## Note of appreciation

Canada owes the success of its statistical system to a long standing partnership between
Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

## Custom tabulations of SLID data

For clients with specialized data needs, custom tabulations can be produced on a cost-recovery basis. Contact Client Services, Income Statistics Division (1 (888) 297-7355 or (613) 951-7355; income@statcan.ca ).

## Remote access to SLID data

Remote access is an initiative that enables external researchers to access and use SLID data.

Under this arrangement, researchers contact the Income Statistics Division to indicate their interests in remote access to SLID data and provides a short abstract outlining the objectives for their research. Upon approval of their access request, researchers are provided with a copy of the SLID retrieval software (SLIDRET), as well as an empty SLID database structure.

Researchers write and test their own computer programs, then send these programs to Statistics Canada over the Internet. We submit their programs, vet the output for confidentiality, and e-mail the results back. This process opens up our complex data set to even more researchers and increases research volume.

This service is an alternative to Statistics Canada's Research Data Centres and regional offices.

Contact Client Services, Income Statistics Division (1 (888) 297-7355 or (613) 951-7355; income@statcan.ca).

## Research Data Centres

Research Data Centres are part of an initiative by Statistics Canada, the Social Sciences and Humanities Research Council (SSHRC) and university consortia to help strengthen Canada 's social research capacity and to support the policy research community.

## Table of contents

Highlights ..... 12
Related products ..... 15
Chapter 1 - Introduction ..... 19
Chapter 2 - Market income ..... 21
Improvement in the labour market in 2002 ..... 21
Little change in market income in 2002 after five consecutive years of growth ..... 21
After increasing between 1996 and 2001, a generalized pause in market income in 2002 for the main family types ..... 21
Market income of working age unattached women had increased since 1996 ..... 22
Difference in market income between all men and women narrowed in 2002 ..... 22
Market income trend varied among quintiles ..... 22
Chapter 3 - Government transfers ..... 36
Average government transfers were stable in 2002 as compared to 2001 ..... 36
Employment insurance benefits had second year of strong growth ..... 36
Transfers were higher for seniors than for people of working age ..... 37
The $20 \%$ lowest-income families received $30 \%$ of government transfers ..... 37
Share of transfers to lowest income families was stable ..... 38
Transfers to families with children in the absence of earnings ..... 38
Chapter 4 - Total income ..... 51
After five years of growth, a pause for average total income for non-elderly families ..... 51
Senior families' total income stable from 2001 to 2002 ..... 51
Income redistribution: impact of government transfers ..... 52
Chapter 5 - Income taxes ..... 67
Second recent decline in average tax paid by families ..... 67
Estimated declines of $2 \%$ or more in average income tax in most provinces in 2002 ..... 67
Implicit tax rates by family type ..... 68
Shares of total income tax by income quintile ..... 68
Chapter 6 - After-tax income ..... 81

## Table of contents - continued

After five consecutive years of growth, after-tax income experienced a pause in 2002 ..... 81
Differences from province to province between 1996 and 2002 ..... 81
Government transfers and taxes helped to reduce disparities between the different family types ..... 82
Lowering the disparity among income quintiles ..... 82
Disparities between quintiles varied by family types ..... 82
Chapter 7 - Family income: income inequality ..... 98
Has income inequality changed in recent years? ..... 98
Incomes improved over several years, across the distribution ..... 98
Slight narrowing of the gap in 2002 (in dollar terms), after it widened from 1996 to 2001 ..... 98
Income inequality in relative terms ..... 99
Increasing ratio of the top to the bottom ..... 100
The Gini coefficients declined for market income and remained stable for after-tax income in 2002 ..... 101
Chapter 8 - Low income ..... 118
After five years of consecutive reductions, in 2002, low income rate for families stopped dropping ..... 118
Low-income rate varied, depending on family type and number of earners ..... 118
Low-income rate for female lone-parent families increased after five consecutive years of decline ..... 119
Low-income rate for children continued its downward trend, while the rate for all Canadians grew slightly ..... 120
Crossing the LICO line ..... 121
Low income touched more than one in five people over a six-year period ..... 121

## Higblights

## 2002 income: an overview

- After five consecutive years of growth, after-tax family income remained virtually unchanged between 2001 and 2002, as the three main components - market income, government transfers and personal income taxes - each remained more or less stable.
- After-tax income for families of two people or more amounted to an estimated $\$ 60,500$, virtually unchanged from $\$ 60,300$ in 2001, after adjusting for inflation.
- This lack of growth was in contrast to the increase of $3.2 \%$ in annual average after-tax income for these families between 1996 and 2001.
- Family income is correlated with economic conditions. After reaching a peak at $\$ 53,900$ in 1989, average family income declined through the recession of the early 1990s and stayed below $\$ 52,000$ up to and including 1996. Since then, it has rebounded in step with the recovering economy.
- The low-income rate among families of two people or more edged up slightly in 2002 after five consecutive years of declines. A small increase in the low income rate was experienced by those aged 18 and over. However, the proportion of children aged under 18 and living in low income was marginally lower, continuing its long-term decline.
- Unlike most other family types, average after-tax income declined in 2002 for single-parent families headed by women. However, their income gains were among the strongest between 1996 and 2002 because of the increase in labour force participation by single mothers.
- For unattached individuals, after-tax income amounted to $\$ 25,900$ in 2002, up $2.4 \%$ from 2001 and $17 \%$ from 1996. An estimated 1 million of these individuals lived in low income in 2002, about $25 \%$ of the total, down from $34 \%$ in 1996.

## Main components all hold relatively steady

- The three main components of after-tax income - market income, transfers from governments and personal income taxes - were all relatively unchanged from 2001.
- Market income is the sum of paid employment and self-employment earnings, and income from investments and pensions, and represents the lion's share of family income, particularly for non-elderly families. In 2002, it remained at the same average level as in 2001 (approximately $\$ 66,000$ ) for families of two or more people. This compares with an annual average gain of $2.7 \%$ during the previous five years.
- Families of two or more people paid an estimated $\$ 12,800$ on average in personal income taxes in 2002, about $\$ 300$ less than in 2001 after adjusting for inflation.
- This decline, equal to about $2.3 \%$, came on the heels of a $7.1 \%$ decrease in 2001 when federal and provincial tax changes included increases in exemption and income threshold levels, and cuts in tax rates. The implicit tax rate for families was $17.4 \%$ in 2002, down from $17.8 \%$ in 2001.
- Government transfers cover a range of programs such as Employment Insurance, old-age security, child tax benefits and so on. They remained virtually unchanged from 2001 at an estimated $\$ 7,300$. In 1996, transfers amounted to $\$ 7,900$ on average.
- The number of families receiving Employment Insurance benefits rose $8.4 \%$ in 2002, following an 11.2\% gain in 2001. Average El benefits rose from $\$ 5,500$ in 2001 to $\$ 5,900$ in 2002. These increases are attributed mainly to the program changes that expanded parental benefits.

## After-tax income down for female single-parents

- On average, the after-tax income for the estimated 500,000 single-parent families headed by women declined from $\$ 32,500$ in 2001 to $\$ 30,800$ in 2002 mainly due to a drop in their market income from $\$ 27,300$ to $\$ 25,600$.
- Even when including the decline in 2002, the annual average rate of increase of market income for female lone-parent families was $5.5 \%$ between 1996 and 2002. This was one of the largest increases among the different family types. As a result the 2002 after-tax income of female single parents was still much higher than in 1996 ( $\$ 25,300$ ).

## Continuous growth of after-tax income for senior families

- Among senior families - those in which the major income recipient was aged 65 and over - after-tax income was estimated $\$ 43,400$, up from $\$ 39,000$ in 1996.
- After-tax income of senior families steadily grew for the past five years, primarily due to the increase of their market income. Between 1996 and 2002, after-tax income for senior families has increased $11 \%$, compared with $18 \%$ for all younger families.
- In 2002, senior families received on average an estimated $\$ 20,200$ in government transfers, accounting for $41 \%$ of their total income before taxes.

## Low-income rate among children down for sixth straight year

- Although the change is not significant the low-income rate among children under 18 based on after-tax income, declined for the sixth consecutive year in 2002.
- An estimated 702,000 young people, or $10.2 \%$ of the total, were living in low-income families. This level was down from 713,000 children in 2001 (10.4\%).
- The proportion of children living in low-income families has been declining since 1996, when it peaked at $16.7 \%$. This decline follows overall improvements in the Canadian economy during the late 1990s.

## Slight rise in low-income rate of families

- After five consecutive years of declines, the proportion of families living in low income rose slightly to $7.0 \%$ in 2002 from $6.6 \%$ the year before. The $6.6 \%$ level in 2001 was the lowest rate for families since 1980.
- An estimated 605,000 families were in low income in 2002, compared with 564,000 in 2001 and 870,000 in 1996.
- The long-term downward trend in the low-income rate reflected a healthy labour market in the latter part of the 1990s, as well as recent increases in transfers and cuts in income taxes.
- Of the estimated 500,000 lone-parent families headed by women, $34.8 \%$ were in low income in 2002 , up from $30.1 \%$ in 2001. This was the first increase in the low-income rate for these families in five years. Their low-income rate peaked at 49.0\% in 1996.
- For the population as a whole in the 10 provinces, about 2.9 million people, or $9.5 \%$, were living in low income in 2002.

## Income inequality among families remained stable

- One measure of income inequality is the ratio of average market income received by the $20 \%$ of families with the highest income compared with the $20 \%$ of families with the lowest income.
- In 2002, this ratio was about 11.7 to one. That is, the $20 \%$ of families with the highest income received about $\$ 11.70$ in market income for every $\$ 1$ received by the $20 \%$ with the lowest.
- However, taxes and transfers moderate the differences between the quintiles of the income distribution.
- In 2002, after taxes and transfers, the one-fifth of families with the highest income received $\$ 5.20$ in market income for every $\$ 1$ received by the one-fifth with the lowest. Historically, this ratio remained stable at about 4.8 to 1 for several years up to 1995. It then rose in 1996 and 1997 to 5.3 and, since then has remained at 5.2 to 5.3 .

