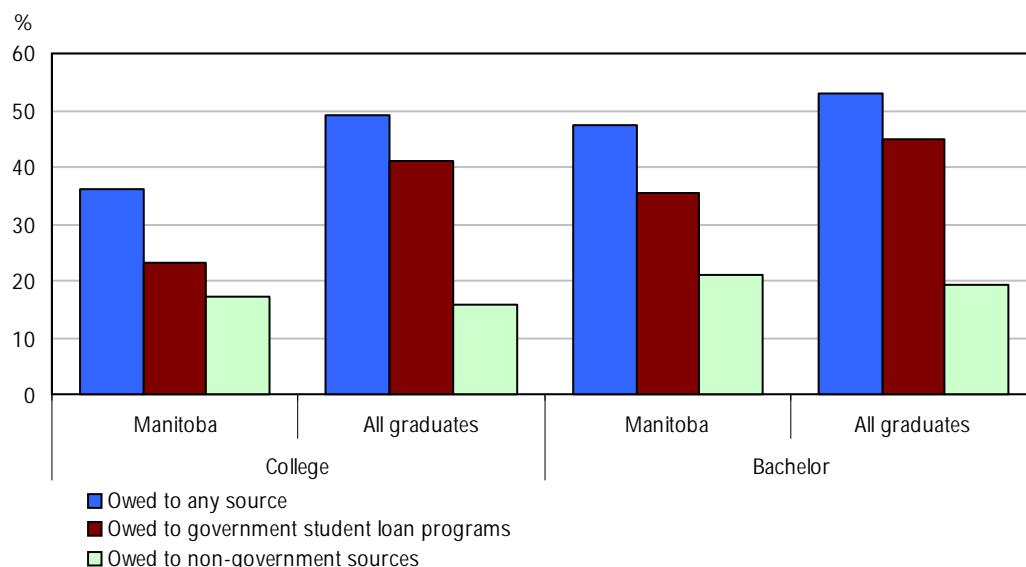

### Information on education-related loans in the National Graduates Survey (Class of 2000)

Graduates were asked if they had ever borrowed money to finance **any** of their education through a government-sponsored student loan program. They were then asked how much they owed for all their government-sponsored student loans at the time of graduation (for all programs). In addition, graduates were asked if they had ever borrowed for their education from other sources that they would have to pay back (such as private bank loans, family, etc). They were then asked how much they owed to these sources at the time of graduation. Because some students may have borrowed and paid off loans from previous postsecondary programs prior to graduating from their most recent program, this analysis focuses only on those graduates who reported an amount owing upon graduation. Moreover, debt was not necessarily incurred during the most recent program pursued, but may have been accumulated from previous studies. Therefore the analysis is also restricted to those graduates who have not pursued any further education and who have thus been required to pay off their loan in the two years since graduation.

Students who pursue postsecondary education may borrow money from a variety of sources in order to finance their education. These sources can be federal, provincial or territorial government student loans or other sources such as a bank loan, line of credit or family.

### Manitoban graduates were less likely to owe money.

College and bachelor graduates from Manitoba were less likely to owe money for their education at the time of their 2000 graduation than Canadian graduates overall. Manitobans were less likely than their Canadian counterparts to owe money to any source and they were also less likely to owe money to student loan programs (see Table A-10). However, they were as likely as graduates from Canadian institutions overall to owe money to non-government sources (see Figure 7).

**Figure 7****Proportion of college and bachelor graduates owing money for their education, by source of financing**

**Note:** Graduates who pursued further education after their 2000 graduation are excluded.

**College graduates in Manitoba generally owed less.**

As well as being less likely to owe money, the debt owed by Manitoban graduates from the college level was below the national average. This was true both for loans owed to any source as well as for loans owed to student loan programs (see Table 7).

**Table 7****Average debt owed at time of graduation, by source of debt and level of study (Class of 2000)**

|   | Manitoba – 2000<br>province of study | All graduates |
|---|--------------------------------------|---------------|
|   | \$                                   |               |
| <b>College</b>  |                                      |               |
| Average debt owed to all sources                      | 10,100                               | 12,700        |
| Average debt owed to government student loan programs | 10,500                               | 12,600        |
| Average debt owed to non-government sources           | 6,500                                | 6,800         |
| <b>Bachelor</b>                                       |                                      |               |
| Average debt owed to all sources                      | 19,100                               | 20,500        |
| Average debt owed to government student loan programs | 18,900                               | 19,500        |
| Average debt owed to non-government sources           | 10,700                               | 10,800        |

**Notes:** Graduates who pursued further education after their 2000 graduation are excluded from this table.

Averages are rounded to the nearest 100, but analysis is carried out on unrounded values.

Caution is advised when comparing estimates. High sampling variability errors for some estimates means that many apparent differences are not statistically significant. When differences are significant, they are generally noted in the text.

### Measures of indebtedness to government student loans by province

Students who obtain government student loans can obtain them either from the federal government, a provincial or territorial government, or both sources. Federal loans are managed in the same way throughout the country, but provincial and territorial loans management differs from jurisdiction to jurisdiction. The system has undergone some changes in recent years, moving to a system of direct government loans, but graduates from the Class of 2000 have borrowed through the older system of government-sponsored bank loans.

