## The System of National Accounts

---

In Canada, the National Accounts have been developed since the close of the Second World War in a series of publications relating to their constituent parts. These have now reached a stage of evolution where they can be termed a "System of National Accounts". For purposes of identification, all publications (containing tables of statistics, descriptions of conceptual frameworks and descriptions of sources and methods) which make up this System carry the term "System of National Accounts" as a general title.

The System of National Accounts in Canada consists of several parts. The annual and quarterly Income and Expenditure Accounts (included with Catalogue Nos. carrying the prefix 13) were, historically speaking, the first set of statistics to be referred to with the title "National Accounts" (National Accounts, Income and Expenditure). The Balance of International Payments data (Catalogue Nos. with prefix 67), are also part of the System of National Accounts and they, in fact, pre-date the Income and Expenditure Accounts.

Greatly expanded structural detail on industries and on goods and services is portrayed in the Input-Output Tables of the System (Catalogue Nos. with prefix 15). The Catalogue Nos. carrying the prefix 15 also provide measures of the contribution of each industry to total Gross Domestic Product at factor cost as well as Productivity Measures.

Both the Input-Output tables and the estimates of Gross Domestic Product by Industry use the establishment as the primary unit of industrial production. Measures of financial transactions are provided by the Financial Flow Accounts (Catalogue Nos. with prefix 13). Types of lenders and financial instruments are the primary detail in these statistics and the legal entity is the main unit of classification of transactors. Balance sheets of outstanding assets and liabilities are published annually.

The System of National Accounts provides an overall conceptually integrated framework in which the various parts can be considered as interrelated sub-systems. At present, direct comparisons amongst those parts which use the establishment as the basic unit and those which use the legal entity can be carried out only at highly aggregated levels of data. However, Statistics Canada is continuing research on enterprise company establishment relationships; it may eventually be feasible to reclassify the data which are on one basis (say the establishment basis) to correspond to the units employed on another (the company or the enterprise basis).

In its broad outline, the Canadian System of National Accounts bears a close relationship to the international standard as described in System of National Accounts, 1993, a joint publication of the Commission of the Euro-pean Communities, International Monetary Fund, Organization for Economic Co-operation and development, United Nations and World Bank.

## What's new in this publication

---

This publication is the sixth issue of *Input-Output Structure of the Canadian Economy*, Catalogue 15-201-X in its electronic version. In this free internet publication we suggest selected articles (see Related products) as special studies related to the IO framework. Other noticeable features are:

- **Improved data quality:** Statistics Canada undertook a massive project to improve its provincial economic statistics in 1996. Using sub-national surveys and other improved sources, the reliability of statistics published here is substantially improved and is approximately equal across provinces.
- **Provincial input-output tables:** Beginning with reference year 1997, input-output tables are compiled and published annually in this catalogue for each province and territory of Canada. Sub-national tables sum to the national tables for Canada. The accounting framework and concepts of these tables are identical to the national tables that date back to the 1961 reference year. We also refer in the text to exports and imports between provinces as well as abroad. To have access to the interprovincial trade data please consult CANSIM Table 386-0002.
- **Classifications:** In the present input-output tables, industries are classified by the North American Industry Classification (NAICS 2002)

Classifications by industries, by commodity and by categories of final demand have been simplified to such an extent that all classifications are now presented in hierarchical order. For example, the classifications of final demand give from the detail to the aggregate, the concordances and by the same token the aggregation parameters that permits to pass from the "W" level of final demand categories to the other levels "L", "M" and "S". All classifications of final demand include the interprovincial trade.

- **Valuation of industry GDP:** The valuation of industry gross domestic product has changed from factor cost to basic price, in accordance with conventions recommended by the United Nations report and System of National Accounts, 1993. Under the old valuation, industry gross domestic product was calculated to include the returns to labour and capital only, excluding taxes or production subsidies. The new valuation of industry GDP is basic prices which includes other taxes on production and other subsidies on production. Data on gross output is at modified basic price, because production data show prices actually received by producers thus reflecting the effect of subsidies on products. For this reason, we have made available, at all levels of aggregation of the Input-Output Tables, the breakdown of subsidies into its components: subsidies on products and subsidies on production. This will be more convenient to identify all the components of GDP at basic price and at market price.
- **Refinements to the 1993 SNA conventions:** A number of refinements to the adopted recommendations were implemented affecting the treatment of specific transactions or industries.