## Provinces: After-tax income remained stable in most cases

- Families of two people or more recorded at least marginal increases in after-tax income in most provinces in 2002, but there was the occasional exception.
- In Alberta, after-tax income declined from $\$ 65,600$ in 2001 to $\$ 64,300$ in 2002. On the other hand, the proportion of these families living in low income in Alberta fell from $5.9 \%$ to $4.8 \%$.
- The biggest gain was in Nova Scotia where after-tax income for families of two or more people rose from $\$ 49,800$ to $\$ 51,500$.
- Families of two or more people in Newfoundland and Labrador received government transfers estimated at $\$ 11,300$ on average in 2002, highest in Canada and well above the national average of $\$ 7,300$.

## Introduction

Thhis report examines family income and low income in Canada. The data prior to 1996 are drawn from the Survey of Consumer Finances (SCF). Beginning with 1996, the data are taken from the Survey of Labour and Income Dynamics (SLID).

The publication is organized into chapters, each dealing with a specific income concept. Each chapter has a short analytical article, followed by data tables. Chapter 2 examines market income, also known as "income before transfers". It represents the money people earned from the labour market, investments and private pensions. Chapter 3 looks at government transfer payments, focusing on specific groups or family types (such as the elderly, lone-parent families and families without an earner) that are the target beneficiaries of most income security programs. Chapter 4 deals with the total income of Canadian families, examining the role of government transfers in total income. Chapter 5 presents information on income tax and how it varied by family type. Chapter 6 examines after-tax income. The joint effect of transfers and income taxes is assessed. Chapter 7 focuses on income inequality. Chapter 8 concentrates on low income in Canada, including low income persistence. Chapter 9 presents tables on family and person estimates used in the calculation of certain income figures in this publication. Background information on the data sources, notes and definitions, survey methodology and data quality is presented at the end of the publication.

The tables in this publication show data for at most a ten-year time-span, due to space constraints. The companion product to this publication -- a compilation of tables on CD-ROM called Income Trends in Canada (product number 13F0022XCB) -- replicates all of the tables in this publication but for the period starting with 1980. It also contains data for the provinces in addition to 15 metropolitan areas. Tables on earnings (the major component of market income) and other related income concepts or statistics are also included.

When assessing data trends over time, there is always the choice of time period on which to make comparisons. Obviously, the analytical section at the beginning of chapters focuses on what's "new", the most recent year of data available. But it also draws on trends over the previous several years. Over the past twenty years, the most notable events in the business cycle (a popular phrase for economic upturns and downturns) were the recessions in the early 1980s (about 1982 to 1983) and the early 1990s (about 1991 to 1993). Between these two reference points, 1989 stood out as a "peak" year for real incomes of families, which was not surpassed until 1998. Our 1998 edition highlighted those comparisons. For 1999, we highlighted the lengthy upwards trend of average real incomes since the lowpoint for family incomes during this decade, in most cases 1992 or 1993. The 2000 edition described the continued upward trend of market income and after-tax income mainly as a result of a vibrant labour market. The 2001 edition described the continued rise of after-tax income for families and individuals mainly as a result of increases in government transfers and decreases in income taxes. The present edition shows stability of income for families and individuals between 2001 and 2002, after 5 year upward trend (1996-2001).

Finally, "structural" changes regarding income, such as in the distribution of incomes across the population, tend to require a longer time period to reveal notable changes. When commenting on the income distribution in Canada, such as quintile analysis or the Gini coefficient, we often compare the last few years. For analysis at the provincial level, it is again preferable to look at a longer trend for the purpose of separating real changes in income levels from estimate variation that could be caused by smaller sample sizes at the provincial level.

Quintile analysis is frequently used in this publication. Quintile data are produced by ranking economic families of two persons or more from lowest to highest by the value of their income, grouping the ranked families into five equal-numbered groups, or "quintiles", and then calculating statistics on each of the groups. The income concept used in this publication to rank families is always after-tax income, so they are called after-tax income quintiles. This way of defining the quintiles has the advantage of holding the population in each quintile constant while comparing different characteristics, such as market income versus after-tax income. But one can also analyse market income using market income quintiles, or total income using total income quintiles, as shown in the CD-ROM product, Income Trends in Canada (product number 13F0022XCB) Table 701.

With the exception of table 7.4-1, income is not adjusted for family size. Since changes in family size can account for changes in average incomes, it is worth noting that the average number of members in economic families of two or more persons decreased slightly over the period of analysis, from about 3.14 in the early 1990s to 3.08 in 2002.

All the figures included in this report (unless otherwise stated) are sample survey estimates. To factor in inflation when comparing income levels across time, all the income estimates are expressed in constant dollars of the last year for which data are presented.

## Chatter 2

## Market income

Market income includes the earnings that Canadians receive from employment. Also included in market income is investment and private pension income. For the majority of Canadians, particularly those of "working age" (aged 16 to 64), money from employment constitutes the highest proportion of market income. In 2002, 89\% of aggregate market income came from employment.

## Improvement in the labour market in 2002

Market income is closely linked to labour market conditions. According to data from the Labour Force Survey, there was a rise of $1.0 \%$ in the employment rate (i.e. the number of people employed compared to the working age population) from 2001 to $62 \%$ in 2002. This increase was due mainly to a $1.3 \%$ growth in the participation rate, which climbed in 2002 to $67 \%$. In contrast, the unemployment rate rose between 2001 and 2002. It was at $7.7 \%$ in 2002 compared to a rate of $7.2 \%$ in 2001. The increase in the unemployment rate in 2002 was largely caused by more working age people looking for work. In 2002, real GDP per capita increased by $3.4 \%$.

## Little change in market income in 2002 after five consecutive years of growth

Average market income for Canadian families of two or more people was estimated at $\$ 65,900$ in 2002, virtually unchanged from $2001(-0.2 \%)$ after adjusting for inflation (as measured by changes in the Consumer Price Index). This represents a pause after five consecutive years of growth. Average market income has increased by over 17\% (on average $2.7 \%$ per year) since the low in 1996, when it was estimated at $\$ 56,200$.

Average market income for persons not living in families (unattached individuals) was $\$ 25,600$ in 2002 compared to $\$ 25,200$ in 2001 ( $+1.6 \%$ ). Unattached persons' average market income has not declined since 1996 and grew by 20\% between 1996 and 2002.

For all provinces, average market income for families of two or more people changed only slightly in 2002. Nevertheless, between 1996 and 2002, average market income increased in all provinces from a minimum of $6.9 \%$ in Prince Edward Island to a maximum of $22.8 \%$ in Nova Scotia.

## After increasing between 1996 and 2001, a generalized pause in market income in 2002 for the main family types

Market income for two parent families was estimated at $\$ 78,100$ in 2002, virtually unchanged from 2001 ( $\$ 78,000$ ). In contrast, average market income for all two parent families increased between 1996 and 2002 by 19\%. This growth corresponds to an average increase in average market income of $\$ 2.9 \%$ per year.

Average market income for female lone parent families rose from $\$ 18,500$ to $\$ 27,300$ between 1996 and 2001. In 2002, this figure was $\$ 25,600$. In all cases, the average annual increase between 1996 and 2002 was $5.6 \%$.

Elderly families (in which the major income recipient is 65 or older) saw their average market income increase by $16 \%$ between 1996 and 2002. During this period, there was steady growth in the average market income, which rose from $\$ 25,500$ to $\$ 29,600$.

Finally, the average market income of married couples without children who are not elderly persons rose from $\$ 61,500$ in 1996 to $\$ 69,500$ in 2002, an increase of $13 \%$. In contrast, this income was virtually unchanged from 2001 to 2002 (-1.6\%).

## Market income of working age unattached women had increased since 1996

Average market income for unattached working age women jumped 27\% between 1996 and 2002, while that of their male counterparts rose by $19 \%$. The gap in average market income between unattached working-age men and women fell from \$5,100 in 1996 to \$4,400 in 2002.

## Difference in market income between all men and women narrowed in 2002

The difference in average market income (for recipients of market income of all ages) between all men and women rose steadily until 2001 when it reached $\$ 15,200$. In 2002, the difference narrowed slightly, as market income for men was $\$ 38,200$ compared to $\$ 23,500$ for women.

## Market income trend varied among quintiles

Between 1996 to 2002, average market income for families in the lowest quintile increased by $\$ 3,200(+35 \%)$, while the increase for families in the highest quintile was $\$ 21,100(+17 \%)$.

## Chater 3

## Government tnamsfens

Government transfers cover a range of programs. For example, Employment Insurance provides temporary income assistance to those who lose their job or are absent for reasons of illness or the birth of a child. The Canada Pension Plan and the Quebec Pension Plan are the two public pension plans in Canada. Old Age Security, including the Guaranteed Income Supplement, provides financial support to seniors. Child tax benefits and other child credits or allowances are aimed at families with children. Other government transfers include social assistance from provincial and municipal programs, Workers' compensation benefits, the GST/HST Credit and provincial refundable tax credits such as the Quebec and Newfoundland and Labrador sales tax credits.

The implicit transfer rate shows the amount received from all these sources as a proportion of total income (before tax). Unless otherwise specified, the average amounts of transfers are calculated for the total population (both recipients and non-recipients); they would be higher if non-recipients were excluded.

In addition to what is provided in this chapter, Chapter 4 (Table 4.2) and Chapter 7 (Tables 7.1and 7.2-1) include data on government transfers.

## Average government transfers were stable in 2002 as compared to 2001

Average government transfers remained relatively constant in 2002. Those paid to all families of two or more people stood at $\$ 7,300$ while those paid to unattached individuals were $\$ 5,300$. However, average government transfers to families were $7.6 \%$ below the 1996 level of $\$ 7,900$.

The average transfers remained stable for most family types, for example average transfers to all two-parent families with children and to female lone-parent families respectively were both virtually unchanged in 2002 at $\$ 4,900$ and $\$ 8,200$ respectively. In contrast, average transfers to two-parent families with two earners grew by $9.8 \%$ in 2002 from $\$ 4,100$ to $\$ 4,500$. The growth for this group was almost entirely driven by a growth in the amount of Employment Insurance benefits received.

