## Rental Market Tightens in 2005

- Metro Edmonton's apartment vacancy rate decreased from 5.3 per cent in October 2004 to 4.5 per cent in October 2005.
- Edmonton's apartment availability rate also declined, from 6.9 per cent in October of last year to 5.7 per cent this October.
- Row/townhouse vacancies fell from four per cent last year to 3.3 per cent this October. The availability rate for row units stood at 4.6 per cent this fall.
- Apartment rents have increased, on average, by 1.4 per cent this year or nine dollars per month. This follows a 1.2 per cent (eight dollars per month) average increase between October 2003 and October 2004.

## Apartment Vacancies Turn the Corner

Following three consecutive years of steady increases, apartment vacancies in Greater Edmonton turned the corner in 2005. The apartment vacancy rate in the Edmonton region fell from 5.3 per cent in October 2004 to 4.5 per cent this October. CMHC's survey identified 2,943 vacant apartments out of a total universe of 66,057 rental apartment units. This compares with a total of 3,502 vacant apartments that were on-hand in October 2004. A slowdown in rental apartment starts, the rising costs of home ownership and weaker rent increase in the past two years helped bring about the turnaround in vacancies. Increased in-migration of persons aged 19-24 has also helped bolster demand.

## Survey Results

Following three years of consecutive increases, apartment vacancies across Metro Edmonton have declined due to a pullback in rental apartment completions and improved demand associated with rising in-migration of younger persons into the region. Out of a universe of 66,057 units, CMHC found 2,943 units vacant and available for rent, representing a 16 per cent

decrease from the 3,502 vacant units identified in the October 2004 survey. The total universe of rental apartments increased by a modest 25 units following a 299 unit decline in the 2004 rental universe. While new construction (see Chart 2) is continually adding units to the rental universe, condo conversions are undermining these efforts. On the flip side, condominium construction levels have remained very strong across Edmonton in the past year and a number of these units have been purchased by investors and then injected into the secondary rental market. These investor units represent hundreds of new rental apartments competing in the market place for tenants and thereby impacting the vacancy rates of existing rental buildings.
Overall, apartment vacancies across the Edmonton region declined by 0.8 percentage points from last October to an average of 4.5 per cent. Onebedroom units accounted for the biggest decline by unit type, dropping by I.I percentage points to an average of 4.1 per cent. Bachelor suites and units with three or more bedrooms also reported vacancy rates of 4.1 per cent this October, but these numbers were not markedly different from what our survey found in October 2004. Two-bedroom units experienced a decline that, at 0.8 percentage points, matched the overall downswing in the rental market. However, at five per cent, vacancies in two-bedroom units remained the highest among all apartment types.
Table I.I.I provides the breakout of vacancy rates by survey zone and unit type across Metro for this October compared with last year's results. As was the case in 2003 and 2004, the two districts with the lowest vacancy rates in this year's survey were Zones 3 (University) and I3 (St.Albert). Zone II (Northeast) experienced the largest increase in vacancies and also reported the highest vacancy rate among all districts. This resulted from a large injection of new rental apartments into the area during the
past year. The biggest decline in vacancies was reported in the suburban communities of Zone 14 (2.9 percentage points) followed by Zones 5, 8, and 9, which all reported downswings of 2.5 percentage points.
Table I.2.I provides apartment vacancy statistics by year of construction and bedroom type. As was the case last year, vacancies remain the highest in newer buildings constructed since 1990. The newer buildings were also the only group to see vacancies go up from last year.
Chart 3 illustrates the trend in apartment vacancy rates by structure size. The highest vacancy rates were

found in the two smallest size categories of 3-5 and 6-19 units. The lowest vacancies ( 3.5 per cent) were found in the 50-99 unit category, which also reported the biggest decline in vacancies, at I.I percentage points. The largest structure size of 100+ units was the only category to report a rise in vacancies but the overall rate remained below the Metro-wide average. The numbers are provided in detail in Table I.3.I.
Chart 4 shows the three-year history for apartment vacancy rates by rent range. Vacancies were higher than average among the structures renting for less than $\$ 600$ per month. The only category to experience an increase was the lowest priced units of under $\$ 400$ per month. Vacancies were highest in the \$400-499 rent range while the market was tightest in the \$700-799 range, which also experienced the biggest decline in vacancies of 1.3 percentage points. Table 1.4 delivers the results by bedroom type.

