## Highlights

- Corporations earned record high operating profits of $\$ 55.0$ billion in the third quarter of 2005 , a $2.9 \%$ increase over the second quarter. Soaring oil and natural gas prices propelled energy sector profits to record highs, accounting for virtually all of the overall profit gain.

## Analysis - Third quarter 2005 (preliminary)

Corporations earned record high operating profits of $\$ 55.0$ billion in the third quarter of 2005, a $2.9 \%$ increase over the second quarter. Profits have risen for 4 consecutive quarters, and for 13 of the past 15 quarters. Soaring oil and natural gas prices propelled energy sector profits to record highs, accounting for virtually all of the overall profit gain. Excluding the oil and gas and petroleum and coal industries, third quarter operating profits edged up $0.1 \%$.

Chart 1
Operating profits continue to rise

The non-financial industries reported $\$ 42.1$ billion in third quarter profits, a $4.6 \%$ improvement over the second quarter. Excluding the energy sector, about half of the non-financial industries turned in profit gains, but these were tempered by declines in the remaining industries. Manufacturing profits declined for the fourth time in the past five quarters.

The financial industries saw profits trimmed $2.1 \%$ to $\$ 12.9$ billion in the third quarter, mainly due to lower chartered bank and credit union profits.

## Note to readers

These quarterly financial statistics cover the activities of all corporations in Canada, except those that are government controlled or not-for-profit.

Operating profits represent the profits earned from normal business activities, excluding interest expense on borrowing and valuation adjustments. For non-financial industries, operating profits exclude interest and dividend revenue and capital gains/losses. For financial industries, interest and dividend revenue, capital gains/losses and interest paid on deposits are included in the calculation of operating profits.

After-tax profits represent the bottom-line profits earned by corporations.

Chart 2
Profit growth continues in third quarter

## Higher prices boost mining profits

Oil and gas extraction companies reaped the benefits of soaring oil and gas prices, as profits swelled $16.6 \%$ from the second quarter to a record high $\$ 8.7$ billion in the third quarter. Natural gas export prices surged in the quarter due to production disruptions caused by hurricanes Katrina and Rita in the US South. Crude oil prices strengthened amid continuing concerns over supply.

Metal mining companies earned $\$ 1.9$ billion in third quarter operating profits, up $11.1 \%$ from the second quarter. Steady increases in non-ferrous metal prices over the past few years have contributed to a more than six-fold jump in profits since bottoming out at $\$ 0.3$ billion in the third quarter of 2003.

## Wholesalers and retailers more profitable

Wholesalers enjoyed an $11.4 \%$ increase in operating profits in the quarter, led by wholesalers of machinery and equipment. Operating revenue rose $1.7 \%$ to $\$ 97.6$ billion, extending a streak of eight consecutive quarterly increases.

Retailers also gained ground in the third quarter, as profits advanced $4.8 \%$ to $\$ 3.6$ billion. Operating revenue increased $1.1 \%$ to $\$ 95.4$ billion. Retail sales have been generally rising since the start of 2004 , despite some monthly fluctuations.

## Mixed results for manufacturers

Manufacturing profits edged down $1.2 \%$ to $\$ 10.6$ billion in the third quarter, the fourth decline in the past five quarters. Gains by manufacturers of motor vehicles and parts and petroleum and coal were more than offset by weakness in most of the remaining industries. Manufacturers continue to face the challenges of rising fuel and other input costs, the robust Canadian dollar and strong foreign competition. However, the most recent Business Conditions Survey
reported that slightly more manufacturers anticipated increasing production levels in the fourth quarter than those expecting production to decline.

Motor vehicle and parts manufacturers earned $\$ 0.9$ billion in third quarter operating profits, up from $\$ 0.6$ billion in the second quarter. Operating revenue grew $9.1 \%$, as extensive incentive programs sustained sales. Exports of automotive products strengthened in the quarter, but remained below the peak levels of 2004. Domestic sales of new motor vehicles slipped in the latter two months of the quarter, but still gained ground for the quarter on the strength of robust July sales. The Monthly Survey of Manufacturing reported that shipments of motor vehicles were up in the third quarter, despite a hefty slide in September.

Petroleum and coal manufacturers earned record high operating profits of $\$ 3.0$ billion in the third quarter, up $9.7 \%$ over the second quarter. Petroleum prices have risen steadily over the past two years, peaking in the most recent quarter on the heels of the hurricanes in the southern United States.