The province that lends the money is determined by the province of residence at the time of application. Generally, this is the province where the applicant has most recently lived for twelve consecutive months before the study period, not including time spent as a full-time postsecondary student. However, the National Graduates Survey (NGS) does not collect data on the lending province; it only collects data on residence at certain points in time, such as the principal residence in the twelve months prior to enrolment, the province or territory of the institution for the 2000 program and the principal residence at the time of the 2002 interview. Graduates are extremely mobile, and many have pursued various pathways through postsecondary education. For these reasons, it is not possible to precisely determine from which province or territory the student loans originate. Because each province has its own set of rules in terms of eligibility and limits and the province of comparison may not actually be the province from which student loans were obtained, some variability may exist within a cohort when looking at student loans by province.

To facilitate analysis, the focus of provincial comparison will be on graduates who obtained their 2000 college or bachelor degree, diploma or certificate from an institution in Manitoba. This will focus only on those graduates where the issue of mobility is not as great, such as college and bachelor graduates. However, results for master and doctoral graduates, as well as those living in the province in 2002 are also presented in the tables.

### The increase in student loan amounts was higher for bachelor graduates.

At both the provincial and the national level, student loans owed by bachelor graduates were higher for the Class of 2000 than for the Class of 1995. Increases in student loan amounts between the Class of 1995 and the Class of 2000 for college graduates in Manitoba were not statistically significant, but they were at the national level (see Figure 8 and Table A-7).

**Figure 8**  
**Average amount of government student debt at time of graduation**  
**(\$ constant 2000), Class of 1995 and Class of 2000**

**Note:** The bar indicates the average government student debt and the dashes indicate the 95% confidence interval around the average.

## Section 8: How much debt did graduates repay by 2002?

The ability to pay off debt is influenced by a number of factors, not the least being the level of income. College graduates' debt in Manitoba was lower, but they also earned less. Therefore, their ability to pay off debt may have been affected. An examination of debt-servicing ratios, however, can help evaluate the relationship of loans to income.

### Interpretation of debt-servicing ratios

Debt-servicing ratios are a measure of debt payments as a proportion of income. Debt-servicing ratios are a function of both payment size and income and are therefore only rough indicators of the ability to pay. In some cases they are high because payments are high (often more than the required minimum payment). In other cases they are high because income is low.

To put these values in context, there are a variety of similar measures used by creditors (including student loan programs) to identify possible debt burden. For example, American studies on student loan debt burden often use a benchmark of 8% as the threshold beyond which student debt becomes difficult to manage. The 8% threshold is cited by a variety of American sources on student debt. See, for example, the National Association of Student Financial Aid Administrators (NASFAA), Scherschel (2000), and Choy (2000).

In Canada, the debt-servicing ratios in the Canadian Student Loan Program (CSLP) interest relief program vary depending on the size of the monthly loan repayment, household income and family size. To be eligible for interest relief, the borrower may revise the terms of payment to reflect a 15-year amortization period. For example, a \$20,000 debt will require a monthly payment of approximately \$185. Based on the interest relief table, this payment is approximately 10% of the monthly income for a single person or about 6.5% for a family of two or 5% for a family of three.

In spite of their lower debts, college graduates from Manitoba had slightly higher debt-servicing ratios than graduates from all Canadian institutions. The typical ratio was 8% for graduates from Manitoba, compared with 6% for graduates from Canadian institutions. College graduates in Manitoba therefore seemed to be making larger payments on their government student loans in relation to their earnings. It is not known whether these payments were made by choice or by obligation.

While college graduates in Manitoba had higher debt-servicing ratios, they were no more likely than graduates from all Canadian institutions to indicate difficulty in making their payments. Nearly three out of ten college graduates in both Manitoba and in Canada reported difficulties in repaying their student loans. There were no statistical differences between the province and the nation for bachelor graduates, either in the amount owed, the debt-servicing ratio or in the reported difficulties.

### Calculation of debt repayment

All debt values are provided in current dollars as reported by respondents. No conversion is made to constant dollars. This is because the use of constant dollar values for calculating debt repayment tends to overstate the amount of debt repaid. The value of the debt remains constant over time and is therefore always in "current" dollars.

Consider, for example, a respondent who owes \$1,000 upon graduation and reports remaining debt of \$1,000 two years later; that is, a respondent who has not paid off any of his/her debt. If these values were converted to constant dollars of the graduating year, using say a 3% inflation rate, the remaining debt would be converted to \$943. While the respondent has, in reality, paid off none of his debt, a 0% repayment, a repayment calculation based on constant dollars would make it appear that he has paid off about 5% of his debt.

Constant dollars are used, however, for the comparison of amounts owed at graduation for 1995 and 2000 graduates. For comparison of debts between cohorts, debt at graduation (1995) is converted from 1995 to 2000 constant dollars.