## Employment insurance benefits had second year of strong growth

Thhe number of families receiving Employment Insurance (EI) benefits rose by $8.4 \%$ in 2002 after rising $11.2 \%$ in 2001 . The average El benefits paid to such families was substantially higher as well: $\$ 5,900$ in 2002 as compared to $\$ 5,500$ in 2001 and $\$ 5,000$ in 2000. This increase brought the average benefits paid back to the 1996 level. As in 2001, part of the increase is attributable to policy changes that became effective December 31st 2000 for persons seeking parental leave: aggregate El payments for parental leave more than doubled in 2002. This increase was equal to $56 \%$ of the change in total benefits that year. ${ }^{1}$ A second substantial part of the change is most likely due to the higher amount of regular benefits paid out. While the number of unattached individuals receiving El benefits was relatively stable at 393,000 recipients, the average amount received increased by $27 \%$, from $\$ 4,100$ in 2001 to $\$ 5,200$ in 2002. This might be explained by more frequent unemployment spells or spells of longer duration because of the higher average unemployment rate: $7.7 \%$ in 2002 as compared to $7.2 \%$ in 2001.

[^0]
## Transfers were higher for seniors than for people of working age

Elderly families received an estimated $\$ 20,200$, on average, in government transfers in 2002, compared to an average $\$ 5,300$ for non-elderly families. These amounts can also be expressed as a proportion of total income, called the implicit transfer rate. In 2002, elderly families and elderly unattached individuals received $41 \%$ and $51 \%$, respectively, of their total income before tax in the form of transfers, while non-elderly families and non-elderly unattached individuals had corresponding implicit transfer rates of $6.9 \%$ and $7.3 \%$.

The trend over the past two decades in government transfers to elderly families has been less variable than transfers to non-elderly families. Since most seniors are retired, government transfers to this group are less tied to labour market conditions than transfers to families with children or other people of working age. Two of the main transfers to seniors are the Canada and Quebec pension plan benefits and the Old Age Security Pension, both of which are relatively independent of a person's or family's income level. The Guaranteed Income supplement - the needs-based portion of Old Age Security — provides an additional low-income supplement if necessary.
Chart 3.1
Implicit transfer rates for seniors are higher than for non-seniors, 1993 to 2002

## The 20\% lowest-income families received 30\% of government transfers

S
Some, but not all, government transfers are needs-based, meaning they are designed to supplement the incomes of lower-income families and individuals. This is evident in the distribution of transfers over the population when ranked from lowest to highest after-tax income. The share of transfers paid to families in the lowest after-tax income quintile is typically the highest - it was $30 \%$ in 2002. The share to the second lowest quintile was the second highest, at $25 \%$, and so on. The families in the highest income quintile received $11.5 \%$ of all transfers paid to families.

Chart 3.2
Market income and government transfers for families by after-tax income quintiles, 2002

## Share of transfers to lowest income families was stable

In the late 1990s, the share of all government transfers going to families in the lowest income quintile had generally been rising. It rose from $28 \%$ in 1996 to a peak of $31 \%$ in 2000 , and was closer to $30 \%$ in 2002. At least some of the change is likely related to changes made to government programs, rather than changes in labour market conditions. Among all recipients of child tax benefits, the average amount each family received from federal and provincial sources rose from an estimated $\$ 1,800$ on average in 1996 to $\$ 2,300$ in 2002 - an increase of about 28\%. The share of all government transfers going to the highest income quintile inched back up in 2002 to $11.5 \%$, but was still below the 1996 level of $12.1 \%$.

## Transfers to families with children in the absence of earnings

TTwo-parent families with no earnings for the whole year received on average $\$ 16,800$ in government transfers in 2002, or $67 \%$ of their total income in the form of transfers. Among female lone-parent families without earnings, $86 \%$ of their total income came from government transfers; the remainder came mostly from other income, which includes support payments from ex-spouses.

Table 3.1-11
Government transfers by after-tax income quintiles, British Columbia, 2001 and 2002

## Chatter 4

## Total income

T otal income is the sum of market income and government transfers.

Considering all sources of income, economic families of two persons or more received an estimated $\$ 73,200$ in average total income in 2002, virtually unchanged from the previous year ( $-0.3 \%$ ) after adjusting for inflation. Over the six year period, 1996 to 2002, total family income grew by 14\%; an average annual increase of $2.2 \%$. Average total income for unattached individuals was estimated at $\$ 30,900$ in 2002, slightly increased ( $+1.6 \%$ ) from the previous year. Between 1996 and 2002, their total income has increased by $15 \%$, equivalent to a $2.4 \%$ annual increase.

In 2002, average total income of families in all provinces experienced no significant changes over the previous year. When comparing 1996 to 2002, the largest increases in total family income were found in Nova Scotia ( $+17.7 \%$ ) followed by Alberta ( $+16.6 \%$ ). For both provinces, market income accounted for a large percentage of the total income ( $87 \%$ and $92 \%$ respectively).

For the first time since 1996, in 2002, average total income in Ontario did not increase from the previous year $(-0.9 \%)$. However, Ontario remained the province where families had the highest average total income $(\$ 81,400)$. Alberta was second in 2002 as family average total income was $\$ 77,100$. The province where the families had the lowest average total income was Newfoundland and Labrador with $\$ 55,400$. Over the six year period, 1996 to 2002, total family income in Newfoundland and Labrador grew by $13 \%$.

## After five years of growth, a pause for average total income for non-elderly families

In 2002, non-elderly families received on average an estimated $\$ 77,000$ in total income, virtually unchanged from $2001(-0.4 \%)$. From 1996 to 2002, their average total income went up by $14.9 \%$. Unattached individuals of working-age ( 16 to 64 years of age) received in 2002 an estimated average total income of $\$ 33,000$ representing an increase of $18 \%$ since 1996. In 2001, their total income was $\$ 32,300$.

## Senior families' total income stable from 2001 to 2002

TThe average total income of families, whose main income earner was a senior, gradually increased each year between 1996 and 2002. Comparing 1996 to 2002, the average total income grew 9.2\%. This trend is primarily due to an annual average increase in market income of $2.5 \%$. The estimated total incomes for 2002 and 2001 were $\$ 49,800$ and $\$ 49,100$ respectively.

Among elderly unattached individuals, women's average total income climbed by $7.5 \%$ since 1996, partially due to a $12.9 \%$ growth rate in market income. In 2002, average total income was estimated at $\$ 24,300$. The picture is slightly different for senior unattached men who experienced almost no change in total income between 1996 and 2002 (+0.7\%). Their total income was estimated at \$28,200 in 2002.

In aggregate terms, in 2002, market income accounted for $60 \%$ the total income of seniors living in families, almost unchanged from 2001 ( $59 \%$ ). The rest of their income came mostly from transfers such as public retirement pensions (18\%) and Old Age Security (19\%).

## Income redistribution: impact of government transfers

In 2002, families in the lowest income quintile received only $3.8 \%$ of aggregate market income, but their share of total income was larger: $6.4 \%$. Conversely, families in the highest income quintile received $44 \%$ of aggregate market income but $41 \%$ of total income.

Before government transfers, those in the highest income quintile received, on average, $\$ 11.70$ for each $\$ 1$ earned by those in the lowest quintile. After transfers, this ratio was reduced to $\$ 6.40$ to $\$ 1$.

Government transfers also reduced the income differences between various family types. Before transfers in 2002, the average income of non-elderly families was 2.4 times that of elderly families. After transfers, this ratio was reduced to 1.5 .

1. Source: Income Statistics Division, Statistics Canada.
2. Includes economic families of two persons or more and unattached individuals.
3. Starting in 1999, all social assistance amounts reported to the survey by one or both individuals in a couple are reassigned to the female spouse, or the older of the two spouses in the case of a same-sex couple. This caused a shift in some of the time series for social assistance data for individuals, for example, an increase in the average amount received, and a decrease in the number of recipients. The time series showing the aggregate amount of social assistance is not affected, nor are the data at the family or household level.
4. Includes economic families and unattached individuals. An economic family is defined as a group of two or more persons who live in the same dwelling and are related to each other by blood, marriage, common law or adoption. An unattached individual is a person living either alone or with others to whom he or she is unrelated, such as roommates or a lodger.

## Chater 5

## Income taxes

Income taxes include both federal and provincial taxes. The implicit tax rate shows taxes as a proportion of total income.

In addition to what is provided in this chapter, Chapter 7 (Tables 7.1 and 7.2-1) includes data on income taxes.

## Second recent decline in average tax paid by families

CCanadian families of two persons or more paid an estimated $\$ 12,800$ on average in income taxes in 2002, or about $\$ 300$ less (or $-2.3 \%$ ) than in 2001 (after adjusting for inflation). This followed a decline of about $7 \%$ in 2001, a year when the federal government and several provincial governments made changes in their income tax policies in the direction of lower taxation. In 2002, the average amount of federal income tax paid by families was about the same as in 2001. However, the average amount of provincial tax paid by families dropped $6 \%$.

## Estimated declines of 2\% or more in average income tax in most provinces in 2002

There were estimated declines of 2\% or more in average income tax paid by families in six of the ten provinces in 2002. The largest change in average tax paid by families in 2002 occurred in Nova Scotia, where it increased by about $12 \%$, or $\$ 1,200$ from $\$ 9,900$ in 2001.

Average taxes paid by unattached individuals were stable at the national level between 2001 and 2002. Unattached individuals paid on average $\$ 5,000$ in income taxes in those years, representing a $4.2 \%$ increase from 1996. Provincially, there were no significant changes in average taxes paid by unattached individuals between 2001 and 2002.

The relatively large increase in estimated average taxes in Nova Scotia in 2002 may be partially due to the fact that their tax-transfer system changed little while the average market income of non-elderly families - most of which would be taxable - increased by about $6.0 \%$. Nova Scotia did not increase its basic personal, spousal and eligible dependent exemption amounts or its statutory tax rates from 2001 levels.

The relatively large decrease in average tax paid by families in Manitoba, where it dropped by $5.7 \%$ in 2002, can be attributed to changes in taxation, which included increases in exemption amounts, a decrease in the statutory tax rate for the second income tax bracket (from $16.2 \%$ to $15.4 \%$ ) and a rise in the income threshold for the third income tax bracket (from $\$ 61,089$ to $\$ 65,000$ ). Although market income increased in Manitoba, changes in the tax-transfer system appear to have more than offset the effects of increased market income in that province.

Chart 5.1
Average income tax of families and unattached individuals, 1980 to 2002

## Implicit tax rates by family type

The implicit tax rate for Canadian families was $17.4 \%$ in 2002, down from $17.8 \%$ in 2001 and a lengthy plateau of 19 to 20 percent for several years before that. Unattached individuals had a similar decrease, posting an implicit tax rate of $16.3 \%$ in 2002 , down from $16.6 \%$ in 2001 , and a plateau fluctuating about $18 \%$ since 1996.

