Note of appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

Cattle estimates

January 1, 2005

Canada's national cattle herd continued to swell last year, reaching a record 15.1 million head as of January 1, 2005, a little over a year and a half after the worldwide ban on Canadian cattle because of mad cow disease.

According to the January Livestock Survey, Canadian farmers had 430,000 more cattle on their farms this year than they did on January 1, 2004. This was the equivalent of a 2.9% increase.

However, compared to January 1, 2003, before the ban was imposed, farmers had 1.6 million more head of cattle on their farms at the start of this year.

Livestock inventories at January 1						
	Cattle		Hogs		Sheep	
	'000 of head					
	2004	2005	2004	2005	2004	2005
Canada	14,660	15,090	14,623	14,675	997	980
Atlantic	296	296	366	356	34	33
Quebec	1,420	1,415	4,250	4,280	250	245
Ontario	2,224	2,189	3,670	3,610	270	265
Manitoba	1,450	1,510	2,852	2,870	82	70
Saskatchewan	2,855	3,040	1,265	1,342	125	130
Alberta	5,675	5,930	2,050	2,045	175	171
British Columbia	740	710	170	172	61	66

Note: Figures may not add up to totals because of rounding.

Survey results reflect the impact of a ban on Canadian cattle and beef following the disclosure of a single case of bovine spongiform encephalopathy (BSE), or mad cow disease, on May 20, 2003. The border remained closed to all Canadian beef exports until September 2003.

At that time, the United States, followed by a number of other countries, agreed to allow imports of Canadian boneless beef from animals younger than 30 months.

Subsequently, in December 2003, a dairy cow in Washington State, which was originally from Alberta, tested positive for BSE. The Canadian Food Inspection Agency confirmed two more cases of BSE in January 2005. The border is expected to be open to Canadian cattle as of March 2005.

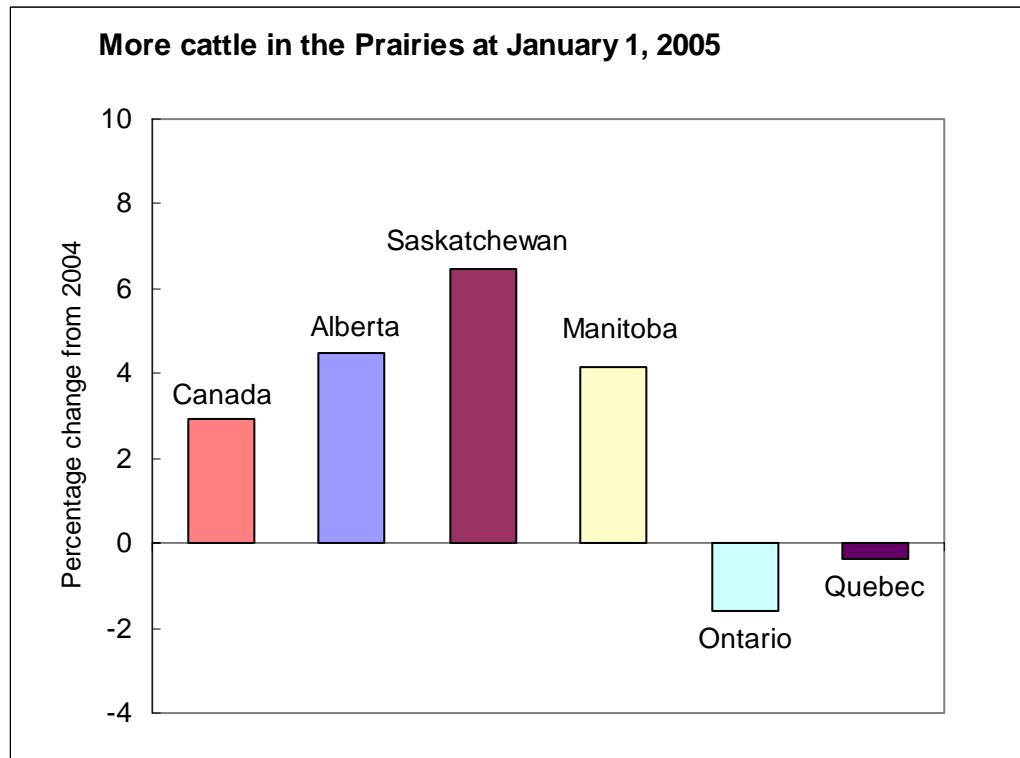

The survey of 10,000 producers also found that hog inventories rose marginally to 14.7 million head. Exports of live hogs to the United States were at record levels.

