Note of appreciation

Canada owes the success of its statistical system to a long standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

Symbols

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0^s value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- p preliminary
- r revised
- x suppressed to meet the confidentiality requirements of the *Statistics Act*
- E use with caution
- F too unreliable to be published

Acknowledgements

billions of dollars

Analysis

Value of farm capital increased slightly in 2004

In 2004, Canada's farm capital value increased by 1.3% to \$201 billion, continuing a long upward trend which began in 1988. The total farm capital was 4.7% above the previous five-year average, from 1999 to 2003.

Ontario accounted for the largest increase in total capital value, rising by \$1.0 billion, while Nova Scotia recorded the only decrease of \$2.8 million.

The value of land and buildings, which accounted for 76.8% of total farm capital value, rose 2.4% from the 2003 level to \$154 billion. The total value of land and buildings was 7.8% above the previous five-year average. The value per acre for Eastern Canada and Western Canada averaged \$2,671 and \$632 respectively.

The value of machinery and equipment, which accounted for 16.9% of total farm capital, increased slightly to \$33.9 billion. The value of tractors, combines and other farm machinery, the largest component (80.2%) of the value of machinery and equipment, increased 0.2%, while trucks decreased 0.5% and autos decreased 1.1%. In 2004, the value of machinery and equipment was 2.8% above the previous five-year average.

The value of livestock and poultry, which accounted for 6.3% of total farm capital value, decreased 7.7% to \$12.6 billion. Cattle and calves, the largest component (82.7%) of the value of livestock and poultry, decreased 10.6% from 2003 to \$10.4 billion, and fell 25.1% below the previous five-year average as the consequences of bovine spongiform encephalopathy (BSE) continued to be felt. The value of pigs, which represented 13.4% of the total value of livestock and poultry, rose 16.1% from 2003 to \$1.7 billion, and was 20.8% above the previous five-year average. The value of poultry decreased 9.9% to \$315 million.

1. Valuing the on-farm inventories of livestock has proven challenging since May 2003 when trade restrictions imposed as a result of bovine spongiform encephalopathy (BSE) created uncertainty in all livestock markets. Please use this series with caution.

Note: The data in this table were last revised in November 2004 for 2001-2002 and in May 2005 for 2003-2004.

General information

This publication is part of a series of bulletins that also includes:

21-007-X	Farm product price index
21-010-X	Net farm income - Agriculture economic statistics
21-011-X	Farm cash receipts - Agriculture economic statistics
21-012-X	Farm operating expenses and depreciation charges - Agriculture economic statistics
21-014-X	Farm debt outstanding - Agriculture economic statistics
21-015-X	Direct payments to agriculture producers - Agriculture economic statistics
21-016-X	Balance sheet of the agricultural sector - Agriculture economic statistics
21-017-X	Agriculture value added account - Agriculture economic statistics
21-018-X	Farm business cash flows - Agriculture economic statistics

This publication includes 1981 to date estimates of the value of farm capital and its components, for the provinces and Canada at July 1 of each year.

All series can be obtained free on the internet at the Statistics Canada web site (www.statcan.ca). Notes on concepts and methods are also included for each data series.

Data from 1926 to 1980 inclusive are available in the November 2004 publication of **Value of farm capital - Agriculture economic statistics**, Catalogue no. 21-013-X, vol. 3, no. 2.

The electronic publication is first available in May. It includes preliminary estimates for the calendar year just ended. The following November, the publication is re-issued with revisions to the preliminary estimates. Revisions to the May issue can extend back two years, while those in November generally apply to three years. The date provided at the bottom of each table is the last time that a revision was made to that table.

Most data appearing in this publication are available through the Canadian Socio-Economic Information Management System (CANSIM), Statistics Canada's corporate computerized data base network and information retrieval service.

Statistics Canada is committed to ensuring that there is no disclosure of confidential material and therefore all data are subjected to restrictions prior to release.

Value of capital

Concepts

The value of capital estimates the market value of capital employed in the production of agricultural commodities, regardless of whether the capital is owned or leased. The three components of farm capital are: livestock and poultry, land and buildings, and farm implements and machinery.

The value of livestock and poultry estimates the market value of cattle, hogs, sheep, chickens, turkeys, mink and fox on farms. Based on the 2001 Census of Agriculture, the value of animals not included (horses, ponies, goats, rabbits, bee colonies, elk, buffalo, llamas, ostriches, etc.) is estimated to equal 8% of the published value of livestock and poultry. Horses and ponies account for 49% of the value of those not accounted for.

The value of land and buildings estimates the market value of real estate used for agricultural production. It includes the value of all property operated by the holding, whether owned or rented from others, but excludes the value of property rented to others. It also excludes the value of farm offices not located on farm holdings, even though they are assets used to produce agricultural products. The impact of this limitation on the data is considered to be insignificant.

The market value of all farm machinery and equipment on agricultural holdings is estimated, regardless of ownership. Separate estimates are made for autos, trucks and other farm machinery.

Methods and data quality

The numbers and values of the various components of farm capital are estimated each year, until the data become available from the succeeding Census. The estimates are then benchmarked to the Census and intercensal revisions are undertaken to adjust the estimates for the intercensal years.