### Manitoba graduates paid off their government student loans at the same rate.

By two years after graduation, graduates in Manitoba had paid off a similar proportion of their graduate student loan as had all Canadian graduates. Although they had smaller debts, they were essentially paying it off at the same rate as the rest.

Graduates from Canadian institutions overall who managed to pay off their student loan debt two years after graduation started out with lower debts than those with debt remaining and fewer started out with debts of \$25,000 or more. They also had higher incomes after graduation and fewer reported having children. College graduates were more likely to be employed in 2002 (although no employment difference was noted at the bachelor level) and were less likely to be in a partnered relationship (see Table A-8).

In Manitoba, there were similar differences between graduates who paid off their debt and those who still owed, but the parallel is not complete. Graduates in Manitoba who managed to pay off their student loan debt also started out with lower debts, were less likely to have debts of \$25,000 or more and had higher incomes. However, in contrast to the national trend, they were equally as likely to have children as graduates who had not managed to pay off their student loan debt. In addition, Manitoban college graduates who owed money in 2002 were as likely to be employed as those who paid them off. Therefore, in Manitoba, the ability of college graduates to pay off student loans was not clearly linked to employment (see Table A-8).

### **More graduates paid off other sources of education financing.**

By the time of the 2002 interview, there were about twice as many graduates who paid off their debt to non-government sources than there were who had paid off their government student loans (approximately 40% compared with 20%). This was true for both graduates from Manitoba and all Canadian graduates. In addition, the amount of debt owed to non-government sources was considerably lower than the amount owed to government student loans, which may be the reason why debt to non-government sources was paid off more quickly. It should also be noted that these sources are varied and may include private bank loans as well as family loans. Information on how these debts are repaid (i.e. interest rates and amortization periods) or whether these debts were forgiven (i.e. family loans) is not available (see Table A-10).

## Section 9: How did Aboriginal graduates fare?

The Council on Post-Secondary Education (COPSE) in Manitoba has developed specific strategies to overcome barriers to postsecondary education for Aboriginal people in the province. This section provides an overview of the profile of Aboriginal graduates and their outcomes in the workforce.

Aboriginal people in Manitoba make up an important part of the province's population. According to the 2001 Census, 13.6% of all Manitobans reported Aboriginal identity compared with 3.3% of all Canadians. For Canada as a whole, Aboriginal graduates from the Class of 2000 represented 3% of all graduates. In 2002, an estimated 900 graduates living in Manitoba reported an Aboriginal identity, representing 12% of all graduates from the Class of 2000 living in Manitoba at the time.

The majority (six out of ten) of college and bachelor graduates living in Manitoba in 2002, whether Aboriginal or not, were women. Aboriginal graduates had an even greater share of women at the bachelor level, when compared to their non-Aboriginal counterparts in the province. Women accounted for over 80% of all Aboriginal bachelor graduates, compared with 60% for non-Aboriginal graduates (see Table A-11).

### College was the level of choice for Aboriginal graduates.

Aboriginal graduates in Manitoba accounted for 17% of college-level graduates in the province and 9% of Manitoban graduates at the bachelor level. The proportion of college graduates with Aboriginal identity roughly reflected the proportion of Aboriginal people in the general population in Manitoba. In contrast, Aboriginal people were under-represented at the bachelor level.

Aboriginal graduates living in Manitoba in 2002 chose fields of study that differed from their non-Aboriginal counterparts. This was true at both the college and at the bachelor level. At the college level, Aboriginal graduates were more likely to study in Health, Parks, Recreation and Fitness, and less likely to study in Engineering Technologies. More than one-third of Aboriginal graduates studied in Health, Parks, Recreation and Fitness, compared with a quarter of non-Aboriginal graduates. A little more than two non-Aboriginal college graduates in ten studied in Engineering Technologies, compared with only one in ten Aboriginal college graduates. At the bachelor level, about half of Aboriginal bachelor graduates studied in Social Sciences and Law (of which more than four out of ten specialized in Child Care and Support Services Management), compared with 20% of non-Aboriginal graduates.

### **Aboriginal graduates tended to delay entry into postsecondary.**

Aboriginal graduates were less likely than non-Aboriginal graduates to have entered their program directly from secondary school. This was true for graduates at both the college and bachelor level, but college Aboriginal graduates were the least likely to have moved to postsecondary education directly from secondary school. About 17% of Manitoban Aboriginal graduates had gone on to college directly from secondary school, compared with 25% of non-Aboriginal graduates. At the bachelor level, about 30% of Aboriginal graduates were enrolled in secondary school in the twelve months prior to enrolment in their 2000 program, compared with nearly 60% of non-Aboriginal graduates.

Not only did college Aboriginal graduates delay entry into postsecondary, they were also less likely to have pursued a postsecondary program prior to the one completed in 2000. About 20% of college Aboriginal graduates had previous postsecondary experience, compared with about 30% of their non-Aboriginal counterparts. About 20% in both groups pursued further education after the 2000 program (see Table A-11).