On the down side, primary metals producers earned $\$ 0.3$ billion in third quarter operating profits, less than half of those earned in the second quarter. Rising energy costs, softening demand and lower steel prices contributed to the current quarter decline.

Wood and paper producers saw profits pared $19.7 \%$ to $\$ 0.9$ billion in the third quarter. Profits have weakened for five consecutive quarters from the recent peak of $\$ 2.1$ billion in the second quarter of 2004. The export market softened in 2005 and lumber prices declined, but demand from south of the border should strengthen as the US Gulf Coast rebuilds. Meanwhile, newsprint makers continued to struggle with declining markets.

## Financial sector trimmed by lower bank and credit union profits

The depository credit intermediaries' operating profits retreated $6.1 \%$ to $\$ 5.4$ billion in the third quarter. Within this industry, the chartered banks saw profits slip to $\$ 4.9$ billion in the third quarter from $\$ 5.1$ billion in the second quarter, largely due to higher provisions for loan losses and litigation claims. Credit unions also showed a decline, as their profits fell to $\$ 0.4$ billion from $\$ 0.6$ billion in the second quarter due to lower gains on the valuation of derivatives.

Non-depository credit intermediaries reported a $9.5 \%$ increase in operating profits to $\$ 2.0$ billion. Insurance companies' profits were essentially flat at $\$ 3.2$ billion, as gains by life, health and medical insurers were offset by lower profits by property and casualty insurance carriers.

## Profitability ratios

The operating profit margin continued to strengthen in the quarter, rising to $8.3 \%$ from $8.2 \%$ in the previous quarter. This profitability indicator has been on an upward trend since slipping to $5.3 \%$ in the final quarter of 2001.

The return on shareholders' equity, based on after-tax profits, climbed to $11.4 \%$ from $11.0 \%$ in the second quarter. The most recent return on equity is the strongest in five years.

## Notes:

- A common (generic) financial statement presentation format is used for all industries and for aggregate totals. As a result, some financial series that do not apply to certain industries will be shown with zero values.
- All data in this table are unadjusted unless otherwise specified.
- Figures may not add due to rounding.

## Survey Description

## Description and use of the data

The data collected by the Quarterly Survey of Financial Statistics for Enterprises (QFS) comprise financial statements typically prepared by incorporated businesses to record their financial position and performance. The data include asset, liability and equity items encompassed in a quarterly balance sheet and revenue and expense items as reported on a quarterly income statement, along with additional supplementary items.

Information collected as part of the Quarterly Survey of Financial Statistics for Enterprises serves two broad objectives. The first measures the financial position and performance of incorporated businesses by industry aggregations and is the main focus of this publication. The statistics are used by a wide variety of economists and industry analysts, including federal and provincial regulatory bodies that monitor financial and other institutions in Canada. This information is also a critical input into the measure of corporate profits and capital consumption allowances in the Canadian System of National Accounts (CSNA).

The second broad objective is to provide information on financial holdings and transactions in the CSNA sector accounts. The accounts comprise the National Balance Sheet Accounts and the Financial Flow Accounts. Within the CSNA, the Canadian economy is composed of the incorporated business sector, including non-financial and financial businesses, the government sector, and the persons and unincorporated business sector, which includes non-profit institutions serving households. The Quarterly Financial Survey data (used to prepare this publication) are combined with additional information for the business and other sectors in order to produce complete economy-wide accounts which show the creation and distribution of wealth as well as the financing of economic activity. This is made possible by presenting considerable detail on financial institutions within the sector accounts framework.

In addition, the flow of funds and outstanding positions between Canadian residents and non-residents is measured in "Canada's Balance of International Payments" and in "Canada's International Investment Position," respectively. Both of these releases make use of the quarterly survey data in measuring corporate financial activity with non-residents.

## Frequency and reference period

The data series are collected quarterly. The objective of the survey is to cover a calendar reference period (i.e., quarters ending in March, June, September or December). However, the data collected for each enterprise usually covers fiscal quarters (which may not coincide with calendar quarters). Estimates for a calendar quarter are prepared by combining individual data for enterprises with different fiscal quarters. The calendar period is estimated by including all of the fiscal quarters ending in the calendar quarter. For example, the estimates for the second quarter include all fiscal quarters ending in April, May or June (see Text table 1).