The value of livestock and poultry is estimated for each province, based on farm inventories and average farm values per head for cattle, hogs, sheep, chickens, turkeys, mink and fox. Estimates of livestock numbers on farms as of July 1 are based on surveys of agricultural producers and are published in Statistics Canada's Catalogues: **Hog Statistics**, Catalogue no. 23-010-X, **Sheep Statistics**, Catalogue no. 23-011-X and **Cattle Statistics**, Catalogue no. 23-012-X.

For breeding livestock, the estimates of value per head for the different categories (bulls, milk cows, beef cows, milk heifers, beef heifers, boars, sows, rams, ewes and breeding lambs) are made by the Agriculture Division's Farm Income and Prices Section in consultation with provincial agriculture statisticians. Value per head for poultry and market livestock are based on market prices from administrative sources such as Agriculture and Agri-Food Canada and CanFax. The market prices reflect those received by producers at the point when ownership first changes hands. The value per head estimate uses the best data available and is deemed to be of acceptable quality.

The value of land and buildings is calculated by multiplying the value per acre of farm land and buildings by provincial estimates of the total area of land. The methods used to estimate value per acre are explained below.

Provincial estimates of the total area of land are made by multiplying the previous year's estimate by the annualized change in the total area of land between the two previous Censuses. This assumption is not unreasonable given the fact that the quantity of agricultural land is subject to only minor changes.

The values of automobiles and trucks are calculated for each province by multiplying the previous year's estimate by price and quantity change indicators. Year-over-year changes in the Farm Input Price Index (FIPI) for auto replacement and truck replacement, published by Prices Division, are used as provincial price change indicators.

The quantity change indicator for automobiles and trucks is the annualized change in numbers between the two previous Censuses.

The value of other machinery is estimated using a constant dollar, perpetual inventory model which accounts for investment and depreciation. Other farm machinery is valued at the aggregate level only, as the information needed to prepare estimates by type of farm machine is not available. Estimates of national investment are made by multiplying the previous year's estimate by a change indicator which is primarily derived from data on sales of farm machinery, excluding repair parts, by Association of Equipment Manufacturers (AEM) members. AEM is a coalition of most of the large manufacturers of farm machinery and implements, and of other associations that represent the industry. Imports minus exports, are also used as indicators in estimating national investment.

National investment is allocated provincially using proportions derived from the Census of Agriculture and the Farm Financial Survey. Depreciation is estimated as explained in the publication **Farm operating expenses and depreciation charges - Agriculture economic statistics**, Catalogue no. 21-012-X. Provincial FIPI for machinery replacement is used as the deflator to convert between constant and current values.

Investment is estimated using the value of all sales of farm machinery and equipment by manufacturers as a proxy, and may be underestimated because:

1. farmers may purchase used machinery and equipment from outside the sector; and
2. farmers may be making purchases of capital assets not classified as agricultural implements. Although the estimate includes the value of agricultural implements sold to non-farmers, such as cemeteries, parks, and commercial or private users, these sales outside the agriculture sector account for very little of the total sales, and the overall investment estimate is judged to be underestimated.

The preliminary change indicator for investment is based on the year-over-year change of the value of AEM members' sales, which does not include the value of smaller, specialized manufacturers who are not AEM members. This change is assumed to be equivalent to the year-over-year change of the industry's sales.

Valuing the on-farm inventories of livestock has proven challenging since May 2003 when trade restrictions imposed as a result of bovine spongiform encephalopathy (BSE) created uncertainty in all livestock markets. Please use this series with caution.

Value per acre of farm land and buildings

National and provincial estimates of the value per acre at July 1 are included in this publication for 1981 to date. These estimates are on the CANSIM database.

Value per acre of farm land and buildings reflects the value of all farm land, including pasture and unimproved land, plus the value of farm houses, buildings, and other structures.

The value of farm land per acre is estimated for each province by multiplying the previous year's estimate by the change ratios obtained from Farm Credit Canada's (FCC) survey of farm land values.

This FCC survey monitors bare land values in each province. Representative parcels of bare land are selected according to the most prevalent agricultural classes of soil in each Census district. Urban fringe areas are excluded from the sample. A weighting factor is then assigned to each of these properties, based on the improved land area from the most recent Census. Survey estimates are updated by FCC staff every six months, using the most recent comparable farm land sales.

This survey considers the value of the land, not the value of the buildings, which may introduce a bias into the indicators. In addition, the exclusion of urban fringe land may affect both the change in value and the level of the estimate, as urban fringe lands are more valuable, and also may be subject to more price volatility. Comparison to the 2001 Census of Agriculture indicates that the value of land and buildings was underestimated by 3.4%. This was particularly noticeable in Alberta, Quebec and Newfoundland and Labrador, which were underestimated by 9.7%, 6.1% and 6.1% respectively.

For more information about intercensal revisions, please refer to November 2003 of this publication **Value of farm capital - Agriculture economic statistics**, Catalogue no. 21-013-X, vol. 2, no. 2.