### **Aboriginal graduates were older, and at the bachelor level, less likely to be single and more likely to have children.**

Because they were more likely to delay their entry into postsecondary education, it is not surprising that Aboriginal graduates living in Manitoba were older than their non-Aboriginal counterparts. At the college level, only 24% of Aboriginal graduates were under age of 25, compared with 61% of their non-Aboriginal counterparts. At the bachelor level, 38% of Aboriginal graduates were under age 25, compared with 67% of non-Aboriginal bachelor graduates. These results were particularly interesting given that the average age of the Aboriginal population in Manitoba is much lower than the non-Aboriginal population.

Perhaps because they were older, there were also greater proportions of Aboriginal graduates at the bachelor level living with a partner or having dependent children. Overall, slightly less than half of Aboriginal graduates lived with a partner. In comparison, about a third of non-Aboriginal graduates living in Manitoba lived with a partner. More than half of Aboriginal graduates living in Manitoba had dependent children, compared with only about a quarter of non-Aboriginal college graduates and 14% of non-Aboriginal bachelor graduates living in Manitoba (see Table A-11).

### **Aboriginal college graduates in Manitoba were twice as likely as those outside the province to have an Aboriginal language as a mother tongue.**

While English continued to be the most common mother tongue, the use of Aboriginal languages among recent graduates was more prominent in Manitoba than outside the province. When compared to Aboriginal college graduates living outside of Manitoba, Aboriginal graduates living in the province were about twice as likely to report an Aboriginal language as their mother tongue (see Table 8). Differences for bachelor graduates were not statistically significant.

**Table 8****Mother tongue of Class of 2000 Aboriginal college and bachelor graduates by 2002 location of residence**

|                 | Aboriginal<br>graduates<br>living in<br>Manitoba –<br>2002 | Aboriginal<br>graduates<br>not living in<br>Manitoba –<br>2002 | Aboriginal<br>graduates<br>not living in<br>Manitoba or in<br>Quebec – 2002 |

\* numbers marked with this symbol have a coefficient of variation between 16.6% and 25% and are less reliable than unmarked numbers

\*\* numbers marked with this symbol have a coefficient of variation greater than 25% and less or equal to 33.3% and are very unreliable

F too unreliable to be published (coefficient of variation surpasses 33.3%)

**Notes:** Proportions may not add up to 100 due to multiple responses.

Caution is advised when comparing estimates. High sampling variability errors for some estimates means that many apparent differences are not statistically significant. When differences are significant, they are generally noted in the text.

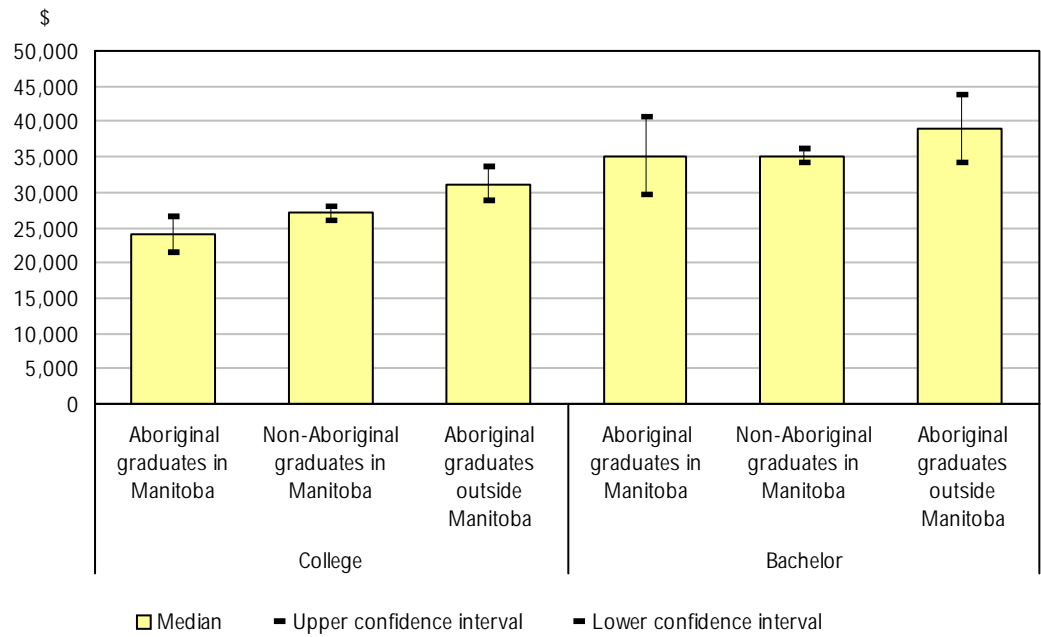

### Aboriginal college graduates in Manitoba were less likely to be employed and had lower earnings.

Aboriginal bachelor graduates in Manitoba had similar employment levels to those of non-Aboriginal graduates in the province. At least nine out of ten graduates in each group were employed in 2002.

When compared to their non-Aboriginal counterparts in the province, the employment level was slightly lower among Aboriginal college graduates in Manitoba. About 80% of Aboriginal college graduates were employed in Manitoba in 2002, compared with more than 90% of their non-Aboriginal counterparts and 85% of Aboriginal college graduates living outside the province (see Table A-12).