## Annual provincial Input-Output tables

With this publication, Statistics Canada is providing input-output (IO) accounts for all provinces and territories of Canada on an annual basis starting with the year 1997. Until recently, annual publication of input-output accounts were limited to the national economy. These accounts are the most comprehensive and detailed statistics on transactions involving production activity and intermediate as well as final consumption of goods and services in the economy. The accounts are prepared at the Worksheet level of detail, consisting of 303 industries, 727 groups of goods and services (commodities), and 172 categories of final users. There are three more compact versions of the tables that are usually available to the public: the Link, the Medium and the Small aggregation tables. The most compact presentation of IO accounts, the Small IO tables, are provided in this publication.

## A quick guide to the IO accounts

### What are Input, Output and Final demand tables

The input-output accounts of Canada and its provinces and territories are presented in three main data tables (matrices) for each jurisdiction. These are the output table, input table, and the final demand table. In addition, provinces' and territories' tables are linked together through an interprovincial flows table that shows each jurisdiction's exports to, and imports from, other provinces and territories as well as abroad. These tables are compiled every year by Statistics Canada using newly instituted surveys and other improved sources that are designed to collect reliable statistics from each jurisdiction. The tables are part of the Canadian System of National Accounts (CSNA). The CSNA is a system of integrated statistical accounts consisting of four components: input-output tables, income and expenditure account (national and provincial), balance of payments and international position, and environment accounts. This system is "integrated" in the sense that all of the data belonging to this system are consistent with one another. IO tables cover all economic activities conducted in the market economies of each province and territory, encompassing persons, businesses, government and non-governmental (non-profit) organizations, and entities outside its jurisdiction that give rise to imports or exports (interprovincially or internationally).

To compile the IO accounts, Input-Output Division obtains source data from all relevant surveys as well as administrative sources such as tax records, professional and industry organizations, and non-government institutions every year for each province and territory. In the process of preparing statistical estimates, data from various sources are confronted, analysed by subject-matter experts and used to compile estimates that are consistent with all other estimates in the System and provide a valid and coherent statistical picture of the subject matter. Consistency is a key feature of the statistics produced by the Accounts. It is highly valuable to the user because data taken from the accounts do not disagree with each other or provide contradictory information. When various data bearing on the same subject do not provide a consistent picture, the user is left in the position of either reconciling inconsistencies without the benefit of necessary information, or discarding the data for lack of realism or credibility. A good example of how consistency is achieved through data integration is a process known as "commodity balancing". Because, logically, the supply of a good or service from all possible sources must equal its demand or disposition in a given jurisdiction, every good and service in the economy is scrutinized to make sure it obeys this rule before it is used for IO compilation. When supply does not add up to demand or disposition (demand plus inventory), as is often the case, each data source is questioned, errors and omissions are corrected, and sometimes the data is re-estimated in light of more reliable information to achieve complete balance between supply and disposition.

## What IO tables show

The tables are set up on a year-by-year basis, rather than in time series. Tables for Canada (the national tables) date back to 1961, while regular sub-national tables began with the 1996 reference year. The tables identify transactions in three ways:

1. they show data by commodity, a neutral terminology for a group of goods or services or type of transactions (e.g., “wages” or “indirect taxes”); The most detailed tables, the Worksheet tables, groups all transactions into 727 commodities. Tables that are published electronically—known as the “Small” tables—compact this detail into 59 commodities.
2. they show data by industry: a group of producing units, such as establishments or enterprises, that are engaged in market transactions in goods or services. The term “industry” does not imply that they are industrial businesses. The terminology covers all entities that conduct activities involving market transactions. The concept includes such groups as Municipal Governments, non-profit institutions such as Sports and Recreation Clubs, and professions such as Offices of Dentists. The Small tables published here show 25 very aggregated industries but, at the most detailed (Worksheet) level, the tables are made up of 303 industries. For the provinces, the territories and for Canada the inputs and the outputs tables show the data for 727 goods and services produced (for the output) or used (for the inputs) for each of the 303 industries;
3. they show data by categories of final demand, a convenient breakdown that identifies transactions that constitute final sales of goods and services.