Cattle herd builds up in the Prairies

Herd sizes did not rise in all provinces, as increases in the Prairie Provinces were partially offset by declines in eastern Canada and British Columbia. As of January 1, 2005, Saskatchewan's herd was up 6.5% from the same time in the previous year, the largest increase.

Manitoba's herd was 4.1% higher while Alberta cattle inventories advanced 4.5% over the year. Alberta accounted for 39% of all cattle in Canada at January 1, 2005.

At the same time, inventories in Quebec dipped 0.4%, while Ontario's cattle herd fell 1.6%. British Columbia inventories declined 4.1%. The fact that some inventories were falling will be seen as a positive development by parts of the industry because of the US border closure to Canadian cattle.

Farmers reported increased levels of cattle on cow-calf operations, which are often small operations. Cow-calf farms are holding 5.6% more cattle this year than last and 16.9% more than two years ago.

As of January 1, 2005 there are 9.5 million head of cattle on cow-calf operations. The largest increases were experienced by Alberta and Saskatchewan, provinces where the inventories on cow-calf operations surged by 9.5% and 8.6%, respectively.

The number of beef cows on farms on January 1, 2005 stood at 5.3 million head, up 6.0% from a year ago. In times of expansion this news might be more welcome.

However, producers have reported that they are retaining cull cows because of the limited markets for these animals and poor prices. Some, but by no means all, of these animals that would have been culled if the market conditions were normal will calve in 2005.

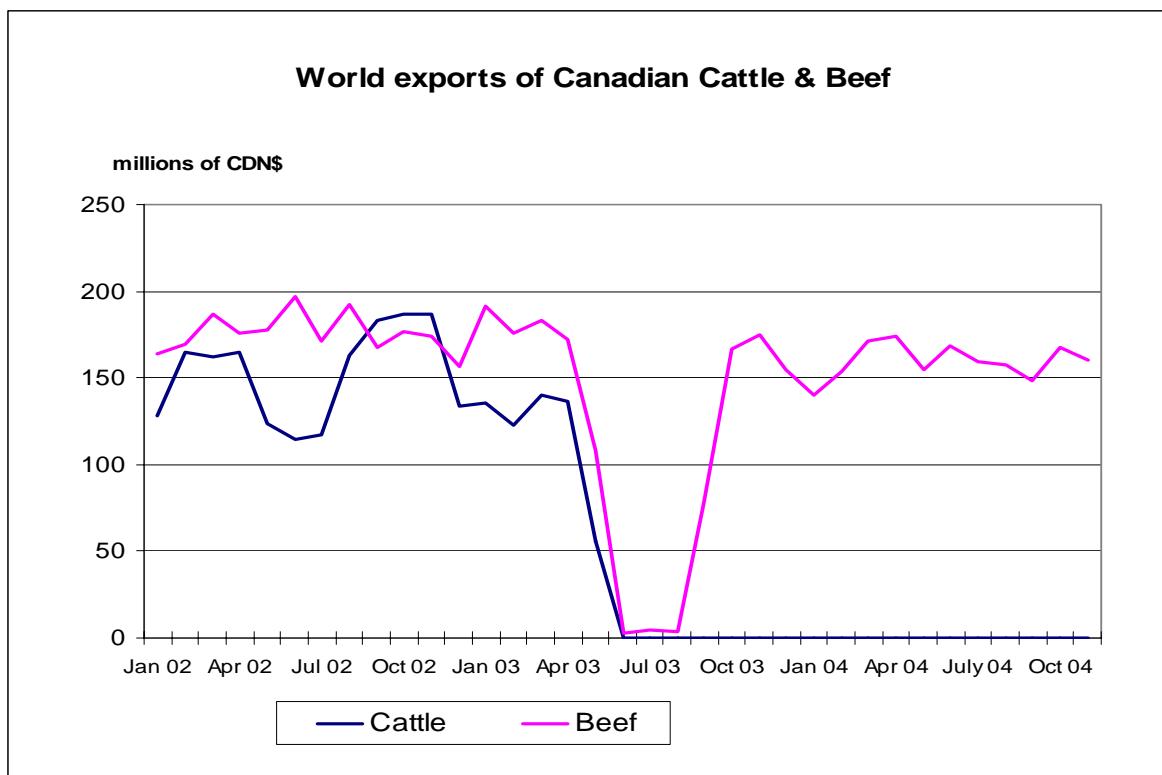

Plunge in exports following border closure

The BSE crisis has resulted in record numbers of cattle on Canadian farms. However, it has also crippled the nation's value of beef exports to the world.