As was the case for Manitoba graduates overall, Aboriginal graduates outside the province of Manitoba earned more than Aboriginal graduates within the province. Within Manitoba, Aboriginal graduates had similar levels of earnings compared to their non-Aboriginal counterparts. This was true for both college and bachelor graduates (see Figure 9 and Table A-13).

**Figure 9**  
**Estimated gross annual earnings of college and bachelor 2000 graduates working full-time in 2002, by Aboriginal status**

**Note:** The bar indicates median earnings and the dashes indicate the 95% confidence interval around the median.

## Conclusion

Graduates from the province of Manitoba shared many characteristics with graduates from all Canadian institutions. However, there were a few notable differences. In comparison with Canadian graduates overall, graduates from Manitoba were more likely to be of Aboriginal origin, but were less diverse than graduates from the Class of 2000 in terms of visible minorities, citizenship and mother tongue. Graduates from Manitoba were also more likely than graduates from all Canadian institutions to have completed a bachelor degree. They generally took longer to complete their program and college graduates in Manitoba were more likely to delay entry into postsecondary education.

While the majority of Manitoba residents from the Class of 2000 did not leave the province, Manitoba lost more students and graduates than it gained during the period from before their program began to two years after graduation, particularly at the bachelor and master level. Mobility was linked to the pursuit of education. Manitoba attracted a number of bachelor graduates from the Class of 2000 who, although they obtained their degree elsewhere, chose the province to pursue additional postsecondary studies. While there was a loss of students and graduates from bachelor and master levels, it is possible that some of this loss is short-term. It will be possible to see in the Follow-up Survey of Graduates (FOG) whether those who left the province to study elsewhere return to Manitoba once their studies are completed.

While employment levels in Manitoba were typical of Canadian graduates overall, earnings were not. With the exception of graduates from the master level, earnings for graduates living in Manitoba in 2002 were lower than those of the average Canadian graduate. However, there were few differences in earnings between male and female graduates working in the province in 2002. Only male graduates at the college level had higher earnings than their female counterparts. In addition, female graduates at the university level working full-time in Manitoba in 2002 had similar earnings to those of female graduates from Canadian institutions overall.

College and bachelor graduates in Manitoba were less likely to have incurred a debt during their studies. The debt incurred by college graduates in Manitoba was lower than that of college graduate from Canadian institutions, but the ratio of their debt repayment to their income was higher. However, they were no more likely than college graduates from all Canadian institutions to report difficulties in repaying their loans.

Debts to other loans were paid off more quickly than debts to student loans: by 2002, about twice as many graduates completely paid off their debts to other loans. This was true for both graduates from Manitoba and all graduates from Canadian institutions.

Aboriginal graduates in Manitoba were generally more likely to have obtained a college diploma, and this proportion roughly reflected the proportion of Aboriginal people in the general population. In contrast, Aboriginal people were under-represented at the bachelor level, and had lower representation at higher levels of study. As well, the fields of study chosen by both Aboriginal college and bachelor graduates differed from those of their non-Aboriginal counterparts in the province. Aboriginal college graduates were less likely to be employed and, compared with their Aboriginal counterparts outside the province, their earnings were lower.

This analysis looked at the activities of Manitoban graduates two years after graduation (in 2002). These graduates will be interviewed again in 2005. This follow-up survey will provide a more complete picture of the transition from education to stable employment.

## Endnotes

1. Graduates who were living outside of Canada and the United States at the time of the 2002 interview were not part of the scope of the survey; therefore, the only foreign-born graduates who were interviewed were those who were living in Canada or in the United States at the time of the 2002 interview.
2. On July 1, 2004, one of the colleges became a university college.
3. Graduates were asked to give the month and year when they started their program, as well as the month and year when they completed all the requirements for their program. The length of time taken to complete postsecondary studies is calculated using the number of months between the start date of the program and the end date of the program for full-time students only.
4. For example, full-time studies may be defined as pursuing three courses, while a full load is pursuing five courses.
5. Allen, Harris and Butlin, 2003.
6. Zeman, Knighton and Bussière, 2004.
7. The difference between graduates at the master and doctoral levels was not statistically significant.
8. Annual earnings are estimated based on values reported on questions on number of hours of work per week, number of days per week worked and the easiest way to report earnings (hourly, weekly, annually, etc). For example, gross annual earnings are estimated by multiplying hourly salaries by the number of hours worked per week, then by 52, for the number of weeks in a year.
9. The difference in earnings at the master level between graduates living in Manitoba and all graduates was not statistically different.
10. The difference in earnings between male and female doctoral graduates at the national level was not statistically different.

## Appendix A: Data tables

The enclosed tables are based on the National Graduates Survey (Class of 2000).

