Note of Appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

Overview

2002 to 2005 (revised)

Economic growth in Western Canada outpaced the national average in 2005, while activity east of the Manitoba-Ontario border waned.

Nationally, real gross domestic product sat at 2.9% in 2005, just off its 2004 pace (+3.3%). High natural resource prices, good growing conditions and strong foreign demand bolstered output in Manitoba, Saskatchewan, Alberta and British Columbia

Real gross domestic product, 2005

Alberta led the provinces for the second consecutive year, increasing 4.6% in 2005. Strong oil prices and foreign demand triggered the growth that rippled throughout Alberta's economy. Activity in the energy sector stimulated demand for related machinery and equipment from manufacturers in Saskatchewan and Alberta. Meanwhile, the influx of workers increased demand for services.

In Atlantic Canada, Quebec and Ontario, strong labour income boosted consumer demand and kept residential construction at or near historic highs. In Quebec and Ontario this growth was tempered by a manufacturing sector which was hit by rising fuel costs and increased foreign competition.

In Newfoundland and Labrador production problems on the Terra Nova and Hibernia oil platforms stalled growth for the second year in a row. Growth rates for real GDP in the provinces and territories have been revised from 2002 to 2005. Overall, the picture of economic growth remained the same, but 2005 growth rates were revised up in five jurisdictions: Prince Edward Island, Nova Scotia, Alberta, British Columbia and the Yukon. Growth in Newfoundland and Labrador, Quebec, Ontario and Manitoba remained unchanged. Rates for New Brunswick, Saskatchewan, the Northwest Territories and Nunavut were revised down.

Four-year snapshot: Growth shifts from east to west

Between 2002 and 2005, Canada's economy increased at an annual average rate of 2.7%. The shift in the source of this growth is notable. In 2002, much of the growth was driven by investment and manufacturing in the eastern half of the country.

In 2003 to 2005, as energy and other commodity prices began to increase, the stimulus for national growth shifted west. The oil-patch in Alberta, Saskatchewan's wheat fields and mines and British Columbia's forests profited from increased export demand and provided the impetus for Canada's growth.

Commodity prices stimulate growth in Western Canada

Saskatchewan, Alberta and British Columbia all realized output increases at or above the Canadian average for the last three years.

In Alberta, the surge in oil prices of the last two years has led to heightened activity in the oil-patch. As oil prices rose in 2004 and 2005, the development of the oil sands in northern Alberta hit its stride and brought with it new workers, increased labour income, new demand for housing and increased demand for oil-patch related machinery and equipment. The influx of workers strained the infrastructure of the province, and construction of homes and other buildings soared.

Growth in Saskatchewan was broad based. Strong foreign demand contributed to higher exports of potash and fertilizer. As well, crop production recovered from a drought plagued 2002. Saskatchewan's oil-patch, albeit much smaller than Alberta's, struggled in volume terms, but the healthy prices ensured ongoing profitability and corporate profits grew apace.

British Columbia, meanwhile, rode the tide of heightened residential construction in North American markets and supplied wood products for Canadian and U.S. home builders alike. Forestry growth was particularly acute in 2004 as the industry attempted to get timber to market ahead of a pine beetle infestation. Investment growth was strong with home building experiencing double-digit growth in three of the last four years.

Manitoba has lagged behind the western provinces, almost reaching the Canadian average in 2005, when a combination of strong employment and high electricity exports lifted output.

Manufacturing heartland squeezed

The same commodity prices that benefited Western Canada hampered production in Quebec and Ontario. Their export driven economies felt the pinch of a rising Canadian dollar and the impact of higher fuel costs. Manufacturing fell in 2002 and 2003 in Quebec, and in 2003 and 2005 in Ontario.

There were bright spots with Quebec's aerospace industry partly recovering from the impact of the terrorist attacks of September 11, 2001. Demand for the cars and trucks being produced by Ontario remained strong, but overall, both provinces lagged behind the national average for the last three years.

Economic activity in Eastern Canada slows

In Atlantic Canada, the oil and gas sector in Newfoundland and Labrador and Nova Scotia brought economic growth to both provinces in 2002. However, more recently, the Terra Nova and Hibernia platforms in Newfoundland and Labrador have had their share of mechanical difficulties. Overall economic growth in the province has stalled at 2003 levels.