Text table 1
Calendar quarter for publication

| Quarter |  | Includes fiscal quarters ending in: |
| :--- | ---: | ---: |
| First | January | February |
| Second | April | May |
| Third | July | August |
| Fourth | October | November |

## Coverage

The domestic economy consists of the non-financial and financial business sectors, the government sector, and the persons and unincorporated business sector, which includes non-profit institutions serving households. This publication covers incorporated enterprises of the financial and non-financial business sectors. Business enterprises controlled by governments are excluded from the Quarterly Survey of Financial Statistics for Enterprises and are surveyed by the Public Institutions Division of Statistics Canada. Non-profit enterprises are also excluded from this survey.

## The Statistical unit

For purposes of compiling statistics, Statistics Canada defines a hierarchical structure of units for each business. The four standard statistical units that are used are listed from largest to smallest below:

- Enterprise
- Company
- Establishment
- Location

The statistical unit used in the Quarterly Survey of Financial Statistics is the enterprise. An enterprise is a family of businesses under common ownership and control for which a set of consolidated financial statements is produced on an annual basis.

In the case of simple enterprises, the enterprise and the establishment coincide and both are classified to the same industry. However, there exist many multi-establishment enterprises whose establishments may belong to one or more industries. Such enterprises are classified to the predominant industry of their establishments.

It should be noted that NAICS Canada data compiled on an enterprise basis cannot be directly compared with NAICS Canada data on an establishment basis.

## Accounting concepts, definitions and practices

The concepts and definitions for most industries are based on the guidelines of the Canadian Institute of Chartered Accountants. Regulated industries may follow practices and definitions determined by the regulators. However, these practices are usually similar to the Generally Accepted Accounting Principles (GAAP) of the Canadian Institute of Chartered Accountants.

## Scope

The financial items presented in this publication are those included in the following accounts or statements:

- Balance Sheet
- Income Statement
- The Statement of Changes in Financial Position

Although they are not included in this publication, additional financial items are available for some industries upon request.

## Financial classification and presentation

There is no widely accepted standard classification of financial items. Accordingly, it was necessary to devise one in order to present information in a homogeneous way for all enterprises. The financial item presentation in this publication has been condensed somewhat to allow for a homogeneous presentation across industries. Additional financial detail is available upon request.

## Industrial classification

Beginning with the first quarter of 2004 publication, the quarterly financial series switched to the North American Industry Classification System (NAICS Canada 2002) basis of industrial classification from the previously used NAICS Canada 1997 basis. The previous set of industrial aggregations consisting of 157, 58 and 24 groups has been replaced by a new set of 67, 48 and 22 industry groups, and a group of 10 financial instruments. Historical data on a NAICS Canada 2002 basis were created using a concordance that converted the old NAICS Canada 1997 codes to the new NAICS Canada 2002.

NAICS was developed by the statistical agencies of Canada, Mexico and the United States to provide a consistent framework for the collection, analysis and dissemination of industrial statistics used by government policy analysts, by academics and researchers, by the business community, and by the public.

NAICS is a product-oriented industry classification that standardizes the way businesses are classified across Canada, Mexico and the United States. NAICS was primarily designed to classify economic production performed at the establishment level; the activity which contributes the most value-added determines the NAICS code for the establishment.

To determine which NAICS Canada 2002 code should be assigned to a statistical enterprise, the NAICS Canada 2002 code is determined for each establishment belonging to the statistical enterprise. The NAICS Canada 2002 code representing the largest value-added is then assigned to the statistical enterprise. The NAICS Canada 2002 classification system does not provide classifications for integrated activities. For example, a petroleum enterprise may be involved in exploration, mining, refining, shipping and retailing of petroleum products. Under NAICS Canada 2002 such an enterprise is classified to the individual NAICS Canada 2002 code that relates to the activity that provides the most value-added.

The quarterly financial statistics are available at three levels of industrial aggregation of NAICS Canada 2002. The most aggregate level, which is used in this publication, covers 22 categories (see Text table 1). The second level of aggregation covers 48 categories and is available upon request. The most detailed level of aggregation covers 67 categories from 1999 and beyond and is also available upon request. The industrial classification system is hierarchical in nature so that the more detailed levels of data easily aggregate to the higher levels.