## The Final demand table

This table shows transactions in goods and services, in a province or territory, that are for *final* use. A transaction is for final use when the good or service is exported, when it is bought for final consumption (i.e., it is not used to produce other goods and services for the market), or as capital investment. While all purchases by households (persons) are considered final consumption in the System, businesses, governments, and other entities make purchases both as intermediate and as final expenditure. Their intermediate expenditures are shown in the Input (or Intermediate Use) table and their final expenditures are shown in the Final Demand table. For instance, when a retail store pays for electricity, it is shown as payment from Retail Trade industry (Input table) and as output for Electric Power industry (Output table). However, when the same store buys payment processing machinery, the payment is shown in the Final Demand table as investment by the Retail Trade industry and also either an output of the relevant Canadian industry, as an import, or as a withdrawal from inventories of the particular machinery. Imports are also shown in the Final Demand table.

In this publication, the Final Demand table is shown with a breakdown of 18 categories, but at the most detailed level, IO tables are compiled with a breakdown of 172 categories. Regardless of the level of detail, Final Demand tables always distinguish the following broad categories:

1. Personal Expenditure of households<sup>1</sup>,
2. Capital investment by persons, governments and non-profit entities (separately for Construction investment and Machinery and Equipment investment),
3. Current expenditures of governments,
4. Additions to or withdrawals from inventories (withdrawals are shown as negative values),
5. Exports to other provinces,

1. This includes personal spending by residents of a province, whether spent in their own or another province or territory or country while visiting. It also includes the full value of capital equipment under finance leases acquired by individuals (e.g., automobiles). Personal expenditure is higher than actual (cash) spending because of a number of national accounting imputations. These are: an imputation for services (rental value) of owner-occupied dwellings, an imputation for interest payments to financial institutions net of interest income from the same source, an imputation for the investment income of insurance carriers and for changes in their actuarial reserves when related to persons net insurance claims.

6. Imports from other provinces,
7. International and interprovincial exports of a provinces or territory and,
8. International and interprovincial imports of a province or territory.

In the most detailed table these categories are presented with the 727 commodity detail, but are only shown with the more compact 59 commodity detail in this release. Some of these expenditures are presented with a useful breakdown. For instance, Personal Expenditure presented in this release is broken down into durable goods, semi-durable goods, non-durable goods, and services. In the most detailed table, final demand is presented with 172 categories, of which personal expenditure is shown for 52 categories.

### **The Input table**

The input table, also known as the Intermediate Use table, is where purchases that relate to production (current expenses) are presented for groups of producing units (industries). It was noted earlier that, in the context of input-output accounts, "industry" also refers to entities such as governments, non-profit organizations, professions, and so on. In these cases, inputs refer to their current (i.e., non-capital) expenditure on goods and services. The input table includes a few other entries that businesses would report on the expense side of their income statement. These are: Indirect Taxes on Production (e.g., property taxes), Indirect Taxes on Products (e.g., sales taxes), Subsidies on Products (-), Subsidies on Production (-) (e.g., manpower training subsidies), Wages and Salaries, Supplementary Labour Income (e.g., employers' contribution to employment insurance), Mixed Income (e.g., income of unincorporated businesses), and Other Operating Surplus. The latter item is the income or loss that is left over after accounting for the cost of all intermediate inputs and the items just discussed. This ensures that the subtotal of inputs for a given industry is equal to its "outputs" (discussed below) and an accounting identity is maintained between inputs and outputs of industries. The most detailed input table for a province shows up to 727 goods and services used for each of 303 industries. The current release shows a more compact table with 25 industries and 59 goods and services.