In Nova Scotia, natural gas production gave a lift to 2002, but the economy has not managed to meet the Canada growth rate since then.

In Prince Edward Island, once an agricultural economy, food processing and aerospace have now taken an increasingly important role, adding to labour income and exports and pushing average growth over the four year period to 2.8%, just ahead of the Canada average.

New Brunswick, still heavily reliant on forestry and downstream wood and paper products, has more recently benefited from infrastructure improvements and has seen advances in petroleum refining and transportation. New Brunswick fell behind the Canada average with a four year average of 2.4%.

Territorial results mixed

Northern Canada has profited greatly from its resources over the last few years. In the Northwest Territories, diamond mining now accounts for approximately half of territorial output and has boosted its four year average growth to more than triple Canada's.

In the Yukon, government expenditures account for almost half the territorial GDP. Infrastructure investment has helped bolster the territory, and exploration of resource assets continues. Growth in Nunavut has averaged 0.9% over the last four years, but a new diamond mine augers well for 2006.

Note to readers

This release of provincial and territorial economic accounts is an update of the estimates released on April 26, 2006. The Input-Output benchmarks of 2002 (revised) and 2003 (preliminary), the revisions to the national Income and Expenditure accounts released in May 2006 and improved data sources and methodologies make up the basis of this update. These changes affect both the provincial GDP by income and expenditure and the provincial GDP by industry from 2002 to 2005.

Percentage changes for expenditure-based and industry-based statistics (such as consumer expenditures, investment, exports, imports, production and output) are calculated using volume measures, that is, adjusted for inflation. Percentage changes for income-based statistics (such as labour income, corporate profits and farm income) are calculated using nominal values, that is, not adjusted for inflation.

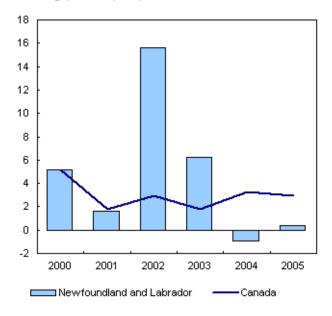

Highlights by province

Newfoundland and Labrador

Mining supports growth

The Newfoundland and Labrador economy edged forward in 2005 (+0.4%) following the contraction in 2004 (-0.9%). Activity was well off the torrid pace set in 2002 and the strong growth registered in 2003. The decline in the oil and gas sector served to restrain growth in the last couple of years.

Newfoundland and Labrador's GDP

% change, chained (1997) dollars

After having driven the economy in 2002 and 2003, production problems plagued Newfoundland and Labrador's oil and gas industry in 2004 and 2005. Output in the oil and gas industry retreated again in 2005, as oil production was down at both the Hibernia and Terra Nova oil fields. Nevertheless, the high price of oil translated into sustained healthy corporate profits.

Mining bounced back from a strike-plagued 2004, bolstered by the commencement of activity at the Voisey's Bay nickel-copper-cobalt mine in 2005. Services to mining and drilling recovered ground lost in 2004. After an unusually strong performance in 2004, the fishing industry was hit hard in 2005, largely due to a delayed crab season, lower prices and the impact of tariffs on shrimp exports to the European Union.

Following two years of double-digit growth, business investment took a breather in 2005. This reflected the significant impact on machinery and equipment spending of two maturing mega construction projects (the White Rose floating production, storage and offloading vessel and the Voisey's Bay mining project), now both completed. However, non-residential building construction was supported by a rebound in government capital spending.

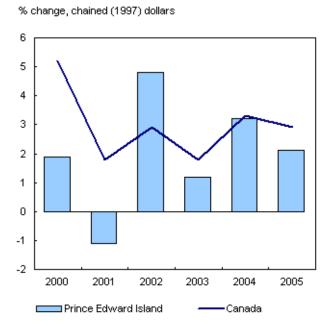

Growth in consumer spending closely followed the pattern of disposable income over the last few years. Though personal consumption expenditure strengthened slightly in 2005, it was well off the national average. However, purchases of consumer durables, specifically new motor vehicles, rebounded.