### Symbols and abbreviations

- ... not applicable
- x suppressed to meet confidentiality requirements of the *Statistics Act*
- \* numbers marked with this symbol have a coefficient of variation between 16.6% and 25% and are less reliable than unmarked numbers.
- \*\* numbers marked with this symbol have a coefficient of variation greater than 25% and less or equal to 33.3% and are very unreliable
- F too unreliable to be published (coefficient of variation surpasses 33.3%)

Coefficients of variation (CV) provide a measure of the reliability of the estimate, taking into account sampling variability. In order to estimate whether two values are statistically significantly different, the following formula can be applied to approximate a 95% confidence interval:

$$Y \pm 2 (CV \times Y)/100, \text{ where } Y \text{ is the estimate}$$

This approximate confidence interval gives a range within which the true value in the population is likely to fall. If two confidence intervals do not overlap, then there is a significant statistical difference between the two estimates. It should be noted that this formula is approximate because it estimates a confidence interval that is slightly higher than the 95% level of confidence. As a result, there is a small risk that a significant difference will be identified as insignificant.

For example, with a coefficient of variation of 16%, an estimate such as “30% of graduates” would be accurate  $\pm 9.6\%$ , 95 times out of 100 [ $\pm 2 (16 \times 30)/100$ ]. With a coefficient of variation of 33%, this estimate would be accurate  $\pm 19.8\%$ , 95 times out of 100 [ $\pm 2 (33 \times 30)/100$ ].

1. Student mobility is defined as a percentage of students residing in the province before enrolling.
2. Graduate mobility is defined as a percentage of graduates residing in the province at graduation.
3. Overall mobility is defined as the difference between the number of graduates two years after graduation and the number of students before enrolling, as a percentage of the number of students residing in the province before enrolling.

**Notes:** Numbers are rounded to the nearest 10, but analysis is carried out on unrounded numbers.

Caution is advised when comparing estimates. High sampling variability errors for some estimates means that many apparent differences are not statistically significant. When differences are significant, they are generally noted in the text.

**Notes:** This table includes only graduates who have ever lived in Manitoba, either prior to enrolling to their studies, during their studies or at the time of the 2002 interview.

Caution is advised when comparing estimates. High sampling variability errors for some estimates means that many apparent differences are not statistically significant. When differences are significant, they are generally noted in the text.

| Unemployment rate                 | x  | x  | 8             |

**Notes:** The sum of full-time employed and part-time employed may not add up to total employed because data on hours worked are not always reported.

Graduates who pursued further education after their 2000 graduation are excluded from this table, as are graduates for whom a labour force status could not be calculated.

The unemployment rate is the percentage unemployed out of the total of employed and unemployed.

Numbers of graduates are rounded to the nearest 100. Totals may not add up due to rounding.

Caution is advised when comparing estimates. High sampling variability errors for some estimates means that many apparent differences are not statistically significant. When differences are significant, they are generally noted in the text.

**Notes:** Graduates who pursued further education after their 2000 graduation are excluded from this table.

Averages and numbers are rounded to the nearest 100, but analysis is carried out on unrounded values.

Caution is advised when comparing estimates. High sampling variability errors for some estimates means that many apparent differences are not statistically significant. When differences are significant, they are generally noted in the text.

| With previous postsecondary education (%)                     | x  | x  | 99            |

**Notes:** Graduates who pursued further education after their 2000 graduation are excluded from this table.

Averages and numbers are rounded to the nearest 100, but analysis is carried out on unrounded values.

Caution is advised when comparing estimates. High sampling variability errors for some estimates means that many apparent differences are not statistically significant. When differences are significant, they are generally noted in the text.

| Average debt owed to both sources at time of graduation (\$)  | 15,000                                     | x  | 42,800        |
| Percentage of graduates with debt who had paid it off two years after graduation                        | x  | x  | 10            |
| Average debt remaining two years after graduation for those who still owed (\$)                         | x  | x  | 38,800        |

**Notes:** Graduates who pursued further education after their 2000 graduation are excluded from this table.

Averages and numbers are rounded to the nearest 100, but analysis is carried out on unrounded values.

Caution is advised when comparing estimates. High sampling variability errors for some estimates means that many apparent differences are not statistically significant. When differences are significant, they are generally noted in the text.

| Employed (%)                      | 100  | 93   | 93   |
| Employed full-time (%)            | 100  | 87   | 88   |
| Employed part-time (%)            | x  | 7*   | x  |
| Out of the labour force (%)       | x  | F  | x  |
| Unemployment rate                 | x  | F  | F  |
| <b>Number of female graduates</b> | <b>200</b>   | <b>1,400</b>   | <b>1,100</b>   |
| Employed (%)                      | 91   | 90   | 90   |
| Employed full-time (%)            | 78   | 80   | 74   |
| Employed part-time (%)            | F  | 10   | F  |
| Out of the labour force (%)       | x  | 5*   | F  |
| Unemployment rate                 | F  | 6*   | F  |

**Notes:** The sum of full-time employed and part-time employed may not add up to total employed because data on hours worked are not always reported.

Graduates who pursued further education after their 2000 graduation are excluded from this table, as are graduates for whom a labour force status could not be calculated.

The unemployment rate is the percentage unemployed out of the total of employed and unemployed.

Numbers of graduates are rounded to the nearest 100.