In 2002, pre-BSE, total cattle and beef exports hit \$3.9 billion, the equivalent of \$11 million in sales each day.

By 2004, the value of these exports had plunged to only \$1.9 billion, less than half of the 2002 levels.

Trade has been a crucial factor for Canada's beef industry. Expansion in the industry during the 1980s coincided with freer trade, and was primarily driven by exports to the United States, Canada's largest trading partner.

By 2002, the Canadian cattle industry had expanded to the point where it was worth an estimated \$7.7 billion a year to farmers. Analysis illustrates that the accumulated impact of BSE on cattle farm cash receipts, from May 2003 to the end of 2004, was in the range of

\$5.3 billion. The losses to cattle producers were partially offset by BSE-related government payments that paid out \$1.4 billion from May 2003 to the end of September 2004.

A number of other factors have offset the plunge in exports.

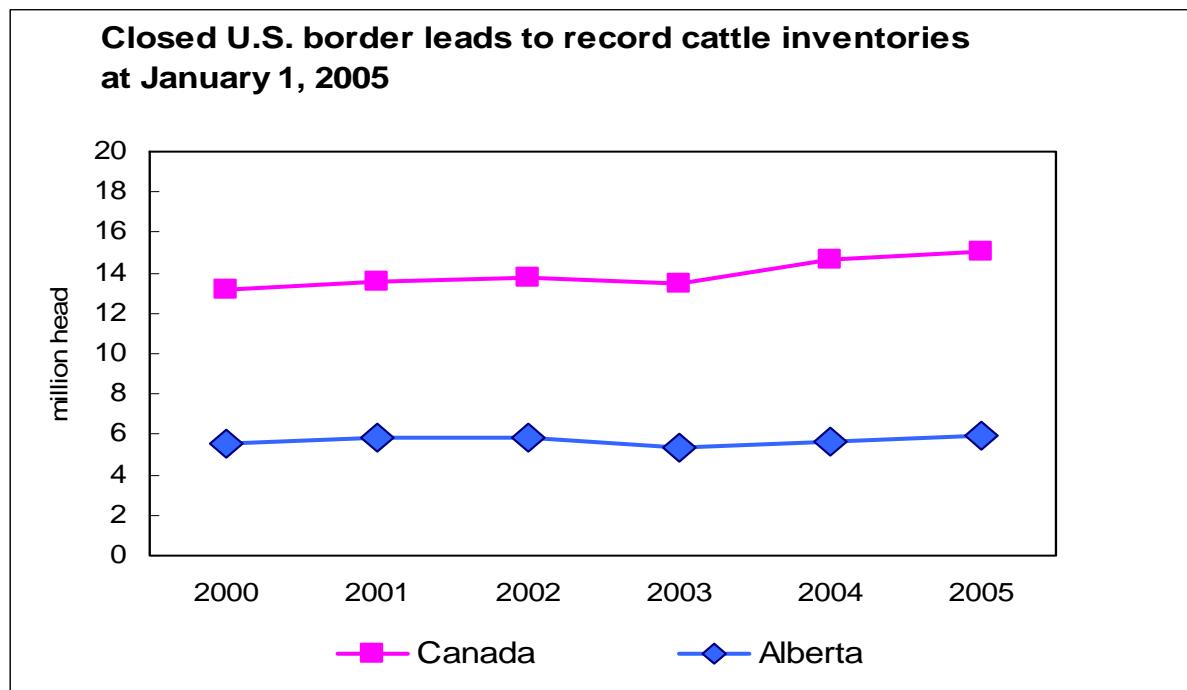

First, slaughter has climbed to record levels. In 2004, slaughter was 25.7% above 2003 levels and was 15.7% above those in 2002. These gains were fuelled by domestic demand, combined with lower levels of beef imports.

Generally, domestic consumption remained stable or declined between 1976 and 2002. However, in 2003, Canadians consumed 5% more beef than they did the year before.

Meanwhile, Canada has been importing less beef meat. Imports dropped quickly during the summer of 2003. During 2004, monthly beef imports averaged 7,600 tonnes - 70% below the pre-BSE levels.