Prince Edward Island

Growth eases as agriculture falters

Economic activity eased in Prince Edward Island in 2005 (+2.1%), as output declined in agriculture (-9.1%). Strength in manufacturing and service industries supported growth.

Prince Edward Island's GDP

Crop production languished as the potato harvest fell almost 15%, reflecting fewer acres planted. This was a far cry from the agriculture-led boom in 2002, when farmers benefited from relatively better conditions. Though weaker than the robust growth in 2004, manufacturing advanced strongly (+5.0%), reflecting the contributions by transportation equipment manufacturers, such as shipbuilding and aerospace manufacturers, and frozen food manufacturing. Service industries (+2.5%) also supported the economy.

Consumer spending accelerated in 2005 (+2.6%), but remained well below the national average. Spending on durable goods grew significantly in 2005, mostly on the strength of new automobile purchases. Business investment slowed significantly in 2005 as investment in residential and non-residential construction both registered declines. This drag was partly offset by a jump in government capital spending.

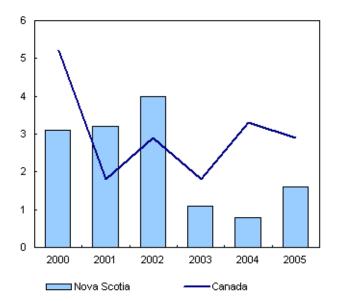

Nova Scotia

Economy moves forward, led by strong investment on machinery and equipment

The Nova Scotia economy picked up steam in 2005 (+1.6%), but was well below the boom years prior to 2003. Growth in Nova Scotia has also been well below the national average since 2003.

Nova Scotia's GDP

% change, chained (1997) dollars

Business investment in machinery and equipment (+18%) accounted for a large part of economic growth in 2005, reflecting increased expenditure in the refinery and petroleum, telecommunication and air transportation industries. However, investment in non-residential structures fell substantially for the second consecutive year.

Although residential construction started to cool across most of Canada, investment in residential structures was still strong in Nova Scotia (+4.0%), which translated into higher output for real estate agents and legal industries. While services strengthened, manufacturing declined. Textiles, transportation equipment, rubber and plastic products were all off their 2004 levels.

Corporate profits benefited from higher natural gas prices, posting a third consecutive year of double-digit growth. Nevertheless, results from the primary industries were mixed. Agriculture grew sharply over last year largely due to robust aquaculture results. Mining declined and oil and gas rebounded. Fishing, affected by dwindling fish stocks and poor weather, registered a drop on the heels of a near double-digit decline the previous year.

Labour income jumped, led by wages and salaries in the services producing industries. The gain in labour compensation helped boost consumer expenditure on durable goods, such as automobiles. Nevertheless the pace of spending, especially on consumer goods, remained well below the national average.

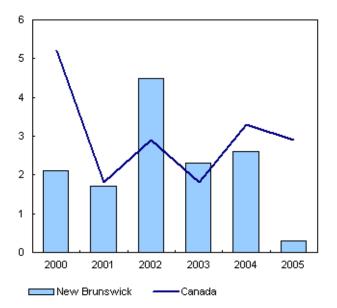

New Brunswick

Hit hard by weak forestry sector and sharp decline in manufacturing

Economic growth essentially ground to a halt (+0.3%) in 2005, well below last year's pace of 2.6%. Goods producing industries—representing approximately thirty percent of the province's output—declined 2.9%.

New Brunswick's GDP

% change, chained (1997) dollars

Manufacturing suffered a sharp decline, the weakest performance across the country. Paper manufacturing, which represents approximately a quarter of the province's manufacturing sector, was rocked by a series of mill closures as exports of wood based products to the United States slumped. The weak demand for New Brunswick paper impacted the forestry and logging industry which also saw output drop. Truck transportation also lost ground as fewer goods were brought to the market. The net effect of these developments helped drive down corporate profits 5.8%.

The service sector continued to expand. The finance, insurance and real estate industry and the retail industry were key to growth again this year. Service sector employment offset the significant loss of jobs in manufacturing. Labour income weakened, posting the lowest growth in Canada (+3.5%). Similarly, consumer spending was well off the national average as sales of new motor vehicles declined for the third straight year.