### **Gross Domestic Product**

The eight cost entries found in the input table (see previous paragraph) contain all the data one needs to calculate the Gross Domestic Product (GDP) of each industry in Canada or in a province. GDP at basic prices-the statistic officially published by Statistics Canada-is obtained by adding the last six components. GDP at market prices is the sum of all eight cost components. Using this data, we one can calculate the GDP of a province or territory, GDP of the whole Canadian economy, showing either the provincial or the industrial composition of GDP across Canada.

### **The Output table**

The Output table, also known as the Make table, is where the values of production of good and services are recorded for each producing industry in a given jurisdiction (e.g., a province). Once again, the term "industry" is comprehensive, covering all entities except households (persons). In most cases, production or output of an industry is simply their sales or shipments . Production, of course, excludes used goods, because they were already counted as production in an earlier period. For retailers and wholesalers, production is considered to be the value they add to (or the margin they earn from) the products they sell, rather than the total receipt from their sales. For owners of real property, production is gross rent receipts, except for residential properties occupied by their owners where an imputation is made for the equivalent rental value of living in the property.

For banking and similar services, the net interest income of the institutions is considered production. Where they charge fees for their services, they are also considered output. The production of insurance carriers consists of premiums net of claims and adjustment expenses, plus incomes earned on invested reserves as well as rental income, plus changes in actuarial reserves. For construction, the value of work that has been put in place in

a particular jurisdiction is considered output, whether this is done by hired contractors or by the industry (e.g. electric power) on its own account. For holding companies, non-profit institutions (e.g., churches, clubs), the central bank and general government, the value of their output is computed as the sum of operating expenses, labour compensation and depreciation of fixed capital. Hospitals, schools, universities and other institutions that are funded by governments but also earn operating revenues have an additional output equal to their revenues from sales of goods and services. The output table (Small) included in this release shows 25 industries producing 59 commodities. At the most detailed level, the output table shows 303 industries and 727 goods and services for a province, territory, or the Canadian economy.

## **System of National Economic Accounts: New module**

---

Statistics Canada's information and data on the System of National Economic Accounts are available in one convenient online location — and the data are free of charge.

The *National Economic Accounts module*, accessible from the Agency's Web site home page, features an up-to-date portrait of national and provincial economies and their structure.

The module also offers links to recent news releases from The Daily, relevant publications and release dates, glossaries and methodology, contact information and frequently asked questions.

## Presentation of data

### A. Contents of the input-output tables

In the Canadian System of National Accounts, the Input-Output Accounts have two sets of interrelated accounts:

- (a) the Industry Accounts;
- (b) the Commodity Accounts.

The Industry Accounts contain the commodity composition of industry output and its complete costs of production including profits (surplus). The Commodity Accounts, on the other hand, show the supply and disposition of goods and services. The framework of the Canadian Input-Output Tables is closely related to the one described in the United Nations report, System of National Accounts, 1993. The inputs and outputs of industries, classified by commodity, are presented in separate tables. The Canadian Input-Output Tables are rectangular rather than square since the number of goods and services exceeds the number of industries. Square tables have been an international standard for most countries from the beginning of Input-Output concepts. Square means having the same dimensions, either product-by-product tables or industry by industry. The product by product table shows which products are used in the production of which other products; the industry by industry table which is by far the most widely used shows which industry uses the output of which other industry. From our own rectangular framework we can build square tables: industry by industry and industry by categories of final demand.

For each year, three basic tables are prepared:

- 1. Make (Output) Matrix;
- 2. Use (Input) Matrix; and
- 3. Final Demand Matrix.

The Input-Output Accounts are prepared and balanced at the most detailed level known as the "Worksheet" (W) level, with 303 industries for the year 2002 and 2003. The number of goods and services and primary inputs add to 727 in 2002 and 2003. In the final demand, there are 172 categories for the years 2002 and 2003. The Worksheet (W) level data are then aggregated into Link (L), Medium (M), and Small (S) levels for consistency during the entire period as shown in the following table.