Families of two or more persons in which the major income earner was under age 65 and unattached individuals aged less than 65 had average implicit tax rates of $17.9 \%$ in 2002. In contrast, elderly families and elderly unattached individuals had lower average implicit tax rates of $12.9 \%$ and $10.8 \%$, respectively. The difference between seniors and the rest of the population is consistent given that retirement income is on average lower than income received over the course of one's working-age years-the ratio of tax to total income during retirement is also considerably lower on average.

Several family types have similar implicit tax rates. In 2002, among families in which the major income earner was under age 65, dual-earner couples without children, two-parent families with two earners, and two-parent families with one earner all paid, on average, about one-fifth of their total income in income taxes ( $20 \%, 19 \%$ and $19 \%$, respectively).

## Shares of total income tax by income quintile

In 2002, families in the highest after-tax income quintile paid on average $\$ 33,500$ in income taxes, or just over half ( $53 \%$ ) of the aggregate amount of income tax paid by Canadian families. As an indication of the progressivity of taxes, these high-income families had a smaller share of aggregate market income, 44\%. Looking at the other end of the distribution, one can expect to see the reversed situation in the presence of a progressive tax system. Indeed, families in the bottom quintile paid an average of $\$ 1,200$ in income tax. This was equal to $1.9 \%$ of the total income tax collected from families, while the share they held of the aggregate market income of families was $3.8 \%$.

## Chater 6

## Aftertax income

After-tax income is defined as total income (market income plus government transfers) less income taxes. Thus, after-tax income reflects income redistribution through transfers and taxes.

## After five consecutive years of growth, after-tax income experienced a pause in 2002

After adjustment for inflation, average after tax income for families of two or more people reached $\$ 60,500$ in 2002, remaining virtually unchanged from 2001 (+ $0.3 \%$ ). This change was significantly less than what these families experienced between 1996 and 2001, when the average annual increase was $3.2 \%$. As with after tax income, market income ( $-0.2 \%$ ) and total income ( $-0.3 \%$ ) remained relatively stable from 2001 to 2002. Nevertheless, after tax income had risen $18 \%$ since 1996.

The income of lone parent families headed by women climbed from $\$ 25,300$ to $\$ 30,800$ (+22\%) between 1996 and 2002. In 2001, it was $\$ 32,500$.

Families of two or more people whose main income earner was under 65 years of age received after tax income in 2002 of $\$ 63,200$, virtually the same as that of the previous year ( $+0.2 \%$ ). However, the average after tax income of these families had risen by almost $\$ 9,800$, or close to $18 \%$, since 1996.

In recent years, average after tax income of elderly families increased steadily, rising from a low of $\$ 39,000$ in 1996 to a high of $\$ 43,400$ in 2002 . However, since 1996, these families had experienced slower growth ( $+11 \%$ ) than families whose main income earner was under 65 years of age ( $+18 \%$ ), by a difference of 7 percentage points.

Average after tax income for unattached individuals was $\$ 25,900$ in 2002, relatively unchanged from $2001(+2.4 \%)$. These people had experienced steady growth in their income (+17\%) since 1996.

## Differences from province to province between 1996 and 2002

After tax income of families with two or more people had risen in all provinces since 1996. Between 1996 and 2002, the national growth rate for this type of family was $18 \%$, but rates varied considerably from province to province. Alberta and Ontario both exceeded the national average with growth rates of $20 \%$ and $18 \%$ respectively. The growth rates in the other provinces varied between 8.3\% (Prince Edward Island) and 17\% (Nova Scotia and Quebec). Between 2001 and 2002, after tax income for these families remained relatively stable for all provinces.

Similarly, after tax income for unattached individuals increased unevenly among the provinces. Since 1996, it had seen growth of $17 \%$ for Canada as a whole. As was the case for families of two or more people, the income of unattached individuals also rose in Ontario and Alberta, which respectively saw increases of $22 \%$ and $20 \%$ between 1996 and 2002. Compared to 2001, after tax income in 2002 remained the same in all provinces and did not see any significant changes.

## Government transfers and taxes helped to reduce disparities between the different family types

In 2002, families of two or more people earned an average of $\$ 7,300$ in transfers and paid $\$ 12,800$ in taxes for a net contribution of $\$ 5,500$. This amount was equal to $7.5 \%$ of their income before transfers and taxes. This means that the average family retained $92.5 \%$ of its market income.

Two earner couples with no children had the lowest proportion, retaining $83 \%$ of their market income. At the other end of the spectrum, this ratio was $147 \%$ and $120 \$$ respectively for families whose main income earner was an elderly person and for lone parent families headed by women. In other words, these families received more in transfers than they paid in taxes.

Personal income taxes and government transfers reduce the income disparities among the various types of families. While average market income for elderly families was $56 \%$ of average market income for non elderly families, the ratio was $88 \%$ for after tax income. Average market income of lone parent families headed by women was $48 \%$ of the average market income of all other families, but rose to $62 \%$ after transfers and taxes.

## Lowering the disparity among income quintiles

In
In 2002, families of two or more people whose market income was in the top quintile received $\$ 11.70$ for every dollar received by families in the bottom quintile. After transfers and taxes, the disparity was down to $\$ 5.20$ for every dollar.

The impact was even greater for unattached individuals. Those in the top quintile received $\$ 20.70$ for every dollar earned by unattached individuals in the bottom quintile. After transfers and taxes, unattached individuals in top quintile received $\$ 6.80$ for every dollar received by those in the bottom quintile.

Average after tax income for families of two or more people experienced virtually the same evolution in both the lowest and highest quintiles, which was not the case for average market income where there were greater differences. Thus, for the bottom quintile, average after tax income remained relatively stable compared to $2001(-0.4 \%)$ at around $\$ 22,300$ and much the same happened with the top quintile $(-0.8 \%)$ where after tax income was \$116,400 in 2002.

Since 1996, average after tax income in the first quintile saw a smaller increase ( $+17 \%$ or $\$ 3,200$ ) than market income ( $+35 \%$ or $\$ 3,200$ ). There was less of a disparity in the change in after tax income and market income in the last quintile, with after tax income increasing $20 \%$ (or $\$ 19,300$ ) and market revenue increasing $17 \%$ (or $\$ 21,100$ ).

For unattached individuals, the increase in after tax income in the first quintile was greater than for families of two or more people and rose $8.3 \%$ from 2001. In 2002, it was about $\$ 7,800$. For the highest quintile, the after tax income for unattached individuals was $\$ 53,200$ in 2002 , virtually unchanged from $2001(+0.8 \%)$. Unattached individuals in the lowest quintile had seen their after tax income increase by $22 \%$ (or $\$ 1,400$ ) since 1996 , while those in the highest quintile received an increase of $17 \%$ or $\$ 7,600$.

## Disparities between quintiles varied by family types

S
Since 1996, the disparity in the after tax income of persons in the first quintile and that of those in the last quintile increased but to differing degrees depending on family type.

In 1996, the disparity between the after tax income of the two quintile extremes for families of two or more people was $\$ 78,000$. In 2002, this gap had widened to $\$ 94,100$ or an increase of $20.6 \%$ in six years.

For unattached individuals, the disparity observed between the lowest quintile and the highest quintile climbed from $\$ 39,200$ in 1996 to $\$ 45,000$ in 2002, an increase of $15.8 \%$.

## Cbater 7

## Family income: income inequality

This chapter highlights broad trends in income inequality, both on a market income basis and an after-tax income basis. The difference between these two concepts of income is government transfers and income taxes, so the chapter also provides information on the redistributive impact of the tax-transfer system.

Quintile analysis is frequently used in this publication. For more information about quintiles, see Chapter 1 and the paragraph titled "Percentiles" in Data quality, concepts and methodology - Notes and definitions.

## Has income inequality changed in recent years?

This question can be answered in a few ways. One way is to look at income in absolute terms: did the differences in income across the population become larger or smaller in dollar terms? It can also be looked at in relative terms: how did the distribution of income change in terms of the share held by the families with the lowest and the highest income. Depending on how the income of all families changed, each approach could lead to a different conclusion. The following analysis illustrates changes in inequality among Canadian families using both points of view.

In absolute terms, i.e., in dollar terms, the disparities in after-tax income became wider over the years from 1996 to 2001. This happened mainly because of a greater improvement in the average income of the one-fifth of families with highest income (top quintile). In 2002, the distribution of after-tax income remained about the same as in 2001.

In relative terms, the distribution of after-tax income for the whole period from 1996 to 2002 changed very little.

## Incomes improved over several years, across the distribution

S
Since changes in aggregate income can have an impact on the conclusions to be made about inequality, it is important to recognize that average after-tax income for families had been on the rise since 1996. Most of the increase occurred over the five years from 1997 to 2001. Average after-tax income for families changed minimally between 2001 and 2002 (up $0.3 \%$ ).
When the population of families is broken down each year into five equal-sized groups or "quintiles", from lowest after-tax income to highest after-tax income, it can be seen that all five quintiles shared to some extent in the increases in after-tax income since 1996. The same is true for market income.

## Slight narrowing of the gap in 2002 (in dollar terms), after it widened from 1996 to 2001

Thincreased yearly, from $\$ 78,000$ in 1996 to $\$ 94,900$ in 2001. In 2002, this gap narrowed slightly to $\$ 94,100(-0.8 \%)$. Over the period from 1996 to 2002, the average after-tax income of the highest $20 \%$ of families of two or more persons rose by an estimated $\$ 19,300$ or $20 \%$. Although the lowest quintile had a $\$ 3,200$ increase in average income, this was a $17 \%$ improvement. The middle three quintiles
had increases of $15 \%$ to $16 \%$ in their average after-tax income. In short, the absolute gains of the highest quintile were the largest, in dollar terms and as a percentage of the income they started with. The lowest quintile had the smallest gains in dollar terms, but had the second highest gains as a percentage of the income they started with.
Looking at market income over the same period, the bottom two quintiles (still defined on an after-tax basis) had much larger percentage improvements in income than they did on an after-tax basis, but their market income is so low that even a small variation in dollar terms appears as a large percentage change. For example, the lowest quintile had an increase in average market income of $35 \%$ between 1996 and 2002, while the second quintile had an increase of $23 \%$. But in dollar terms, the lowest quintile gained $\$ 3,200$ in average market income and the second quintile gained $\$ 6,400$, contrasted with a gain by the highest quintile of $\$ 21,100$. For the highest quintile, this gain represented a $17 \%$ increase in their average market income.