## Availability Rates Fall

The availability rate for apartments across Metro fell to 5.7 per cent in this year's survey compared with 6.9 per cent in October 2004 (see Table I.I.4). A rental unit is considered available if the unit is vacant, or the existing tenant has given or received official notice to move and a new tenant has not signed a lease. As the definition of availability includes vacancy, the availability rate will always be equal to or greater than the vacancy rate. Similar to the vacancy survey, the highest availability rates were reported in Zone II (II. 2 per cent). The Northeast also saw the biggest increase in the availability rate at 4.6 percentage points. Other areas with high availability rates included Zones 6 and 2 with rates of 9.4 and 8.1 per cent, respectively. The popular Zone 3 (University) was the only area of Metro with an availability rate of under three percent.

## Apartment Rents Increases Remain Modest in 2005

With the rental market starting to tighten again in 2005, landlords have responded by inching rents upward. However, many property owners are also concerned about the high cost of turnovers in a market place that is still very competitive. As such, overall rent increases have remained modest in relation to rising operating costs. Following a I. 2 per cent (eight dollars per month) increase recorded in last year's survey, apartment rents across the region increased this year by only 1.4 per cent or nine dollars per month.

The strongest gains in rent levels were reported in the bachelor and one-
bedroom categories, where rents rose on average by 1.8 per cent. The weakest increases occurred in twobedroom units where vacancies remain higher than average. The typical rent for a two-bedroom unit rose by only two dollars per month to an average of $\$ 732$. Rents in larger apartments of three or more units increased by 1.2 per cent or $\$ 10$ per month to an average of $\$ 814$.
Table I.I. 2 provides the details on average apartment rents by bedroom type and survey zone. For onebedroom units, rent increases were strongest in Zone 3 (four per cent), followed by Zones 10 and 14 with annual increases of 3.5 and 3.1 per cent, respectively. The highest onebedroom rents were reported in Zones 6 and 7, with both districts averaging $\$ 665$. The largest rent increases in two-bedroom rents, at three per cent, occurred in Zone 14 where vacancies have fallen the most in the past year. Despite a 1.9 per cent decline from last year, two-bedroom average rents remained highest in Zone 3 (\$840).

## Incentives Decline Along With Vacancies

With apartment vacancies heading downward in 2005, fewer landlords are offering incentives to prevent turnovers or lure new tenants into their buildings. Incentives include benefits such as one month free rent, extra appliances, free cable TV or highspeed internet, or two-year leases. As shown in Chart 6, incentives offered by landlords fell to 19.1 per cent of structures surveyed, from 28 per cent in October 2004. With vacancies forecast to drop below four per cent
next year, incentives will continue to disappear as a marketing strategy for many property managers in the months ahead.

## Row Vacancy Rates Decline

Similar to the results in this year's survey of rental apartments, vacancies in Edmonton's row/townhouse rentals have also turned the corner and moved lower this year. As shown in Chart 7, the overall vacancy rate in row units across Metro fell from four per cent last October to 3.3 per cent this fall. Declines were largest (two percentage points) among onebedroom units but these represent a very small proportion of the total row universe (see Table 2.I.3). Vacancies were lowest, at three per cent, in twobedroom units. With few row rental units under construction this fall, expect further declines in the townhouse vacancy rate in 2006.
The availability rate for row units, reported in Table 2.I. 4 stood at 4.6 per cent this October. Since this is our first year for measuring availability statistics in row units, there are no comparable statistics for 2004.

## Row Rents Move Higher

With townhouse vacancies moving downward this year, landlords have been able to garner small rent
increases. Following a 0.7 per cent decline in 2004, the overall average rent levels for all row units increased by 0.9 per cent or seven dollars per month to $\$ 793$. Table 2.1. 2 provides the breakout for townhouse rents by bedroom type and zone. Rent gains were strongest among one-bedroom townhouses, with increases of 3.6 per cent ( $\$ 22$ per month) to an average of $\$ 634$. Two-bedroom units experienced increases of I.I per cent, on average, while the larger units with three or more bedrooms rose by only 0.4 per cent or three dollars per month to an average of $\$ 793$.