**Text table 1**  
**Dimension table**

Designation of aggregation	Number of industries	Number of final demand categories	Number of goods and services and primary inputs
S (Small)	25	18	59
M (Medium)	62	37	111
L (Link)	117	122	469
W (Worksheet)	303	172	727

At the W, L and M levels of detail, some of the entries in various national matrices are confidential under the provisions of the Statistics Act. Consequently, data are provided to users after suppressing the confidential cells

where applicable. The provincial tables are available at the “S” level of aggregation only and cell suppression is performed at that level.

The tables in the present publication are at the S level of aggregation, covering 51 goods and services and 8 primary inputs, (a total of 59), 25 industries and 18 final demand categories<sup>1</sup>. The concordances among the various levels of aggregation for industries, goods and services and primary inputs are provided in the Appendix A.

## B. Understanding the content of the national input-output tables

The section presented here highlights the descriptive and the analytical usefulness of input-output data, using a series of examples. Observed relationships between industries producing several goods and services and various users of these goods and services allow establishing meaningful economic relationships. A number of possible applications of the data are also offered. The examples are meant to familiarize the reader with the richness of the basic data as well as their potential for various analytical uses. For simplicity we present the data content using the **National Input-Output Tables**. The same demonstration applies to the provincial tables as well.

The illustration uses one industry “manufacturing”, and one commodity, “petroleum & coal products”, at the S level of aggregation. Utilizing data for 2003 (tables 7, 8 and 9), the industry can be identified as column 8 of the Make and Use Matrices and the commodity as row 26 in the Make, Use and Final Demand Matrices.

- i. Producers
- ii. Users
- iii. Composition of outputs and inputs
- iv. Gross domestic product (GDP) by industry
- v. Gross domestic product (GDP) for the total economy
- vi. Domestic availability of goods and services
- vii. Import shares
- viii. Export shares
- ix. Indirect taxes and subsidies

### (i) Producers

The simple question, “who produces what?” is easily answered by referring to the Make Matrix where each row shows the distribution of output of each commodity by industry and where each column lists the distribution of output of each industry by commodity. For example, one may find that in 2003 the manufacturing industry (column 8 of the Make Matrix) produced \$39,368.7 million of petroleum and coal products (row 26) whereas all domestic industries combined (row 26 in the last column of the Make Matrix) produced \$44,899.5 million of that commodity. Thus, the manufacturing industry accounted for 87.7 percent of the total domestic production of this commodity in 2003  $(39,368.7 / 44,899.5) \times 100 = 87.7$  percent.

### (ii) Users

The Input-Output Tables display the demand for various goods and services which may be used as intermediate inputs (goods and services that are purchased by an industry from other industries to produce its outputs) or for final consumption by persons, governments, etc. So, the question, “who buys what?” is answered by referring to

1. The final demand categories reflect mainly spending by consumers, fixed capital formation, inventories and imports and exports.

the Use (Input) and Final Demand Matrices. Elements in the row of the Use Matrix show the use of a particular commodity by various industries whereas elements of the same row appearing in the Final Demand Matrix indicate its use by various categories of final demand. For example, in 2003, altogether, industries used petroleum and coal products worth \$27,183.8 million – the sum of row 26 across the columns of the Use Matrix. Individual entries across row 26 represent individual uses by the industry shown as a column.

### **(iii) Composition of outputs and inputs**

The detailed presentation of data on outputs and inputs presented in this publication permits analysis of the composition of outputs and inputs of each industry over time. Once again, using the Make Matrix, one is able to observe, say for 2003, that the total output of the manufacturing industry (column 8) amounted to \$589,546.2 million. Of this, petroleum and coal products accounted for \$39,368.7 million which represents 6.7 percent of the total output of that industry. In a similar manner, inputs that are needed to produce outputs of industries can be identified in the Use Matrix. For example, column 8 of the Use Matrix lists various inputs needed to produce the output of the manufacturing industry. The magnitude of changes in the value of inputs over time can be identified and analyzed.