Chart 7.1 shows the average after-tax income for families in each quintile, at three points in time covering the period 1996 to 2002. A line drawn between the points of each adjacent pair of quintiles shows the degree of inequality in the distribution between the five groups of the population, in absolute terms. An increase in the steepness of the line between two years suggests that the distribution has become less equal, while a flatter line suggests it has become more equal.
Between 1996 and 2000, the line in chart 7.1 shifted upwards and became steeper. This is true for all segments of the line, but especially between the fourth and fifth quintiles. This suggests that the inequality of the distribution of income grew across all five quintiles, but especially between the highest quintile and all other families. Between 2000 and 2002, the line shifted upwards slightly, but did not become much steeper. This suggests that the inequality of the distribution did not change much between 2000 and 2002.

Chart 7.1
Average after-tax income of families by quintiles, for years 1996, 2000 and 2002

## Income inequality in relative terms

Byon relative changes among quintiles. Any increase to a particular quintile is necessarily a decrease for
some other quintiles. How did the shares of income received by lower-, middle-, and higher-income families evolve in the last several years?

There was a very small and gradual shift in favour of the highest quintile families from 1996 to 1998, as their share of after-tax income rose from $38 \%$ to $39 \%$. Their share did not fluctuate between 1998 and 2002, at an average of $39 \%$. Any changes in the shares of market income were even less evident over the period from 1996 to 2002.

Chart 7.2
Shares of aggregate after-tax income by quintiles, 1980 to 2002

## Increasing ratio of the top to the bottom

Another relative measure of income inequality is the ratio of average income of the highest income families to that of the lowest income families. This measure focuses on the two ends of the income distribution. Again, after-tax income quintiles are used here to identify these two groups of families.

This ratio shows quite starkly the impact that taxes and transfers have in moderating differences between the outer ends of the distribution. In terms of market income, the ratio of average income received by the families in the highest quintile versus those in the lowest quintile was 11.7 to 1 in 2002, i.e., $\$ 11.70$ held by the highest quintile for every one dollar held by the lowest quintile. However, after taxes and transfers, the ratio was much lower, 5.2 to 1 .

As for the movement in the after-tax income ratio of top to bottom, it remained stable at about 4.8 to 1 for several years up to 1995. It then rose in 1996 and 1997 to 5.3 and fluctuated very little in the four years leading up to 2002, when it was estimated to be 5.2 to 1 .

While this measure would suggest that income inequality increased during 1996 and 1997, the interpretation of changes in this ratio has to be done carefully. A given dollar increase or decrease for the lowest quintile will always be larger in percentage terms than for the highest quintile. With the ratio measure in particular, when the income of the lower quintile is rising, the value of the ratio can decrease, even while the gap in dollar terms between the top and the bottom is widening.

This apparent contradiction occurred, in fact, when the ratio for market income fell between 1998 and 2000. Over that period, the gap in average market income between the lowest 20\%
of families and the highest $20 \%$ increased by over $\$ 4,600$, as a result of a $\$ 2,300$ increase for the lowest quintile and a $\$ 6,900$ increase for the highest quintile - clearly a larger dollar gain for the higher quintile. But because it represented a $23 \%$ increase for the lowest quintile and only a $5.0 \%$ increase for the higher quintile, the ratio of average market income of the top to the bottom declined; it fell from 13.8 to 1 in 1998, to 11.8 to 1 in 2000. The ratio of average market income of the top to the bottom then rose to 12.1 to 1 in 2001, but fell again in 2002 to 11.7 to 1 .

Chart 7.3
Ratio of average income of the highest quintile families to the lowest, showing market income and after-tax income, 1980 to 2002

Average income ratio:
Highest to lowest quintile

## The Gini coefficients declined for market income and remained stable for after-tax income in 2002

The Gini coefficient is a number between zero and one that measures the degree of inequality in the distribution of income. Again, this is a relative measure of inequality. The coefficient would register zero (perfect equality) for a population in which each member received exactly the same income and it would register a coefficient of one if one member received all the income and the rest received none. Even though a single Gini coefficient value has no simple interpretation, comparisons of the level over time or between populations are very straightforward: the higher the coefficient, the higher the inequality of the distribution, and vice versa.

The Gini coefficients were fairly stable from 1991 to 1995 , at about 0.43 for market income and 0.30 for after-tax income. They then rose for the next two years. After this point, Gini coefficients for market income declined slowly to 0.42 in 2002 and Gini coefficients for after-tax income remained stable at 0.31 .

## Chater 8

## Low income

A
person in low income is someone whose family income falls below Statistics Canada's low-income cutoffs (LICOs). The cutoffs reflect an income level at which a family is likely to spend significantly more of its income on food, shelter and clothing than the average family.

Low-income cutoffs have been calculated using both total income (that is, income after government transfers but before taxes) and after-tax income. The analysis below provides after-tax low-income information. Statistics Canada considers this measure to be preferable for two main reasons. First, income taxes and transfers are essentially two methods of income redistribution. The before-tax rates only partly reflect the redistributive impact of Canada's tax/transfer system, by including the effect of transfers but not the effect of income taxes. Second, since the purchase of necessities is made with after-tax dollars, it is logical to use people's after-tax income to draw conclusions about their overall economic well-being.

When is someone counted as being in low income? Low-income cutoffs depend on family size since larger families need more income to meet their needs. The cutoffs also take into account the varying costs by community size. In 2002, a family of four living in a city with a population of half a million or more would be counted as low income if the total of the after-tax income for all family members fell below the cutoff of $\$ 30,576$. For the same family living in a rural area, the cutoff was $\$ 20,047$.

## After five years of consecutive reductions, in 2002, low income rate for families stopped dropping

After five consecutive years of decrease in the low-income rate, reflecting a well-performing economy and a decrease in income taxes, in 2002 the low-income rate stopped dropping. Since the increase from 2001 to 2002 is not statistically significant, only the subsequent years of data will allow to determine if the trend has changed. This low-income rate in 2002 represents an estimated 605,000 families.

Although the low-income rate has changed, the financial situation of families below the low-income cutoff has remained unaffected over the past 6 years. In 2002, families in low income would have needed, on average, an additional $\$ 6,900$ in after-tax dollars to reach the low-income cutoff. In relative terms, this gap was $30 \%$ of the low-income cutoff. During the years 1996 to 2001, this gap for low income families was between $30 \%$ and $32 \%$.

Among unattached individuals, 1,015,000 or $25 \%$ were in low income in 2002, down from $34 \%$ in 1996 and $26 \%$ in 2001. Unattached individuals in low income would have needed, on average, an extra $\$ 5,200$ to reach the low-income cutoff in 2002. In relative terms, their low income gap was $36 \%$ of the low-income cutoff. During the years 1996 to 2001, this gap for low income unattached individuals varied between $37 \%$ and $39 \%$.

## Low-income rate varied, depending on family type and number of earners

Over the last seven years, the low-income rate for elderly families did not change much, decreasing slightly from $3.0 \%$ in 1996 to $2.7 \%$ in 2002, while that for non-elderly families dropped from $11.9 \%$ to $7.7 \%$. The difference between these rates diminished. However, there are larger differences among family types and when considering the number of earners in the family. Only $5.5 \%$ of non-elderly married
couples with no children at home were in low income in 2002. Their low-income rate approached 30\% if both partners were non-earners in 2002, and was much smaller ( $2.3 \%$ ) if both received earnings.

For the $3,124,000$ two-parent families with children, the average low-income rate was $5.4 \%$. A majority of these two-parent families $(1,943,000)$ had two earners in 2002; the low-income rate for this group was $3.0 \%$ ( $2.6 \%$ in the previous year). Of the estimated 454,000 two-parent families with one earner, $15 \%$ were in low income. Although relatively few in number, $72 \%$ of the 45,000 two-parent families with no earners experienced low income in 2002. Six years earlier, the rate was even higher at $81 \%$.

Chart 8.1
Majority of families with no earner were in low income, 2002

## Low-income rate for female lone-parent families increased after five consecutive years of decline

After five uninterrupted years of decrease from $49 \%$ in 1996 to $30 \%$ in 2001 the low income rate for female lone parent families grew in 2002: of the 500,000 lone-parent families headed by women, $35 \%$ were in low income. About $82 \%$ of lone-parent families headed by women had earnings in 2002 (the same rate as in 2001) while in 1996 the corresponding figure was $65 \%$. Although the low-income rate of female lone-parent families with one earner was about four times the average for all families ( $28 \%$ versus $7.0 \%$ ), they fared much better than lone mothers without earnings; $85 \%$ of the latter experienced low income in 2002.

On the other hand, the low-income rate for lone-parent families headed by men declined since 1996, when it was $22 \%$. By 2002, it halved to $11 \%$.

## Low-income rate for children continued its downward trend, while the rate for all Canadians grew slightly

After climbing throughout the early 1990s, the prevalence of low income peaked in 1996, at $14.0 \%$, and then declined to $9.3 \%$ in 2001. In 2002, $9.5 \%$ of all Canadians were living in low income (about 2.9 million persons). Low income was more prevalent among women than men ( $10.1 \%$ versus $8.8 \%$ in 2002).

About 702,000 children under 18 were living in low income families in 2002, down from $1,175,000$ in 1996. The proportion of children living in low-income families has been falling since 1996, when it last peaked at $16.7 \%$ on an after-tax income basis. In 2002, the percentage of children in low income fell to $10.2 \%$ - the lowest rate recorded from 1980 onward (the earliest year for which comparable data are available). In 2001 the rate was $10.4 \%$.

The number of children in low-income living in two-parent and female lone-parent families were comparable ( 341,000 and 329,000 respectively). However, at $6.0 \%$ in 2002, the low-income rate of children living in two-parent families was much lower than that of children living in female lone-parent families (39\%).

Among seniors aged 65 and over, low-income rates and trends varied by gender. In 2002, the low-income rate for women aged 65 and over was $9.0 \%$, the respective rate for men was $4.4 \%$. Historically, low-income rates for senior women have been more than double those for senior men. From 1980 until 1992 the low-income rate for senior men has been dropping steadily from about $14 \%$ and in the early 1990's the rate stabilised at around $4 \%$ to $5 \%$. For senior women, the low-income rate has been diminishing gradually since 1980, when the rate was about $26 \%$. Seniors living on their own, as unattached individuals, did not fare as well as those living in families: $18 \%$ were in low income in 2002, compared with only $2.2 \%$ of seniors living in an economic family. The rate was $20 \%$ for unattached older women and $14 \%$ for unattached older men.