Caution is advised when comparing estimates. High sampling variability errors for some estimates means that many apparent differences are not statistically significant. When differences are significant, they are generally noted in the text.

**Table A-13****Estimated gross annual earnings of 2000 college and bachelor graduates working full-time in 2002, by Aboriginal status and location of residence**

| Median               | 35,100   | 35,100   | 39,000   |
| 75th percentile      | 40,600   | 43,000   | 48,000   |
| <b>Male</b>          |  |  |  |
| 25th percentile      | 35,100   | 27,000   | 30,000   |
| Median               | 38,000   | 35,000   | 36,000   |
| 75th percentile      | 40,800   | 43,700   | 49,400   |
| <b>Female</b>        |  |  |  |
| 25th percentile      | 25,000   | 27,300   | 33,800   |
| Median               | 32,000   | 35,900   | 40,000   |
| 75th percentile      | 40,000   | 42,000   | 45,800   |

**Notes:** Graduates who pursued further education after their 2000 graduation are excluded from this table.

All numbers are rounded to the nearest 100, but analysis is carried out on unrounded values.

Caution is advised when comparing estimates. High sampling variability errors for some estimates means that many apparent differences are not statistically significant. When differences are significant, they are generally noted in the text.

## Appendix B: Methodology

### Objectives

The 2002 National Graduates Survey (Class of 2000), (NGS2000), seeks to profile the transition of 2000 postsecondary graduates from school to the labour market and their acquisition of their first work experience. The 2000 version of the survey follows on past surveys of graduates, conducted approximately every five years since the early 1980s.

### Target population

The population of interest for NGS2000 consists of all persons graduating from a recognized Canadian postsecondary institution who completed an eligible program or obtained their diploma during the 2000 calendar year.

These include:

- any graduate of a university program leading to a bachelor, master or doctoral degree or a specialized certificate or diploma;
- any graduate of a postsecondary program (i.e., a program of one year's duration or longer which normally requires secondary school completion or its equivalent for admission) offered by a college of applied arts and technology (CAAT), *Collège d'enseignement général et professionnel* (CEGEP), a community college, a technical school or a similar institution;
- any graduate of skilled trades (i.e., graduate of a pre-employment program usually of three months' duration or longer). A vocational or trade school is a public educational institution that offers courses to prepare for employment in a given trade, such as that of a heavy machine operator, an automobile mechanic or an upholsterer. Many community colleges and technical institutions offer trade certificates or diplomas.

The survey excludes:

- graduates of private postsecondary educational institutions (i.e., computer training schools or commercial secretarial schools);
- persons who completed continuing education courses at a university or college (unless these led to a degree or diploma);
- individuals who took part-time trade courses (e.g., adult education evening courses) while employed full-time;
- persons who completed vocational training programs lasting less than three months or programs not offered in the skilled trades (e.g., basic training or skill development programs) and
- persons in apprenticeship programs.

## Survey methodology

The sampling frame of NGS2000 was constructed from lists of graduates, supplied by participating institutions in response to information requests that Statistics Canada sent them in order to cover the target population. The sampling frame includes nearly 315,000 graduates.

The sampling plan for NGS2000 is based on a stratification of the graduate population by province of institution, education level and major field of study. The province of institution can be any of Canada's ten provinces or three territories. Education levels include five classes: trade/vocational training, college, bachelor degree or its equivalent, master degree or its equivalent, and doctorate or its equivalent. Major fields of study, which number either eight or nine depending on the education level, group together study programs according to the associated codes, based on the Classification of Instructional Programs.

The sample was distributed among the strata in such a way as to meet analytical needs. The resulting sampling ratios per stratum are fairly high. They range between 20% and 100% in some cases, such as for holders of a doctorate or its equivalent. A random selection of graduates within each stratum was then carried out to obtain a representative sample large enough to meet the main needs of the survey.

The information required from the approximately 60,000 graduates in the sample was collected by computer assisted telephone interviewing during the summer of 2002. The information collected then underwent extensive validation to determine its consistency.

## Data quality and limitations on scope of data

The figures presented in this report are estimates based on the information collected from NGS2000 respondents. As in any statistical survey process, the NGS2000 estimates contain two types of error: sampling error and non-sampling error.

The sampling error of an estimate results from the random composition of the sample, which never yields exactly the estimate that would be obtained if the data were collected from the entire population. The magnitude of the sampling error may be evaluated and measured, and this report provides such measurements for each of the estimates based on the data collected from the sample of graduates for NGS2000.

If the sampling error measurement for an estimate exceeds 33%, then the estimate is not considered sufficiently reliable to be released. An estimate with an associated measurement that lies between 16.5% and 33% must be used with caution, since its reliability does not allow for firm conclusions.

All types of error other than that resulting from the random composition of the sample are known as non-sampling errors. In general, these types of error are difficult to detect or measure adequately, and it is also hard to mitigate their effects when developing estimates.

The unweighted response rate for NGS2000 was approximately 70%. This rate is not uniform, differing notably from one province to another and from one education level to another. To mitigate the effects of non-response, adjustments

were made to the data collected, and these adjustments affect the variability of the estimates calculated.