Two bright spots were government spending and business investment. The recent health accord between the federal and provincial governments coincided with increased output of health care services which grew 1.6%. Business investment in machinery and equipment was up strongly again, though at less than one-half the pace set in 2004, and investment in non-residential structures rebounded from the 20% decline in 2004.

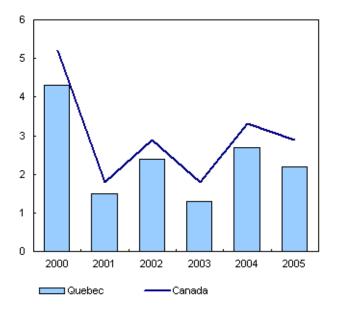

Quebec

Lower growth reflects weakness across a number of industries

Economic activity in Quebec slowed (+2.2%) in 2005. Strength in trade, finance and professional services was more than offset by a slowdown in construction and public administration combined with pronounced declines in mining and forest products industries. This acted to constrain growth to about three-quarters of the national economic growth for 2005.

Quebec's GDP

% change, chained (1997) dollars

Non-residential and residential construction declined, making for the lowest rate of business investment in the country. While business investment was weak, investment by governments was up 9.3%, led by expenditure on machinery and equipment. However, strikes at the province's CEGEPs, public schools, universities and in the provincial government reduced output across the public service.

Manufacturing output remained steady (+0.4%), supported by higher production and exports of transportation equipment. The strong dollar and the removal of trade barriers for clothing and textiles were keenly felt as textile manufacturing fell and clothing production slipped for the fourth consecutive year. The slowdown in construction activity adversely affected producers of wood products. Paper producers also felt the pinch of weakened world demand for paper as total paper manufacturing output fell. The mining industry also took a big hit, metal mining in particular, in the wake of a number of mine closures.

Wholesale and retail trade were both up in 2005, the latter supported by sustained consumer spending. Personal saving declined sharply in 2005, resulting in a saving rate that fell to 1.3%.

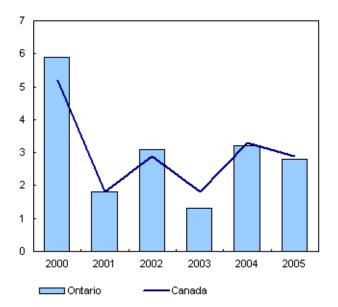

Ontario

Growth continues despite dip in manufacturing

Consistent with the pattern evident in recent years, economic activity in Ontario (+2.8%) kept pace with the national economy in 2005.

Ontario's GDP

Corporate profits declined marginally as manufacturers had to cut their profit margins in order to cope with the rising Canadian dollar, foreign competition and rising energy costs. As in all provinces east of Manitoba, the service industries—particularly wholesale trade and the finance industries—outperformed the goods producing industries.

Manufacturing activity dipped, as inventories accumulated. Both engine manufacturing and petroleum-petrochemicals industries were the hardest hit. The largest gains were in computer and communication equipment manufacturing. Production of passenger cars and light trucks edged up. Growth in exports resulted from of a substantial increase in automobile exports. However, exports of most other major groups tailed off, as foreign sales were well off the 2004 pace.

Residential investment registered its seventh consecutive annual gain, but slowed significantly as the housing boom lost steam. Business non-residential construction was down again while investment in machinery and equipment strengthened further.

Wholesale trade and retail trade remained strong. Consumer spending was buoyed by demand for durable goods, especially automobiles. This translated into about a 50% cut in personal saving, with the saving rate tumbling to 1.6%.

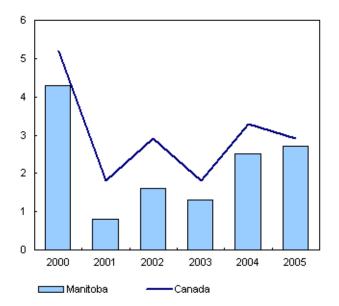

Manitoba

Investment and exports drive Manitoba's economy

The economy of Manitoba expanded (+2.7%), at about the same pace as 2004. Growth in 2005 was supported by investment spending, international exports of goods, as well as by strengthened retail and wholesale trade.