Text table 1
Publication level of aggregation

| Title | Enterprise category code | $\begin{array}{r} \text { NAICS } \\ \text { Canada } 2002 \\ \text { codes included } \end{array}$ |
| :---: | :---: | :---: |
| Agriculture, forestry, fishing and hunting | 11 | 11 |
| Oil and gas extraction and support activities | 21C | 211, 213 |
| Mining (except oil and gas) | 212 | 212 |
| Utilities | 22 | 22 |
| Construction | 23 | 23 |
| Manufacturing | 31-33 | 31, 32, 33 |
| Wholesale trade | 41 | 41 |
| Retail trade | 44-45 | 44, 45 |
| Transporation and warehousing | 48-49 | 48, 49 |
| Information and cultural industries | 51 | 51 |
| Real estate and rental and leasing companies | 53 | 53 |
| Professional, scientific and technical services | 54 | 54 |
| Administrative and support, waste management and remediation services | 56 | 56 |
| Educational, healthcare and social assistance services | 61-62 | 61-62 |
| Arts, entertainment and recreation | 71 | 71 |
| Accommodation and food services | 72 | 72 |
| Repair, maintenance and personal services | 81A | 811,812 |
| Non-depository credit intermediation | 5222 | 5222 |
| Insurance carriers and related activities | 524 | 524 |
| Activities related to credit intermediation | 5223 | 5223 |
| Depository credit intermediation | 5221 | 5221 |
| Securities, commodity contracts, and other financial investments and related activities | 523 | 523 |

## Deriving the estimates

## The Statistical methodology

The overall estimates are derived from two different components. A sample survey is conducted for larger businesses above a prescribed size threshold using the mailed questionnaire. Sample results are multiplied by a weighting factor to represent the universe from which the sample was drawn. For businesses below the size threshold, the (take-none) estimate is derived by applying a regression technique to annual data compiled from Revenue Canada financial statements. The model projects the value of the take-none portion of the population by the 67 categories of the Level III aggregation using estimates from the surveyed population and other parameters. The proportion of each of the two components of the final estimate (survey and take-none model) varies significantly between industry aggregations. The proportion represented by the surveyed component ranges from $5 \%$ to $100 \%$ of the population for both revenue and assets at the Level III aggregation.
(See Text tables 1 and 2 showing the percentage of assets and operating revenue represented by the take-none component for each of the Level 1 ( 22 industry) groups.)

Text table 1

Take-none percentage table, total assets

|  | NAICS | Second quarter 2005 |  |  | Third quarter 2005 |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Sample design for the survey component

The frame used for sampling purposes is the Statistics Canada Business Register (BR). A stratified random sample is used. There are two size strata for each of the Level III ( 67 categories) aggregations (take-all and take-some). All units in the first stratum (take-all) are selected. For the lower stratum (take-some), sampling rates vary by aggregation, but average to about one unit selected in seven. The total sample size is approximately 5,500 enterprises.

## Stratum boundaries

The stratum boundaries for the take-all, take-some and take-none strata vary by industry aggregation. The boundaries are available upon request.

## Sample weights and imputation for incomplete responses or non-response

Although significant effort and resources are used to maximize response rates, there is always an element of non-response in a statistical survey. Units which do not respond in the current period are imputed (their characteristics are estimated). Units are imputed by applying a growth factor to previously reported data when available. The growth factor is estimated using the survey responses for the units that are most similar to the unit being imputed.

When partial survey data covering three key variables (total assets, operating revenue, operating profit) are received, the imputation factors are calculated at the unit level using these partial data. For records without historical information, a donor imputation system is used. Information on the size of the non-respondent is obtained and a similar sized respondent is found. The size information consists of the three key variables. If this information is not available, the Business Register revenue and asset values are used. In the former situation, the donor record is used to calculate the distribution of the detailed values around the three key variables. In the latter case the donor's values are directly copied over to the non-respondent. In the case where donor imputation is required for two or more consecutive quarters, a new donor is not reselected. Rather, the imputation factor is applied to the previously imputed data.

The response values for sampled units are multiplied by a sampling weight in order to estimate for the entire surveyed population. The sampling weight is calculated using a number of factors, including the probability of the unit being selected in the sample.

## Seasonal adjustment

The seasonal component of a time series reflects sub-annual movements caused by characteristic weather changes, holidays or other factors which tend to recur every year at approximately the same time. The seasonal adjustment process attempts to quantify the seasonal component in a time series and to remove its effect from observed data.

The seasonal adjustment method used is a computerized ratio-to-moving-average method in widespread use at Statistics Canada. It is based on the U.S. Bureau of the Census Method II, but has some additional features. Beginning with the first quarter of 1999, the Quarterly Financial Statistics series uses "end-point" seasonal adjustment, which recalculates seasonal factors each quarter as more recent data becomes available. For a more complete description of these features, refer to "X11ARIMA v. 2000 - Seasonal Adjustment Method Foundations and User's Manual."

Series containing no significant seasonality have not been seasonally adjusted. In these cases, the unadjusted series are used in the place of seasonally adjusted data.