### **(iv) Gross domestic product (GDP) by industry**

Generally speaking, the gross output of an industry consists of the value of the goods and services produced by that industry: the value of steel produced by the steel industry; the value of cars and trucks produced by the motor vehicles manufacturing industry; etc. A brief reflection tells us that, for example, the production of steel requires coal and iron ore and other inputs. These goods and services are not the products of steel mills. Rather, they are produced by other industries and used by the steel mills as their inputs. Thus, a measure of the unduplicated production of an industry should exclude all intermediate inputs purchased from other industries. This measure is called value added or Gross Domestic Product.

The Use Matrix displays all the costs incurred in production by an industry: the goods and services used as intermediate inputs; indirect taxes and subsidies; and returns to the factors of production (rows 56 to 59 of the Use Matrix), namely: wages and salaries, supplementary labour income, mixed income and other operating surplus.

### **(v) Gross domestic product (GDP) for the total economy**

There are two measures of the Gross Domestic Product which provide valuation of the production of goods and services at different levels. They are:

- (a) Gross Domestic Product at Basic Price
- (b) Gross Domestic Product at Market Prices.

The valuation at basic price is the internationally preferred method to value the cost of factors of production used in the production process. Market price valuation reflects actual costs to the users. It is a concept that is used to measure consumption. The difference between the two concepts is the value of taxes on products, net of subsidies. GDP at basic price can be calculated from the (IO) Tables. In the detailed tables we distinguish eight elements in the primary inputs which can be used to calculate both the GDP at market price and the GDP basic price. The detailed list of these primary inputs is as follows: indirect taxes on products; subsidies on products; subsidies on production; indirect taxes on production; wages and salaries; supplementary labour income; mixed income and other operating surplus.

It is important to note that the valuation at basic price is the internationally preferred method to value the cost of factors of production used in the production process. Market price valuation reflects actual costs to the users. It is a concept that is used to measure consumption. The difference between the two concepts is the value of taxes on products, net of subsidies. GDP at basic price can be calculated from the IO Tables. In all IO tables we distinguish eight elements in the primary inputs which can be used to calculate both the GDP at market price and the GDP basic price. The detailed list of these primary inputs is as follows:

- Indirect taxes on products;
- Subsidies on products ( - );
- Subsidies on production ( - );
- Indirect Taxes on production;
- Wages and salaries;
- Supplementary labour income;
- Mixed income;
- Other operating surplus.

To calculate GDP at market price all the components above must be added while the GDP basic price is obtained by summing the last six components of the same list.

When evaluated at basic prices, an industry's GDP is the sum of its factor incomes (wages and salaries, supplementary labour income, mixed income and other operating surplus) plus taxes less subsidies on production (labour and capital).

Basic Price valuation represents the earnings of the factors of production as measured by the costs of labour (wages and salaries, supplementary labour income); capital inputs (mixed income and other operating surplus); plus indirect taxes on factors of production less subsidies on production. Indirect taxes on products (row 52) are a cost to the industry and are reflected in the market price of goods and services produced by the industry. Subsidies on products (row 53), where applicable, have the effect of lowering cost to the firms receiving them, and thus reduce the market prices of goods and services produced by the industry. They are shown as negative (-) entries in the Use (Input) Matrix. Both indirect taxes and subsidies on products and on production affect the market price valuation of goods and services.

It should be noted that indirect taxes are paid not only by the business sector but also by other sectors of the economy which are covered in the Final Demand Matrix of this publication. Subsidies, by definition, apply only to the business sector of the economy.

The GDP at Market Prices as calculated from a revenue approach is called income-based GDP and from an expenditure approach is called expenditure based GDP. The Input-Output Accounts also incorporate components of expenditure-based GDP and is obtained by summing up personal expenditure, capital formation, government current expenditure, change in the value of inventories and net exports (exports less imports) appearing in the Final Demand Matrix. In the Final Demand Matrix, these categories are shown at a finer level of detail.