People in the 18 to 64 age range accounted for about two-thirds of the low-income population. Their low-income rate was close to the average rate for the population at large: $9.7 \%$ of individuals in this age group was in low income in 2002.

Low-income rates of children, adults of working age, and seniors, 1980 to 2002

## Crossing the LICO line

A
family's income often changes substantially over time. A breadwinner may lose a job; a second family member may enter the labour market. The family itself may experience a change, such as marital separation, which often affects income. The birth of a child, an older relative joining the household or even a move to a larger city can affect income needs. Such changes can cause a family to "cross the line", moving into or out of low income.

Of all persons in low income in 2001, $33 \%$ were no longer below the line in 2002, while the remaining $67 \%$ stayed in low income both years. Of all people in low income in 2002, 33\% had not been in low income the year before. In short, there is clearly some turnover in the low income population from one year to the next, even when the overall low income rate is does not change much, as was the case between 2001 and 2002. At least for some, low income is not a persistent state. However, this level of turnover also means that, over a longer period, the number of people that experienced low income at some point in time is much greater than one might conclude based on annual low income rates.

## Low income touched more than one in five people over a six-year period

According to data referring to the period from 1996 to 2001, almost a quarter of all Canadians experienced low income at some time over a six-year period (24\%). This reflects the fact that, for some, low income is a transitory experience. About $8.5 \%$ experienced one year of low income and $5.0 \%$ experienced two years (not necessarily consecutive). At the other extreme, $3.1 \%$ of the population was in low income throughout the full six years. Among all those below the cutoff at some time during the six-year period, the average spent 2.7 years in low income.

Among children under age 18, $29 \%$ were in families that experienced low income at some time over the 1996-2001 period. About $9.6 \%$ were in low income for one year, $2.8 \%$ for all six years. The average number of years in low income for children was 2.7, about the same as the average for all persons.

At some time during the 1996 to 2001 period, $14 \%$ of seniors experienced low income. While this rate is below the $24 \%$ rate for the whole population, $4.2 \%$ seniors experienced six years of low income which is above the rate for all Canadians.

## Notes and definitions

## Income

Thhis section reviews the definitions of the main income concepts and their components. In order to highlight the relationships between them, this section is organized according to the "Classification of income" ( see text box - Classification of income by source).

## Classification of income by source

```
Mlarket income
    Earnings
        Wages,salaries and commission
        Self-employment income
            Farm
        Non-farm
            Investment income
            Retirement pensions
            Other income
(plus) Government transfers
    Child tax benefits
    Old Age Security and Guaranteed Income Supplement/Spouse's Allowance
    Canada Pension Plan/Quebec Pension Plan benefits
    Employment Insurance benefits
    Social assistance
    Workers' compensation
    GST/HST Credit
    Provincial/territorial tax credits
    Other government transfers
(equals) Total Income
(minus) Income tax
(equals) After-tax Income
```

## The concept of income

There are several important inclusions and exclusions in the concept of income:

- The concept of income covers income received while a resident of Canada or as relevant for income tax purposes in Canada. This excludes some, but not all, foreign income.
- Retirement income received as a regular pension or annuity during retirement is included, while cash withdrawals from private pension plans, including Registered Retirement Savings Plans (RRSPs), prior to retirement, are excluded.
- Realized capital gains from financial investments are excluded.
- In the Canadian System of National Accounts (CSNA) and the present income classification, taxes on capital gains are included in income taxes, as are taxes on RRSP withdrawals. Both capital gains (the taxable portion thereof) and RRSP withdrawals figure in the calculation of taxes, but are not part of total income in the CSNA or in SLID's classification of income.
- SLID's classification of income includes all refundable tax credits and benefits, including those that are not considered for income tax purposes, such as child tax benefits, the Goods and Services Tax Credit/Harmonized Sales Tax Credit, and other provincial or territorial tax credits. There are other smaller differences between SLID's total income and total income defined for tax purposes (see Other income and Other government transfers ).
- Contributions to Employment Insurance and the Canada and Quebec Pension Plans, both federal programs, are not included in income taxes, nor are they deducted from income to arrive at after-tax income. However, the CSNA recently revised its definition of taxes on production to include these payroll taxes, in accordance with international recommendations on national accounting.

## Market income

M
arket income is the sum of earnings (from employment and net self-employment), net investment income, (private) retirement income, and the items under "Other income". It is equivalent to total income minus government transfers. It is also called income before taxes and transfers.

## Earnings

T his includes earnings from both paid employment (wages and salaries) and self-employment.

## Wages, salaries and commission

TThese are gross earnings from all jobs held as an employee, before payroll deductions such as income taxes, employment insurance contributions or pension plan contributions, etc. Wages and salaries include the earnings of owners of incorporated businesses, although some amounts may instead be reported as investment income. Commission income received by salespersons as well as occasional earnings for baby-sitting, for delivering papers, for cleaning, etc. are included. Overtime pay is included.

Military personnel living in barracks are not part of the target population in SLID.

## Self-employment income

TThis is net self-employment income after deduction of expenses. Negative amounts (losses) are accepted. It includes income received from self-employment, in partnership in an unincorporated business, or in independent professional practice. Income from roomers and boarders (excluding that received from relatives) is included. Note that because of the various inclusions, receipt of self-employment income does not necessarily mean the person held a job.
Self-employment income is subdivided into farm self-employment income and non-farm self-employment income. Farm self-employment income is reported by individuals who operate their own or a rented farm, either on own account or in partnership. Included are money receipts from the sale of farm products as well as related supplementary and assistance payments from governments. Income in kind is excluded.

## Investment income

Th
This includes interest received on bonds, deposits and savings certificates from Canadian or foreign sources, dividends received from Canadian and foreign corporate stocks, cash dividends received from insurance policies, net rental income from real estate and farms, interest received on loans and mortgages, regular income from an estate or trust fund and other investment income. Realized capital gains from the sale of assets are excluded. Negative amounts are accepted.

## Retirement pensions

This is retirement pensions from all private sources, primarily employer pension plans. Amounts may be received in various forms such as annuities, superannuation or RRIFs (Registered Retirement Income Funds). Withdrawals from RRSPs (Registered Retirement Savings Plans) are not included in
retirement pensions. However, they are taken into account as necessary for the estimation of certain government transfers and taxes. For data obtained from administrative records, income withdrawn from RRSPs before the age of 65 is treated as RRSP withdrawals, and income withdrawn from RRSPs at ages 65 or older is treated as retirement pensions. Retirement pensions may also be called pension income.

## Other income

This sub-total includes all items of market income not included elsewhere. Among them are support payments received (also called alimony and child support). The coverage of other items depends at least to some extent on the method of income data collection, whether from administrative income tax records or by interview. Those items which are included on line 130 of the T1 tax return are well covered. These include, but are not restricted to, retirement allowances (severance pay/termination benefits), scholarships, lump-sum payments from pensions and deferred profit-sharing plans received when leaving a plan, the taxable amount of death benefits other than those from CPP or QPP, and supplementary unemployment benefits not included in wages and salaries.

## Government transfers

Government transfers include all direct payments from federal, provincial and municipal governments to individuals or families. See the table Classification of income for a list of the government transfers identified separately in the latest reference year. It should be noted that many features of the tax system also carry out social policy functions but are not government transfers per se. The tax system uses deductions and non-refundable tax credits, for example, to reduce the amount of tax payable, without providing a direct income.

## Child Tax Benefits

Federal child tax benefits began in 1993 and replaced both the federal Family Allowances and the Child Tax Credit. Several provincial and territorial programs have since been introduced, in addition to Quebec family allowances which already existed before 1993. To be eligible, a person must have the primary responsibility for the care and upbringing of one or more children under the age of 18. Most benefits are calculated by setting a maximum amount per family or per child and reducing that total by a certain percentage of the family's net income.

The programs which were explicitly accounted for in the data for 2001 were the federal basic benefit and National Child Benefit Supplement (together called the Canada Child Tax Benefit), the Newfoundland and Labrador Child Benefit, the Nova Scotia Child Benefit, the New Brunswick Child Tax Benefit, the New Brunswick Earned Income Supplement, the Quebec Allocation familiale, the Quebec Allocation à la naissance, the Ontario Child Care Supplement for Working Families, the Saskatchewan Child Benefit, the Alberta Family Employment Tax Credit, the BC Family Bonus, and the BC Earned Income Benefit.

## Old Age Security (OAS)

The Old age security (OAS) pension is targeted to Canadian residents aged 65 and over. OAS recipients who have little or no other income may also receive the federal Guaranteed Income Supplement (GIS); and their spouses, if aged 60 to 64 (and not yet eligible for OAS and GIS themselves), receive the Spouse's Allowance.

## Canada Pension Plan (CPP) and Quebec Pension Plan (QPP)

The CPP and QPP are compulsory contributory social insurance programs that provide a source of retirement income and protect workers and their families against loss of income due to disability or death.

## Employment Insurance

E
Employment insurance is a federal program which includes the following types of benefits: regular unemployment benefits, sickness benefits, maternity and parental benefits, and benefits for persons taking approved training courses or participating in job creation or job-sharing projects. To qualify, the claimant must have ceased receiving employment income and have worked a minimum number of weeks or hours of insurable employment over the preceding period.

## Social assistance

Social assistance covers many provincial and municipal income supplements to individuals and families. It is usually provided only after all other possible sources of support have been exhausted.

## Workers' compensation

W orkers' compensation is provided to protect all full-time and part-time employees from loss of salary due to work accidents or occupational diseases and help them to pay their medical expenses and other costs.

## Goods and Services Tax/Harmonized Sales Tax Credit

Introduced in conjunction with the Goods and Services Tax in 1990, it is intended to offset the GST/HST for lower income families and individuals. In Nova Scotia, New Brunswick, and Newfoundland and Labrador it is called the Harmonized Sales Tax Credit because the administration of the tax is combined with the provincial sales tax. Included is the federal Relief for Heating Expenses paid in 2001.