## Data quality

There are two categories of errors in statistical information - sampling errors and non-sampling errors. Sampling errors are errors that arise because estimates are being prepared based on a sample of the universe rather than collecting information from all units in the universe. These errors can be measured.

Non-sampling errors can arise from a variety of sources and are much more difficult to measure. Non-sampling errors include errors in the information provided by respondents, data capture errors and other processing errors.

## Sampling errors

Sample surveys are designed to provide the highest sampling efficiency (the smallest sample that will produce a sampling error of a given size). This optimization is usually performed for only a few variables, limited by the data items that are available at the time of sample design and selection, the resources available, and the complexity introduced by trying to optimize for many variables at one time. The sample used for these statistics was designed to produce a reasonable level of accuracy for assets and revenue. Consequently, other items may be less accurately estimated.

A measure of the sampling error is the standard error. This measurement is based upon the idea of selecting several samples, although in reality only one sample is drawn. Sampling variability can also be expressed relative to the estimate itself. The standard error as a percentage of the estimate is called the coefficient of variation (CV), or the relative standard error. Small CVs are desirable, since the smaller the CV, the smaller the sampling variability relative to the estimate.

The sample for the Quarterly Survey of Financial Statistics for Enterprises was drawn such that the CV at the Level III ( 67 categories) aggregation, should be no more than $10 \%$ for operating revenue or total assets. The CV indicators are shown next to these variables in the tables according to the scale presented on page 2 .

## Estimation errors in the non-sampled strata

The estimate for small businesses (take-none portion) is prepared by applying a statistical model to predict the value of the take-none portion of the population by Level III ( 67 categories) aggregation using the estimates from the surveyed population and other parameters. The error introduced by this method depends on several factors, including the contribution of these strata to the overall estimate and the error in estimating the movement of the strata using sampled units and other external factors. It is difficult to calculate a coefficient of variation for the non-sampled strata, as the estimates are calculated at the Level III aggregation level only. Therefore, the CV indicator displayed in the publication reflects only the survey portion of the estimate. When the estimate reflects only the take-none portion, there is no CV indicator shown.

## Other non-sampling errors

There are no objective measures of other non-sampling errors applied to these statistics. However, most reporting and data entry errors are corrected as a result of the intricate computer capture and edit procedures applied to the data. This is particularly effective for financial data where accounting relationships are established and balancing is required. However, most financial data collected are derived from audited financial statements resulting in minimal errors and inconsistencies. As well, the Quarterly Survey of Financial Statistics for Enterprises utilizes trained accounting staff to capture and analyze reported data to minimize the frequency of non-sampling errors.

One source of non-sampling error is the non-response error. There are several measures that can help the user evaluate this type of error, including the response rate and the data response rate.

The response rate (see Text table 3) is a measure of the proportion of those sample units which have responded in time for inclusion in the estimate. To calculate the response rate, one should simply divide the number of actual responses by the total number of sampled units. For example, a sample with 20 active units for which 10 respond for a particular quarter would have a response rate of $50 \%$.

Response rate is:
Complete + partial response
Complete + partial response + non-response

Text table 3
All enterprise measure of sample response

|  | Quarter |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Third quarter 2003 | Fourth quarter 2003 | $\begin{array}{r} \text { First } \\ \text { quarter } \\ 2004 \end{array}$ | Second quarter 2004 | Third quarter 2004 | Fourth quarter 2004 | First quarter 2005 | Second quarter 2005 | Third quarter 2005 |
|  |  |  |  |  | ntage |  |  |  |  |
| Response rate | 61.6 | 67.8 | 69.2 | 64.6 | 59.4 | 51.9 | 57.0 | 54.6 | 37.4 |
| Asset response rate | 85.4 | 87.3 | 86.7 | 89.6 | 87.9 | 83.1 | 85.1 | 83.1 | 67.9 |
| Revenue response rate | 81.2 | 84.4 | 84.4 | 81.8 | 77.2 | 71.3 | 73.0 | 71.5 | 55.9 |
| Weighted asset response rate | 80.9 | 85.0 | 84.7 | 86.9 | 84.4 | 79.5 | 82.3 | 80.7 | 64.9 |
| Weighted revenue response rate | 75.7 | 79.8 | 79.8 | 76.1 | 72.2 | 65.7 | 67.4 | 66.2 | 52.0 |

The data response rate is the proportion of the estimate which is based upon actual reported data. The data response rate can be calculated by dividing the design assets or revenue (or whatever variable is being analyzed) represented by the responding units by the corresponding value for the entire sample. In the previous example, if the 10 responding units have a design asset value totaling $\$ 15$ billion out of a total sample asset value of $\$ 20$ billion, the data response rate for assets would be $75 \%$.
(Where the design value is a frame value for the record which is derived from administrative sources and is available for the entire population.)