In the sampling frame of NGS2000, graduates of colleges in southern Alberta are undercovered. Unlike with non-response, the undercoverage of this group cannot be offset by a reweighting adjustment. This is because the characteristics relating to graduates in this part of Alberta may reasonably be thought to differ considerably from those of Alberta graduates for whom the coverage is appropriate, and therefore a reweighting of the graduates covered would only introduce a bias in the estimate of the characteristics of graduates from colleges in southern Alberta.

## Appendix C: Aboriginal languages

The following codes were used to determine Aboriginal languages:

|     |                              |     |                            |
|-----|------------------------------|-----|----------------------------|
| 116 | Cree                         | 149 | Bella Coola                |
| 117 | Ojibway                      | 150 | Comox                      |
| 118 | Blackfoot                    | 151 | Halkomelem                 |
| 119 | Malecite                     | 152 | Lillooet                   |
| 120 | Micmac                       | 153 | Okanagan                   |
| 121 | Montagnais-Naskapi           | 154 | Sechelt                    |
| 122 | Delaware                     | 155 | Shuswap                    |
| 123 | Abenaki                      | 156 | Squamish                   |
| 124 | Potawatomi                   | 157 | Thompson (Ntlakapamux)     |
| 125 | Algonquin                    | 158 | Other Salish languages     |
| 126 | Other Algonquian languages   | 159 | Tsimshian                  |
| 127 | Chipewyan                    | 160 | Gitksan                    |
| 128 | South Slavey language        | 161 | Haisla                     |
| 129 | Carrier                      | 162 | Heiltsuk                   |
| 130 | Sarcee                       | 163 | Kwakiutl                   |
| 131 | Beaver                       | 164 | Nootka (Nuu-Chah-Nulth)    |
| 132 | Tagish                       | 165 | Other Wakashan languages   |
| 133 | Sekani                       | 166 | Haida                      |
| 134 | Chilcotin                    | 167 | Dakota (Sioux)             |
| 135 | Dogrib                       | 168 | Tlingit                    |
| 136 | North-slavey language (Hare) | 169 | Chillok                    |
| 137 | Kutchin-Gwich'in (Loucheux)  | 170 | Kutenai                    |
| 138 | Kaska-Nahani                 | 171 | Other Aboriginal languages |
| 139 | Tahltan                      | 172 | Inuktitut (Eskimo)         |
| 140 | Tutchone                     | 185 | Attikamekw                 |
| 141 | Other Athapaskan languages   | 188 | Mitchif                    |
| 142 | Mohawk                       | 189 | Oji-Cree                   |
| 143 | Cayuga                       | 190 | Dene                       |
| 144 | Oneida                       | 191 | Han                        |
| 145 | Onondaga                     | 192 | Straits Salish             |
| 146 | Seneca                       | 193 | Nishga                     |
| 147 | Tuscarora                    | 194 | Assiniboin                 |
| 148 | Other Iroquoian languages    | 195 | Stoney                     |

# Culture, Tourism and the Centre for Education Statistics Research Papers Cumulative Index

Statistics Canada's **Division of Culture, Tourism and the Centre for Education Statistics** develops surveys, provides statistics and conducts research and analysis relevant to current issues in its three areas of responsibility.

The **Culture Statistics Program** creates and disseminates timely and comprehensive information on the culture sector in Canada. The program manages a dozen regular census surveys and databanks to produce data that support policy decision and program management requirements. Issues include the economic impact of culture, the consumption of culture goods and services, government, personal and corporate spending on culture, the culture labour market, and international trade of culture goods and services. Its analytical output appears in the flagship publication *Focus on Culture* ([www.statcan.ca/english/IPS/Data/87-004-XIE.htm](http://www.statcan.ca/english/IPS/Data/87-004-XIE.htm)) and in *Arts, culture and recreation – Research papers*.

The **Tourism Statistics Program** provides information on domestic and international tourism. The program covers the Canadian Travel Survey and the International Travel Survey. Together, these surveys shed light on the volume and characteristics of trips and travellers to, from and within Canada. Its analytical output appears in the flagship publication *Travel-log* ([www.statcan.ca/english/IPS/Data/87-003-XIE.htm](http://www.statcan.ca/english/IPS/Data/87-003-XIE.htm)) and in *Travel and tourism – Research papers*.

The **Centre for Education Statistics** develops and delivers a comprehensive program of pan-Canadian education statistics and analysis in order to support policy decisions and program management, and to ensure that accurate and relevant information concerning education is available to the Canadian public and to other educational stakeholders. The Centre conducts fifteen institutional and over ten household education surveys. Its analytical output appears in the flagship publication *Education quarterly review* ([www.statcan.ca/english/IPS/Data/81-003-XIE.htm](http://www.statcan.ca/english/IPS/Data/81-003-XIE.htm)), in various monographs and in *Education, skills and learning – Research papers* ([www.statcan.ca/english/IPS/Data/81-595-MIE.htm](http://www.statcan.ca/english/IPS/Data/81-595-MIE.htm)).