#### **(vi) Domestic availability of goods and services**

It may be of interest to know the domestic availability of a particular commodity (or all goods and services) for one or many years. The domestic availability of a commodity is defined as total production less exports plus imports (assuming no inventory change). These values can be read directly from the Input-Output Tables. In 2003, the domestic production of petroleum and coal products was \$44,899.5 million (last column of the Make (Output) Matrix) while total exports were \$10,118.8 million (column 14 of the Final Demand Matrix) and imports were \$5,133.9 million (column 16 of the Final Demand Matrix). Thus, the domestic availability of this product

can be derived as: \$44,899.5 million domestic production - \$10,118.8 million exports + \$5,133.9 million imports = \$39,914.6 million.

### (vii) Import share

The data used in the preceding section also allow the calculation of the import share of a commodity, that is, what portion of the domestic availability of a commodity comes from foreign countries. From these data, the import share for the same commodity can be calculated as follows:

$(\text{Total imports} / \text{Total domestic availability}) \times 100$

that is for 2003:

$(5,133.9 / 39,914.6) \times 100 = 12.9$  percent.

### (viii) Export share

For countries with considerable foreign trade like Canada, there is a keen interest in measures of export intensity. A simple indicator of such an intensity is the proportion of total domestic production that is exported. Using the same commodity as in the previous illustrations, 22.5 percent of the domestic production of petroleum and coal products was exported in 2003 as follows:

$(10,118.8 / 44,899.5) \times 100 = 22.5$  percent.

### (ix) Indirect taxes and subsidies

In compiling Input Output Accounts at producers' prices and purchasers' prices, the costs or margins that arise between the value received by the producer (i.e. the value that covers all costs of production) and the value paid by the purchaser must be identified. One of these margins is the value of commodity taxes paid by the purchaser, be it an industry or a category of final demand. All commodity indirect taxes and all other indirect taxes are classified to the industry or final demand category paying them. The total of such taxes agrees with values published in the National Economic and Financial Accounts (Catalogue 13-001-X) but the Input Output Accounts provide additional information such as the industries and final demand categories which pay these taxes. Similarly, in the Input-Output Tables, subsidies are allocated to the industries receiving them. Also, from 1986 onwards, subsidies are broken down into two categories: commodity subsidies and non-commodity subsidies. These details and their routing in the Input-Output Accounts make additional analyses possible, e.g., to determine the effects of taxes and subsidies, to build certain policy simulation models, etc. <sup>2</sup>

### Data Accuracy Measures

Data from Input-Output Accounts presented in this publication are assessed for relative statistical reliability and assigned a rating that indicates the level of confidence with which they may be used (see appendix: text table 1). The ratings refer to data for the latest benchmark year for which estimates are published. The ratings are 'A' for the most reliable data, 'B' for reliable data, and 'C' for data that is less reliable but still acceptable. The ratings are determined for outputs, intermediate inputs and GDP components of each Link or 'L' level input-output industry. The ratings apply to entire vectors, rather than individual data points. For instance, a rating of 'A' or most reliable applies to all outputs of the Crop and animal production industry, whereas the industry's intermediate input vector as a whole is assigned a 'B' rating. The industry's GDP components are also assigned a 'B' rating.

Data reliability ratings are a product of data integration and analysis inherent in the compilation of input-output tables. They rely both on the quantitative attributes of the survey and administrative data sources that are used, such as

2. See for example Durand, René and Rioux, Ronald: "Estimating Final Demand Expenditure at Factor Cost and Net Prices Indices", *Economic Systems Research*: Vol. 6, No. 3, 1994, pages 265-275.

sample size, response rate and coefficient of variation, and on the expert judgement of analysts who undertake data integration of various source data. In general, the highest quality rating is assigned to a data set that originates from a survey or administrative source with the largest sample size and smallest undercoverage that requires no indirect estimation of missing detail. A reliable or 'B' rating is assigned to a data set estimated from source data with some but not all of the above attributes. Finally, data sets with a 'C' rating involve significant application of indirect estimation techniques and rely on source data with small samples, undercoverage, or both.