## Provincial/territorial tax credits

Included here are refundable tax credits other than those for children (included with child tax benefits). Some are designed to help low income individuals and families to pay property taxes, education taxes, rent and living expenses, and so on. Provincial sales tax credits such as the Quebec Sales Tax Credit and the Newfoundland and Labrador HST Credit are included. The Quebec abatement, although refundable, is not included here but rather with income taxes.

## Other government transfers

TThis includes government transfers not included elsewhere, mainly any other non-taxable transfers. In SLID, these amounts are included with "Other income". This is partly because the coverage of any transfers not taxed through the income tax system is low. There may be under-reporting of these transfers, which are mainly collected using an open question in SLID interviews. Nonetheless, the types of transfers which have come under this heading include: training program payments not reported elsewhere, the Veteran's pension, pensions to the blind and the disabled, regular payments from provincial automobile insurance plans (excluding lump-sum payments), and benefits for fishing industry employees.

## Total income

Total income refers to income from all sources including government transfers before deduction of federal and provincial income taxes. It may also be called income before tax (but after transfers). All sources of income are identified as belonging to either market income or government transfers.

## Income tax

Income tax is the sum of federal and provincial income taxes payable (accrued) for the taxation year. Income taxes include taxes on income, capital gains and RRSP withdrawals, after taking into account exemptions, deductions, non-refundable tax credits, and the refundable Quebec abatement. The data are either taken directly from administrative records or estimated based on aggregate data from administrative records, as this yields better results than the amounts reported by interview.

## After-tax income

After-tax income is total income, which includes government transfers, less income tax. It may also be called income after tax.

## Family

## Dwelling

In general terms a dwelling is defined as a set of living quarters. A private dwelling is a separate set of living quarters with a private access. A collective dwelling may be institutional, communal or commercial in nature. Of the different types of collective dwellings, SLID covers only communal dwellings.

## Household

A household is defined as a person or group of persons residing in a dwelling.

## Adults

Adults are defined in SLID as individuals 16 or older as of December 31st of the reference year.

## Family income

Family income is the sum of income of each adult in the family as defined above. Household income is likewise the sum of incomes of all adults in the household. Family and household membership is defined at a particular point in time, while income is based on the entire calendar year. The family members or "composition" may have changed during the reference year, but no adjustment is made to family income to reflect this change.

SLID defines households and families according to the living arrangements on December 31 of the reference year. Residents of Canada are also defined at those points in time.

## Economic family type

Economic family type refers to either economic families or unattached individuals. An economic family is defined as a group of two or more persons who live in the same dwelling and are related to each other by blood, marriage, common law or adoption. An unattached individual is a person living either alone or with others to whom he or she is unrelated, such as roommates or a lodger. See Family classification for more detailed groupings.

## Census family type

C
Census family type refers to either census families or persons not in census families. The term "census family" corresponds to what is commonly referred to as a "nuclear family" or "immediate family". In general, it consists of a married couple or common-law couple with or without children, or a lone-parent with a child or children. Furthermore, each child does not have his or her own spouse or child living in the household. A "child" of a parent in a census family must be under the age of 25 and there must be a parent-child relationship (guardian relationships such as aunt or uncle are not sufficient).

Persons "not in census families" are those living alone, living with unrelated individuals, or living with relatives but not in a husband-wife or parent-unmarried child (including guardianship-child) relationship.

By definition, all persons who are members of a census family are also members of the same economic family.

## Major income earner

T
his characteristic is important for the derivation of detailed family types (see Family classification).

For each household and family, the major income earner is the person with the highest income before tax, with one exception: a child living in the same census family as his/her parent(s) cannot be identified as the major income earner of the census family (this does not apply to economic families).

For persons with negative total income before tax, the absolute value of their income is used, to reflect the fact that negative incomes generally arise from losses "earned" in the market-place which are not meant to be sustained. In the rare situations where two persons have exactly the same income, the older person is the major income earner.

## Family classification

SıID
uses the major income earner to classify families.

## Classification of family types

```
Economic families (or Census families), 2 persons or more
Elderly families
Married couples
Other elderly families
Non-elderly families
Married couples without children

> No earner
One earner
Two earners
Two-parent families with children

> No earner
One earner
Two earners
Three or more earners
Married couples with other relatives
Lone-parent families
Male lone-parent families
Female lone-parent families
No earner
One earner
Two or more earners
Other non-elderly families
Unattached individuals (or Persons not in census families)
Elderly male
Non-earner
Earner
Elderly female
Non-earner
Earner
Non-elderly male
Non-earner
Earner
Non-elderly female
Non-earner Earner
```

## Elderly family

T
The major income earner is aged 65 or over.

## Non-elderly family

The major income earner is under age 65.

## Married couples/spouses

Married couples, including legally married, common-law and same-sex relationships, where one of the spouses is the major income earner.

## Children

A child or children (by birth, adopted, step, or foster) of the major income earner under age 18. Other relatives may also be in the family.

## Lone-parent family

Includes at least one child as defined above. Families where the parent is 65 years or older are excluded.

## Relative

A person related to the major income earner by blood, marriage, adoption or common-law.

## Other relative

A person in the economic family who is not the major income earner nor his/her spouse or child under age 18.

## Analytical concepts

## Current dollars versus constant dollars

Current dollars are what we usually mean when we refer to a currency in the current time period. The term "constant dollars" refers to dollars of several years expressed in terms of their value ("purchasing power") in a single year, called the base year. This type of adjustment is done to eliminate the impact of widespread price changes.

Current dollars are converted to constant dollars using an index of price movements. The most widely used index for household or family incomes, provided that no specific uses of the income are identified, is the Consumer Price Index (CPI), which reflects average spending patterns by consumers in Canada.

The text table 1 shows the annual rates of the Consumer Price Index. To convert current dollars of any year to constant dollars, divide them by the index of that year and multiply them by the index of the base year you choose (remember that the numerator contains the index value of the year you want to move to). For example, using this index, $\$ 10,000$ in 1997 would be $\$ 10,548$ in 2000 constant dollars (\$10,000 7 113.5/107.6 = \$10,548).
Text Table 1
Consumer price index, annual rates, 1992=100

| 1980 | 1981 | 1982 | 1983 | 1984 | 1985 | 1986 | 1987 | 1988 | 1989 | 1990 | 1991 | 1992 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 52.4 | 58.9 | 65.3 | 36.1 | 72.1 | 75.0 | 78.1 | 81.5 | 84.8 | 89.0 | 93.3 | 98.5 | 100.0 |
| 1993 | 1994 |  | 1995 | 1996 | 1997 | 1998 | 1999 |  | 2000 | 2001 | 2002 | 2003 |
| 101.8 | 102.0 |  | 104.2 | 105.9 | 107.6 | 108.6 | 110.5 |  | 113.5 | 116.4 | 119.0 | 122.3 |

## Earner/Income recipient

 $A_{n}$ earner is a person who received income from employment (wages and salaries) and/or self-employment during the reference year. The term income recipient is generally used for someone who received a positive (or negative) amount of income of any given type.
## Mean income (average income)

The mean or average income is computed as the total or "aggregate" income divided by the number of units in the population. It offers a convenient way of tracking aggregate income while adjusting for changes in the size of the population.
There are two drawbacks to using average income for analysis. First, since everyone's income is counted, the mean is sensitive to extreme values: unusually high income values will have a large impact on the estimate of the mean income, while unusually low ones, i.e. highly negative values, will drive it down. (See also Recipients versus non-recipients and Negative values.) Secondly, it does not give any insight into the allocation of income across members of the population. To examine allocation of income, measures such as Percentiles or Gini coefficients may be used.

## Recipients versus non-recipients (zero values)

F
or every table showing average incomes, it must be kept in mind whether non-recipients of that type of income are included or excluded from the population. In the case of total family income, the difference from including or excluding units with zero income is small since there are very few such families. However, if one is interested in the average amount of individual self-employment earnings, the value will be quite different if one includes those persons who were not self-employed.

## Negative values

Negative income amounts can arise in two ways: net losses from self-employment (expenses exceed receipts), or net investment losses (losses exceed gains). As with zero values, negative values can have a large impact on results. In general, the published income tables treat negative values no differently than positive values, but there are a few exceptions: for the calculation of both Gini coefficients and the low income gap, negative values are converted to zeroes; and in the derivation of the major income earner of a family or household, the absolute value is used instead (see Major income earner).

## Percentiles

Income percentiles, like quintiles and deciles, are a convenient way of categorizing units of a given population from lowest income to highest income for the purposes of drawing conclusions about the relative situation of people at either end or in the middle of the scale. Rather than using fixed income ranges, as in a typical distribution of income, it is the fraction of each population group that is fixed.

First, all the units of the population, whether individuals or families, are ranked from lowest to highest by the value of their income of a specified type, such as after-tax income. Then the ranked population is divided into five groups of equal numbers of units, called quintiles. Analogously, dividing the population ranked by income into ten groups, each comprising the same number of units, produces deciles.

Most analyses should be carried out on the people of different percentiles within one population distribution. Care should be taken in making comparisons between percentiles that resulted from different distributions, because any difference in either the population or the income concept used to rank units could have a large effect. It is probable that both the income ranges represented by each percentile and the people making up each percentile will be different.

## Median income

The median income is the value for which half of the units in the population have lower incomes and half has higher incomes. To derive the median value of income, units are ranked from lowest to highest
according to their income and then separated into two equal-sized groups. The value that separates these groups is the median income (50th percentile).

Because the median corresponds exactly to the midpoint of the income distribution, it is not, contrary to the mean, affected by extreme income values. This is a useful feature of the median, as it allows one to abstract from unusually high values held by relatively few people.

Since income distributions are typically skewed to the left - that is, concentrated at the low end of the income scale - median income is usually lower than mean income.

## Implicit rate of government transfers or taxes

TThe implicit rate of government transfers or taxes is a way of showing the relative importance of transfers received or taxes paid for different families or individuals. This concept is similar, but not identical, to the effective rate of taxation. For a given individual or family, the effective rate is the amount of transfers/taxes expressed as a percentage of their market income, total income, or after-tax income. The implicit rate for a given population is the average (or aggregate) amount of transfers/taxes expressed as a percentage of their average (or aggregate) income.