## RENTAL MARKET OUTLOOK

## Rental Apartment Market Tightens in 2006

In 2004, apartment vacancies across the Capital Region reached the highest point in eight years due to a combination of high multi-family completion levels in previous years and record levels of home buying activity. This year, the strong home buying activity has continued but a pullback in rental apartment completions has allowed vacancy rates to turn the corner. Stronger inmigration, particularly among the key 19-to-24 year-olds, has also helped to boost demand for rental accommodation. In 2006, we expect apartment vacancies across the region to further decline to near 3.8 per cent in response to firm demand and a continued pullback in new supply.
In 2006, home ownership costs are again expected to climb much faster than rents due to a combination of rising house prices, increases in mortgage rates and higher utility costs. Chart 8 shows the rising gap between the cost of renting an apartment and owning similar accommodation, not including condominium fees. Increasing condominium prices combined with rising mortgage rates are causing the carrying costs (PIT) of a typical apartment to become substantially more expensive than renting an apartment in Edmonton.

With this upward trend expected to continue next year, the rising gap should help stem the losses of tenants that landlords have been experiencing when these individuals tenants exit to become homeowners. In-migration and job creation numbers are expected to improve over this year and this will also help to underpin demand for rental units.
On the supply side, weaker rental apartment starts this year will translate into fewer completions in 2006 and this will also cause vacancies to trend downward below four per cent. The economics of rental unit construction have altered recently and this will impact the number of new projects launched in 2006. The cost of constructing apartments, both woodfame and concrete high-rise, has been accelerating in the past year while growth in market rents has slowed. Operating costs have also taken off and this has undermined the attractiveness of these investments relative to other financial assets. A number of rental properties built in recent years have also converted to condominiums, and this will also reduce the supply of rentals on hand in 2006. This said, there was still a high volume of apartments under construction this fall, albeit mostly condominiums, and new units entering the market will remain in relatively good supply.This will prevent any major downswing in vacancies over the forecast period. While rental unit completions will be down next year, the numbers will be augmented by a large number of new condominiums that will be purchased by investors and injected into the secondary rental market.

## Rents Move Higher In 2006

With vacancies expected to remain on the downtrend in 2006, property owners will be looking for bigger rent increases than they typically passed on to tenants in 2004 and 2005. Rents were rising rapidly during 2001 and 2002 when markets were tighter but tapered off in recent years as conditions became more competitive. Rising operating costs associated with

utilities, insurance, taxes and building maintenance have been taking a huge bite out of net operating incomes and property managers will be under pressure to raise revenues. However, with overall vacancy levels just under four per cent next year, many landlords will still be reluctant to raise rents substantially due to the impacts of turnovers on operating costs. Look for rent increases of close to 2.3 per cent in 2006, which should translate into a $\$ 15$ per month rise for the average tenant compared with a nine dollar increase this year.

## NATIONAL OVERVIEW

National Apartment Vacancy Rate Stabilizes

The average rental apartment vacancy rate in Canada's 28 major centres' was unchanged at 2.7 per cent in October 2005 compared to last year. This follows three consecutive increases in the vacancy rate over the 2002 to 2004 period. The vacancy rate remains below the average of 2.8 per cent observed over the 1995 to 2004 period.
Thanks to a solid economy and strong job creation, household formation has been healthy, which has promoted demand for both ownership and rental housing. The stabilizing of the vacancy rate across the major centres reflects a number of factors. As the majority of new immigrants initially settle in rental housing, high levels of immigration have been a key driver of rental demand over the past year. Also, across most centres, more renters are remaining in rental units as the gap between the cost of home ownership and renting increased in 2005. These two factors have put downward pressure on vacancy rates over the past year.
On the other hand, home ownership demand remained very strong, which can be seen from the record level of existing home sales in 2005. Strong home ownership demand continues to apply upward pressure on vacancy rates. Adding to this is the high level of condominium completions in some centres. Condominiums are a relatively inexpensive form of housing that are often purchased by renter households switching to home ownership. In some cases, condos supplement the rental market as they may be purchased by investors who, in turn, rent them out. Therefore, high levels of condominium completions have created competition for the rental market and have put upward pressure on vacancy rates.
Even though the average rental apartment vacancy rate has moved
higher in recent years, many households are still facing affordability issues across Canada. Either these households need to move to less expensive units or require additional help to make their monthly shelter costs more affordable. In some cases, however, there are not enough vacant units to meet the needs of all households in core housing need. Therefore, additional affordable housing units continue to be required. The centres with the highest vacancy rates in 2005 were Windsor (10.3 per cent), Saint John (NB) (5.7 per cent), Saskatoon (4.6 per cent), Thunder Bay (4.6 per cent), Edmonton (4.5 per cent), St. John's (NFLD) (4.5 per cent), and Saguenay ( 4.5 per cent). On the other hand, the major urban centres with the lowest vacancy rates were Victoria ( 0.5 per cent), Sherbrooke ( 1.2 per cent), Québec ( 1.4 per cent), Vancouver (l. 4 per cent), TroisRivières (1.5 per cent), Calgary (I. 6 per cent), and Greater Sudbury (I. 6 per cent).
Average rents for two-bedroom apartments increased in 25 of the 28 major centres. However in 15 of the 25 major centres where rents were up, the increases were small. The greatest increases occurred in Kitchener,Victoria, and Quebec where rents were up 6.0 per cent, 4.8 per cent, and 4.2 per cent, respectively. Overall, the average rent for twobedroom apartments across Canada's 28 major centres increased by 1.6 per cent in October 2005 compared to last year.
The highest average monthly rents for two-bedroom apartments were in Toronto (\$1,052), Vancouver (\$1,004), and Ottawa (\$920), while the lowest were in Trois-Rivières (\$474) and Saguenay (\$472).