At the same time, prices for all cattle – slaughter animals, feeders as well as calves – tumbled because of the domestic oversupply resulting from the plunge in exports.

Although they have improved since the months following the ban, slaughter prices during the fall of 2004 amounted to 73% of prices last seen in the spring of 2003.

Livestock Statistics – Concepts and Methods

Concepts

Inventory levels of the various types of livestock intended for sale in Canada are measured at specific times throughout the year. Surveyed operations are requested to include all animals located on the farming operation, regardless of ownership. They are also asked to include animals owned but pastured on a community pasture, grazing co-op or public land. Producers are asked to exclude animals owned but kept on a farm, ranch or feedlot operated by someone else. Inventory levels are estimated for cattle, calves, pigs, sheep and lambs. Estimates are also produced for certain categories of animals on the basis of age, sex, weight and/or purpose i.e. breeding or slaughter.

Current information on livestock inventories and related statistics such as supply and disposition enable those active in the agricultural sector to observe and assess changes in the industry, measure performance and keep the agricultural community and general public informed of developments. The primary data users are federal and provincial governments, producer boards, farmers and farm organizations, private business, academic research institutions and students. Livestock data assists governments in formulating agricultural policies and developing programs. Farming organizations use statistics in developing recommendations for producers and governments. Farmers make increasing use of prices, production, and marketing statistics in planning their operations. In addition, these livestock statistics are used in the calculation of farm incomes and in the Canadian System of National Accounts for indicators such as gross domestic product.

Methods

To produce livestock estimates, there are actually 6 different survey occasions. All of the survey occasions collect data primarily using Computer Assisted Telephone Interviews (CATI) although there are special procedures in place for the very large or complex operations.

Two of the occasions are the January Livestock Survey and the July Livestock Survey. These are large-scale general livestock surveys collecting data on cattle, hogs, sheep and other livestock, referring to inventories at the 1st of the month. The probability samples include about 10,000 operations at January 1, and about 28,000 operations at July 1. These surveys collect data during a three-week period in the western provinces, Ontario and Quebec. Regardless of when operators respond, they are asked to report inventories as of January 1 or July 1. The livestock survey results are released, following processing and analysis, approximately seven weeks after the reference date.

Hog inventories are the focus of two other survey occasions collecting estimates of pig numbers at April 1 and October 1. This survey was initiated in 1998 as estimates from 1978 to 1997 were based solely on analytical tools. For the hog surveys, a sub-sample of the prior livestock survey is used. The probability samples are 2,500 at April 1 and October 1 and, similar to the livestock surveys, these CATI surveys cover the western provinces, Ontario and Quebec. Producers are requested to report their inventories as of the reference date, although the data are collected during a 7-day period near or before that date. The hog survey results are normally released three to four weeks after the reference date.

The June and November Atlantic Surveys are used to produce estimates for that region. These surveys are multi-purpose collecting data, primarily inventories, on livestock including cattle,

hogs and sheep in addition to collecting data related to the area, yield and production of the principal field crops. The probability samples are 1,300 in June and 2,200 in November with the data collected by telephone. The results are released at the same time as the livestock results. For reference points where surveys do not exist for the Atlantic region, analytical tools are used to produce the estimates.

Recently a new piece of information has been added to the cattle statistics allowing users a better understanding of the cattle industry. In essence, the total inventories are distributed, on the basis of survey results and sector level balance sheets, to a specific farm type. The two major categories are dairy and beef. The beef sector is then broken down to beef cattle on cow/calf and mixed beef and dairy operations; beef cattle on feeder, stocker/finish operations; and, beef cattle on feeding operations, which include feedlots.

To summarize, the livestock statistics are survey-based estimates. The survey relies on a list frame that is established every five years by the Census of Agriculture and updated to include new entrants, particularly large hog operations. The probability sample surveys are conducted by telephone. The survey results are analysed and corrected before the data are used to analyse the industry and fine-tune the estimates. The survey data are reviewed in a board environment before the commodity analyst works with the data primarily using supply-disposition analysis. The results of the industry analysis are reviewed by the board before being sent to the individual provinces. Once the data are finalised they are released to the public and published. The principal data released include inventories and summarized supply-disposition tables. The data also flow, via farm income estimates, to the Canadian System of National Accounts. In addition the data are used in the calculation of net farm income projections, produced by Agriculture and Agri-Food Canada in co-operation with Statistics Canada and the provinces.