Manitoba's GDP

% change, chained (1997) dollars

Residential investment, though much cooler than in 2004, surpassed the national average. Business capital spending on non-residential structures strengthened, while growth in machinery and equipment registered a second year of double-digit growth.

In agriculture, animal production on farms increased and sales of pork helped sustain export growth. Offsetting this gain, the agriculture industry was devastated by excess rain in many districts, which led to a 25% plunge in crop production (in particular, canola, wheat, potatoes and barley) with exports falling in step. This, in turn, drove down farm incomes, as overall net farm income ended up in the red. The same rain that caused distress for Manitoba farmers helped power electric utilities to a 20% gain on the year. Manitoba set a new record for electricity exports in 2005 — primarily destined for the U.S.

For the third consecutive year, manufacturing output was weak, advancing 1.0%. Printing and chemical (especially pharmaceuticals) manufacturing fell off sharply.

Wholesale and retail trade enjoyed a banner year. Consumer spending advanced on strengthened durable goods expenditures (+6.1%), driven by strong sales of motor vehicles and of household furniture and appliances.

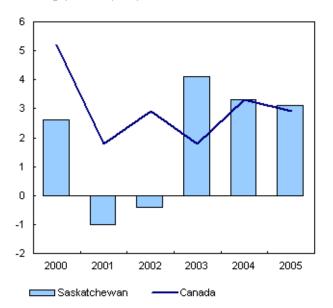

Saskatchewan

Strong crop production propels growth

Saskatchewan's GDP advanced 3.1% in 2005, just below the growth registered in 2004. Strength in final domestic demand and sustained global demand for natural resource-based products, combined with a bountiful harvest, provided stimulus to the economy.

Saskatchewan's GDP

% change, chained (1997) dollars

Crop production gained further ground, with the third consecutive year of double-digit growth as wheat and canola led the way. Near perfect growing conditions throughout the spring and summer were followed by a wet and cold harvest season, resulting in an abundant harvest for many crops, but with below average quality. These two factors, combined with a strengthened Canadian dollar, translated into lower prices, which drove down net farm income. Grain exports slowed in 2005, with much of the output ending up in inventories, continuing the strong buildup that began in 2003.

A second banner year for corporate profits reflected gains in both mining and manufacturing. The strong upward trend in energy prices has revitalized the demand for uranium, of which the province is endowed with high grade deposits. Potash production continued at a more moderate pace, supported by price gains. An increasingly diversified manufacturing sector posted a growth of 8.6% in 2005, building on the success of the previous year. Manufacturers of primary and fabricated metal products enjoyed another banner year, providing supplies to the bourgeoning oil sands developments in Alberta. Higher production of grain contributed to higher output of breakfast cereals. Manufacturers of meat products increased output in response to strong demand from Asia for pork products.

A strengthened residential housing market combined with a spike in spending on machinery and equipment explains in large part the advance in the construction industry (+4.0%). Labour income and consumer spending, especially on durable and semi-durable goods, both advanced strongly in 2005.

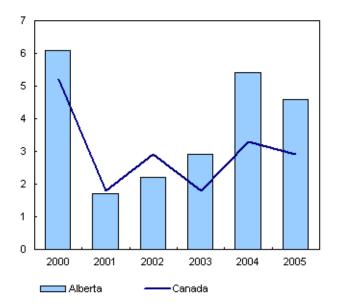

Alberta

Energy prices fuel growth

While soaring energy prices have contributed to much of the increase in nominal GDP in Alberta, it is the spin-off activities that produced the top economic growth (+4.6%) among the provinces, a position it has held for two years running.

Alberta's GDP

% change, chained (1997) dollars

Investment in construction of both new and existing facilities to extract and process the oil sands and in exploration activity shot up, in response to soaring natural resource prices. Nevertheless, the output of oil and gas was down slightly as the industry faced a number of challenges in bringing new production facilities on line. However, the higher energy prices and healthy corporate profits, combined with strong global demand for mineral fuels, attracted another wave of investment in exploration and development of oil and gas deposits in the province. Most manufacturers were swept along in the economic good times; in particular, industries that supply materials and machinery to the oil patch did very well. Investment in residential construction leapt 12%, almost four times the national average. In parallel, a strong re-sale market pushed up output of financial institutions and real estate agents. Many service industries benefited from strong spending by both businesses and consumers.