## Zone Realignment and Census Tract Revision

For a number of centres, the zones were realigned to better match existing neighbourhoods (see zone descriptions) and, in some cases, the zones were renumbered. At the same time, the census tracts, which make up the zones, were revised to make them correspond to the 2001 census boundaries (as determined by Statistics Canada). The result of these two actions is the following: the universe size, the vacancy rate and the average rent reported for year 2004 in the 2004 rental market publications may be different from the year 2004 numbers reported in the 2005 reports.

## METHODOLOGY

Canada Mortgage and Housing Corporation (CMHC) conducts the Rental Market Survey (RMS) every year in October to estimate the relative strengths in the rental market. The survey is conducted on a sample basis in all urban areas with populations of 10,000 and more. The survey targets only structures with at least three rental units, which have been on the market for at least three months. The data collected for a structure depends on its initiation type (public or private), and whether it is an apartment or a row structure. The survey collects vacant unit data for all sampled structures. The market rent data are collected for only privately initiated structures. The available unit data are obtained only for privately initiated apartment or row structures. Most data contained in this publication refer to privately initiated apartment structures.

The survey is conducted by a combination of telephone interviews and site visits, and information is obtained from the owner, manager, or building superintendent. The survey is conducted during the first two weeks of October, and the results reflect market conditions at that time.

## Definitions

Availability: A rental unit is considered available if the existing tenant has given, or has received, notice to move, and a new tenant has not signed a lease; or the unit is vacant (see definition of vacancy below).

Rent: The rent refers to the actual amount tenants pay for their unit. No adjustments are made for the inclusion or exclusion of amenities and services such as heat, hydro, parking, and hot water. For available and vacant units, the rent is the amount the owner is asking for the unit.

It should be noted that the average rents reported in this publication provide a sound indication of the amounts paid by unit size and geographical sector. Utilities such as heating, electricity and hot water may or may not be included in the rent. The changes in average rent do not necessarily correspond to rent changes within a given structure. The increase or decrease of the average rents between two years may or may not be statistically significant due to other factors such as the variability of the rents.

Rental Apartment Structure: Any building containing three or more rental units, of which at least one unit is not ground oriented. Owner-occupied units are not included in the rental building unit count.

Rental Row (Townhouse) Structure: Any building containing three or more rental units, all of which are ground oriented with vertical divisions. Owner-occupied units are not included in the rental building unit count. These row units in some centres are commonly referred to as townhouses.

Vacancy: A unit is considered vacant if, at the time of the survey, it is physically unoccupied and available for immediate rental.

## Definitions of Census Areas referred to in this publication are as follows:

A census metropolitan area (CMA) or a census agglomeration (CA) is formed by one or more adjacent municipalities centred on a large urban area (known as the urban core). The census population count of the urban core is at least 10,000 to form a census agglomeration and at least 100,000 to form a census metropolitan area. To be included in the CMA or CA, other adjacent municipalities must have a high degree of integration with the central urban area, as measured by commuting flows derived from census place of work data. CMAs and CAs contain whole municipalities or Census Subdivisions.

All data presented in this publication is based on Statistics Canada's 2001 Census area definitions.

## Acknowledgement

The Rental Market Survey could not have been conducted without the cooperation of the rental property owners, managers and building superintendents throughout Canada. CMHC acknowledges their hard work and assistance in providing timely and accurate information. As a result of their contribution, CMHC is able to provide information that benefits the entire housing industry.