Data response rate for assets is:

> | Total assets from completed responses |
| :--- |
| + total assets from partial responses |
| Total assets from completed responses |
| + total assets from partial responses |
| + total assets from others |

(Where asset values are the design values.)
Weighted data response rates consider that units in sample represent more than themselves through weighting factors. Some units contribute more to the estimates than other units when weights are applied. The weighted data response rate can be calculated by dividing the respondents' weighted frame value by the weighted sample for assets or revenue (or whatever variable is being analyzed).

In the previous example, if the weighted asset value of the responding 10 units is $\$ 40$ billion out of a total sample weighted asset value of $\$ 50$ billion, the weighted asset response rate would be $80 \%$.

Weighted data response rate for assets is:

| Total weighted assets from completed responses <br> + total weighted assets from partial responses |
| :---: |
| Total weighted assets from completed responses |
| + total weighted assets from partial responses |
| + total weighted assets from others |

(Where the weighted assets for a respondent is defined as the design weight multiplied by the design assets value.)

## Limitations of the data

To be valid for either time-series or cross-sectional analysis, the definitions of data must be consistent within time periods or across time periods. In other words, the differences and similarities in data must reflect only real differences and not differences in the concepts or definitions used in preparing the data. The ability to use the data for analysis depends on the conceptual framework in which the data are being used.

These data are consistent with the Generally Accepted Accounting Principles (GAAP) of the Canadian Institute of Chartered Accountants. As such, they do not necessarily agree with the concepts used within the Canadian System of National Accounts.

While the GAAP concepts are appropriate for the application of the data, there may still be some problems of consistency (between units or over time) for items where GAAP does not prescribe a particular treatment or allows some latitude. One of the general problems with GAAP for some uses is that it prescribes a historical cost treatment of assets (i.e., their cost at the time of acquisition). As a result, caution should be used when comparing balance sheet data and ratios over time and across industries.

## Confidentiality

The confidentiality of the reported statistics to the quarterly survey is protected under the provisions of the Statistics Act. Accordingly, statistics are released in aggregate only, with no potential identification of individually reported information. The confidentiality provisions of the Statistics Act override the provisions of the Access to Information Act to guarantee the confidentiality of reported data of individual respondents.

## Definitions of financial ratios

## Debt to equity

This ratio examines the relationship of debt (loans, bonds, debentures) to shareholders' equity. It compares the relative size of debt to resources invested by the owners. It indicates the extent to which a firm relies on borrowed funds to finance its operations. Firms that rely heavily on borrowed funds are said to be highly leveraged.

## Formula

Debt to equity:

Borrowings + loans and accounts with affiliates
Total equity

## Profit margin

Operating profit is the net result of the principal business activities of a firm. It is calculated before taking into account interest expense, investment income, non-recurring losses from the write-down of assets, gains or losses realized on the disposal of assets, and income tax expense. This ratio indicates management's ability to generate earnings from the principal business activities of a firm. The ratio is expressed as a percentage of operating revenue.

## Formula

Profit margin:

Operating profit (S.A.) $\times 100$
Total operating revenue (S.A.)

## Return on equity

This ratio measures the level of return to the owners (investors) and it represents their measure of profitability. The earnings figure is the after-tax profits, including a deduction for interest expense (payments to lenders). It is the net profit available to the owners (investors). The ratio indicates how many cents are returned to every dollar invested by the owners.

## Formula

Return on equity:
$\underline{\text { Profit before extraordinary gains (S.A.) } \times 4 \times 100}$
Total equity

## Return on capital employed

This ratio measures profitability and how well management has employed the assets, by calculating the percentage return on total capital provided by the owners and lenders (creditors). The earnings figure is calculated before taking into account interest expense (payments to lenders) and dividends (payments to owners). The ratio indicates how many cents are returned to every dollar of capital invested.

## Formula

Return on Capital Employed:
Profit before extraordinary gains + (interest

$$
\text { on borrowings net of tax) (S.A.) } \times 4 \times 100
$$

Borrowings + Loans and accounts with affiliates

+ Total equity

Please note: The entire numerator in the calculation is seasonally adjusted but is not published as a separate variable.