This pace of activity led to a shortage of labour in Alberta where the labour market continues to be the most robust in the country, with an unemployment rate sliding below 4 percent. This demand served to drive up labour income, as per capita income growth in Alberta was the highest among the provinces. Consumers took their increased income and spent it, mostly on big ticket items, as expenditure on durable goods posted a double-digit increase. Retailers across the spectrum enjoyed strong sales, particularly retailers of motor vehicles, furniture and household appliances and building supplies. Nevertheless, the personal saving rate edged up to 8.4%.

Crop and animal production advanced in 2005. Crop production increased 12%, as the harvest neared record levels, hampered only by a wet and cold harvest period. This affected the quality of the crops which, when combined with higher costs on the farm and weak prices, drove down net farm income. Animal production increased for the second consecutive year, as the livestock industry slowly recovers from the "mad cow" crisis.

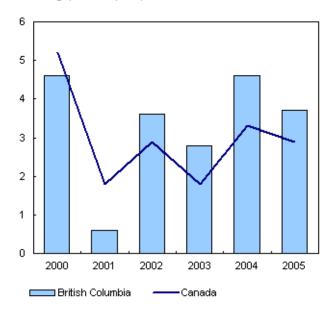

British Columbia

investment remains strong, pushing economy forward

British Columbia's economy cooled somewhat in 2005, but still managed the second highest rate of growth among the provinces (+3.7%), just behind Alberta. The unemployment rate continued to tumble, as strong final domestic demand provided support to the province's economy, despite slower growth in wood product and paper manufacturing.

British Columbia's GDP

% change, chained (1997) dollars

Business capital expenditure remained relatively strong as investment in machinery and equipment accelerated significantly (+17%). Investment in residential construction slowed, but still recorded the third best showing in the country. Government gross fixed capital formation also slowed, but remained strong, in part related to preparations for the 2010 Olympics.

Growth in personal expenditures was above the national average, led by increased spending on durable goods. Personal disposable income grew 5.2% despite higher growth in income taxes. However, the saving rate declined to -5.7%.

Corporate profits grew above the national average and were positively impacted by gains in the price of coal and natural gas. Forestry and logging activity decelerated sharply from 18.7% to 3.1%, as exports of lumber fell reflecting a cooling in the North American housing market. Output at pulp, paper and paperboard mills dropped as exports of wood pulp and newsprint paper also tumbled. Non-farm inventories accumulated as exports contracted.

Electric power generation, transmission and distribution surged partly in response to increased exports to the United States. Rail transportation climbed and truck transportation advanced, in response to increased exports and imports of goods with China at the ports, despite a strike at the Vancouver dockyards.

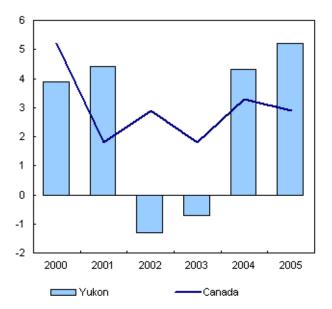

Yukon

Continued strength in the territory

After contracting in 2002 and 2003, Yukon's economy strengthened further (+5.2%) in 2005. Final domestic demand accelerated, with business investment leading the charge.

Yukon's GDP

% change, chained (1997) dollars

Business investment in non-residential construction and in machinery and equipment posted significant growth. Other engineering construction nearly doubled, and support activities for mining nearly doubled, as mineral exploration expenditures reached its highest level in nine years. Residential building construction remained strong.

Labour income climbed 7.3%, reflecting the increase in hours worked. The gains in labour income helped stimulate personal spending, which translated into strong growth in the retail trade sector.

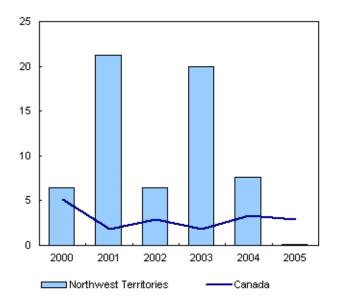

Northwest Territories

Growth slows considerably

The economy of the Northwest Territories slowed markedly (+0.1%) following five years of exceptional but varying growth. Economic activity was sustained by significant, though slower, investment-led final domestic demand. This was in sharp contrast to the export driven growth prior to 2004.

Northwest Territories' GDP

% change, chained (1997) dollars

Investment across all territories was remarkably strong in 2005, and the Northwest Territories was no exception. Investment climbed over 20% on the heels of an even stronger increase in 2004. The only thing putting the brakes on economic growth was a decline in diamond mining output (-3.6%), the first decline since the opening of the diamond mines. Nevertheless, the glitter of diamonds could still be felt throughout the economy, especially in investment and other mining support services, contributing to strength in the construction industry.

The lower output in the mining sector also had an impact on corporate profits which dropped substantially after more than doubling from 2002 to 2004. Growth in labour income remained strong, jumping 8.0%. Strength came mainly from construction. Services producing industries also posted solid gains with sharp increases in transportation and storage, finance, insurance and real estate and the professional services industries.

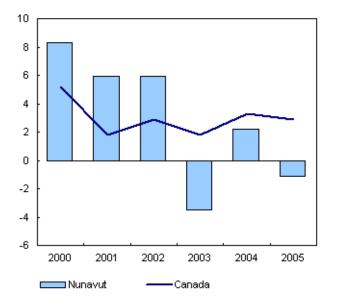

Nunavut

Economy continues to struggle

Nunavut's economy shrank in 2005 (-1.1%). Since the near complete shutdown of the mining industry in 2003, this small northern economy has struggled.

Nunavut's GDP

Government current expenditures on goods and services, which represent an overwhelming share of Nunavut's economic activity, slowed marginally in 2005. In addition, government capital spending fell off sharply as a number of major projects neared completion, or were completed, in 2005.

However, business investment in non-residential construction and in machinery and equipment took up part of the slack, with some of this occurring in the beleaguered mining sector, hit hard by closures the last number of years.

Investment in communications is also taking place with the development of a new satellite service, the largest in Canada. Labour income strength contributed to a 3.0% increase in retail trade, which also benefited from increased tourism from cruise ships.

About this publication

This publication presents an overview of recent economic developments in the provinces and territories. The overview covers several broad areas: 1) gross domestic product (GDP) by income and by expenditure, and 2) GDP by industry.

The publication examines trends in the major aggregates that comprise GDP, both income- and expenditure-based, as well as prices and the financing of economic activity by institutional sector. GDP is also examined by industry. Some issues also contain more technical articles, explaining national accounts methodology or analysing a particular aspect of the economy.

This publication carries the detailed analyses, charts and statistical tables that, prior to its first issue, were released in *The Daily* (11-001-XIE) under the headings Provincial Economic Accounts and Provincial Gross Domestic Product by industry.

Revision policy

GDP by income and by expenditure; GDP by industry:

Preliminary estimates are released in the spring following the end of the reference period, and revised in the fall of the same year. This latter release also comprises revisions to the three previous years. Estimates are not normally revised again except when historical revisions are carried out, usually once per decade. Statistical revisions are carried out in order to incorporate the most recent information from surveys, taxation statistics, public accounts, censuses, etc., as well as from the annual benchmarking process of the Input-Output Accounts.

Revisions in this issue

GDP by income and by expenditure; GDP by industry:

This release includes revisions from 2002. Also, the government detail tables have been updated to 2004.

Product information: Provincial Economic Accounts

The provincial and territorial economic accounts include estimates of the income and the expenditure based Gross Domestic Product (GDP), estimates of real GDP, contributions to percent change in real GDP, implicit price indexes and government detail tables. The government detail tables include revised revenue and expenditure data based on government public accounts.

Summaries by sub-sector of government (federal, provincial, local, CPP and QPP) are provided in tables 6 to 10. Revenue side category details are presented in Tables 11-13. Table 11 disaggregates direct taxes, social insurance contributions and transfers paid by persons to government. Table 12 presents the components of taxes on production and products by level of government, while table 13 lists the sources of government investment income by level of government. On the expenditure side, the major transfers to persons by type are presented in table 14 while subsidies and capital transfers, to both the personal and business sectors, can be found in table 15. Finally, table 16 lists the most important transfers by type between levels of governments.