## Family size adjustment (equivalence scale)

Family income is insufficient to understand a family's financial well-being without knowing how many people share it, so one often wants to take the family size into account. Two approaches have been used to help with analysis of family income. The first approach is to produce data by detailed family types, so that within a given family type, differences in family size are not significant. In fact, many income measures have been crossed by detailed family types in the published tables. The second approach is to take family size into account by adjusting the income amount for purposes of analysis. The major challenge of the second approach is to select an appropriate adjustment factor. While there is no single best method, it is still better to apply some kind of adjustment factor rather than no adjustment at all.

The simplest adjustment is to use per capita income: to divide the family income by family size. Per capita income, however, tends to underestimate economic well-being for larger families compared to smaller families since it assumes equal living costs for each member of the family. But some costs, primarily those related to shelter, decrease proportionately with family size and may also be lower for children than for adults. For example, the shelter costs for an adult married couple with no children are arguably not much more than those for an adult living alone.

To take such economies of scale into account, it is common to use an "equivalence scale" to adjust family incomes. Instead of implicitly assuming equal costs for additional family members, as the per capita approach does, the equivalence scale is a set of decreasing factors assigned to the first member, the second member, and so on. Dividing the income value by the sum of the factors assigned to each member derives the adjusted income amount for the family.

There is no single equivalence scale in use in Canada. The one used in the published income tables and in concepts such as the Low Income Measure (LIM) has, however, achieved a high degree of acceptance. In this equivalence scale, the factors are as follows:

- the oldest person in the family receives a factor of 1.0 ;
- the second oldest person in the family receives a factor of 0.4 ;
- all other family members aged 16 and over each receive a factor of 0.4 ; and
- all other family members under age 16 receive a factor of 0.3 .

The LIM divides by a factor of 1.4 for computing a married couple's per person income instead of a factor of 2.0 (the family size). An income of $\$ 56,000$ for a married couple would give each adult a standard of
living equivalent to that of an adult living alone who had an income of $\$ 40,000$, as compared to an adult with $\$ 28,000$ when calculated on a per capita basis.

## Gini coefficient

The Gini coefficient measures the degree of inequality in the income distribution. Gini coefficients are published for market income, total income and after-tax income, and are used to compare the uniformity of income allocation between different income concepts, across different populations or within the same population over time.

Values of the Gini coefficient can range from 0 to 1 . A value of zero indicates income is equally divided among the population with all units receiving exactly the same amount of income. At the opposite extreme, a Gini coefficient of 1 denotes a perfectly unequal distribution where one unit possesses all of the income in the economy. A decrease in the value of the Gini coefficient can, by and large, be interpreted as reflecting a decrease in inequality, and vice versa.

## Low income definitions

## Low income cut-off (LICO)

Lncome cut-offs (LICOs) are established using data from the Family Expenditure Survey, now known as the Survey of Household Spending. They convey the income level at which a family may be in straitened circumstances because it has to spend a greater proportion of its income on necessities than the average family of similar size. Specifically, the threshold is defined as the income below which a family is likely to spend 20 percentage points more of its income on food, shelter and clothing than the average family. There are separate cut-offs for seven sizes of family - from unattached individuals to families of seven or more persons - and for five community sizes - from rural areas to urban areas with a population of more than 500,000 .

## Calculation of low income cut-offs

ThThe first step in the production of a set of low income cut-offs is to calculate the average proportion of income that a family spends on food, shelter and clothing. The 1992 Family Expenditure Survey found that, on average, families spend $44 \%$ of their after-tax income (and $35 \%$ of their total "before-tax" income) on these necessities. Then, 20 percentage points are added, giving $64 \%$ of after-tax income. This is done on the grounds that a family spending more than this proportion of its income on necessities is significantly worse off than the average family. The final step is to look at the distribution of income by expenditure and determine, using a regression line, the level of income at which a family tends to spend 20 percentage points more than the average on the necessities of food, shelter and clothing.

## Updating and rebasing the low income cut-offs

There are two reference years that play a part in the calculation of a set of low income cut-offs: the base year and the income reference year. The base year supplies the average spent on food, shelter and clothing. This percentage is used to derive a set of cut-offs that are suitable for use with income data from that year. cut-offs for other income reference years may be obtained by applying the corresponding Consumer Price Index (CPI) inflation rate to the basic set of cut-offs.

Using the CPI to update the cut-offs takes inflation into account, but does not reflect any changes that might occur over time in the average spending on necessities. To measure these changes, Statistics Canada has developed a new set of spending averages after each Family Expenditure Survey. These are referred to as "bases" because the average spending on necessities in that base year drives the calculation of the cut-offs. The two most recent base years are 1992 and 1986. cut-offs based on 1992 are most commonly applied by data users and are available for the income reference years from 1980 onwards.

## Low income rate

LLow income rates can be calculated for persons or for families. In either case, the income compared to the cut-off is the income of the entire economic family. "Persons in low income" should be interpreted as persons who are part of low income families, including persons living alone whose income is below the cut-off. Similarly, "children in low income" means "children who are living in low income families". In other words, all members of an economic family have the same low income status, but they are counted separately when person-based low income rates are calculated.

To calculate the low income rates, the family size and community size are used to find the appropriate cut-off. Then the family income is compared to that cut-off. If a family low income rate is being calculated, then the family is counted as being in low income if its income is less than the cut-off. If a person low income rate is being calculated, then all persons in the family are counted as being in low income if the family income is less than the cut-off.

## Use of after-tax and before-tax LICOs

The average portion of income that families spend on food, shelter and clothing, which figures prominently in the low income cut-offs, is undoubtedly a useful gauge of economic well-being no matter which income concept is used. The choice of after-tax income, total income or market income depends on whether one wants to take into account the added spending power that a family gets from receiving government transfers or its reduced spending power after paying taxes.

Statistics Canada produces two sets of low income cut-offs and their corresponding rates - those based on total income (i.e., income including government transfers, before the deduction of income taxes) and those based on after-tax income. Derivation of before-tax versus after-tax low income cut-offs are each done independently. There is no simple relationship, such as the average amount of taxes payable, to distinguish the two types of cut-offs.

The choice to highlight after-tax rates was made for two main reasons. First, income taxes and transfers are essentially two methods of income redistribution. The before-tax rates only partly reflect the entire redistributive impact of Canada's tax/transfer system because they include the effect of transfers but not the effect of income taxes. Second, since the purchase of necessities is made with after-tax dollars, it is logical to use people's after-tax income to draw conclusions about their overall economic well-being.

## Differences in after-tax and before-tax rates

After-tax low income cut-offs and the resulting after-tax rates have been published back to 1980. The number of people falling below the cut-offs has been consistently lower on an after-tax basis than on a before-tax basis. This result may appear inconsistent at first glance, since incomes after tax cannot be any higher than they are before tax, considering that all transfers, including refundable tax credits, are included in the definition of "before-tax" total income. However, with a relative measure of low income such as the LICO, this result is to be expected with any income tax system which, by and large, taxes those with more income at a higher rate than those with less. These "progressive" tax rates compress the distribution of income. Therefore, some families in low income before taking taxes into account are relatively better off and not in low income on an after-tax basis.

## Low income gap

The low income gap, previously called "low income deficiency", is the amount that a low income family falls short of the relevant low income cut-off. For the calculation of this gap, negative incomes are treated as zero.

For example, a family with an income of $\$ 15,000$ and a low income cut-off of $\$ 20,000$ would have a low income gap of $\$ 5,000$. In percentage terms this gap would be $25 \%$. The average gap for a given population, whether expressed in dollar or percentage terms, is the average of these values as calculated for each unit.

## Market basket measure (MBM)

Human Resources Development Canada collaborated with the provincial and territorial ministries of social services to develop a "market basket measure" (MBM). The approach is to cost out a basket of necessary goods and services including food, shelter, clothing and transportation, and a multiplier to cover other essentials. The results define levels of income needed to cover the cost of the basket.

The same argument that can be made for using after-tax low income rates can be made for using after-tax income to compare to the MBM thresholds. That is, a measure of well-being should take into account what is actually available to spend. The income concept that has been proposed for comparisons with the MBM thresholds goes even further than after-tax income by also removing other non-discretionary expenses such as support payments, work-related child care costs and employee contributions to pension plans and to Employment Insurance. Statistics Canada is collecting some of the data necessary to produce rates based on the market basket measure.

## Comparisons between data up to 1995 and data since 1996

Thhe data for the historical period (years prior to the last) are not necessarily the same as in previous editions. Data up to and including 1995 are drawn from the Survey of Consumer Finances (SCF, last conducted for reference year 1997), and data for 1996 and onwards are drawn from the Survey of Labour and Income Dynamics (SLID). For this 2002 edition of tables, all other changes from the 2001 edition are very minor.

Different surveys will produce slightly different estimates on the same topics due to a variety of factors. Every attempt was made to minimize and monitor these differences between the two income surveys, while nonetheless making some important improvements in survey practices. Before replacing the SCF series with SLID, a careful study was done on the overlapping reference years, particularly the years 1996 and 1997, as SLID only acquired its full sample size in 1996. The results of the study are contained in the Income Statistics Division research paper, A Comparison of the Results of the Survey of Labour and Income Dynamics (SLID) and the Survey of Consumer Finances (SCF) 1993-1997: Update (75F002MIE99007). All ISD research papers are available free of charge on the Statistics Canada internet site (www.statcan.ca).

In short, it was found that the two surveys told essentially the same story for all of the main income concepts. It is still possible, nonetheless, that for some characteristics the data trends could reveal a "break" as a result of the change in survey. Such a break would likely appear as a noticeable upward or downward shift in a data series between the years 1995 and 1996. It represents a change in the data which is attributable to the two surveys having different samples and different methods (such as the use of tax data in the case of SLID), rather than a true change in the characteristics of the population. Users are advised to take note of the following survey differences which are known to exist and to have had an impact on the data trends at some detailed levels.

## Better coverage of small income amounts

One notable improvement that occurred as a result of new survey techniques introduced in SLID is better coverage of small income amounts received by respondents. It has been observed in surveys conducted by questionnaire that respondents tend to forget or neglect small income amounts they received in the past. This means an underestimation of income in general, and in particular, it means that many people who received a small amount of income instead report no income at all (there are differences, however, depending on whether the income concept includes or excludes government transfers).

The use of administrative income tax files in SLID for the majority of sample respondents means that there is considerably better coverage of non-zero amounts of income, and in general, a greater
number of recipients of most kinds of income. Another technique used by SLID which may have improved coverage is that, even for respondents who report income by interview instead of via their tax records, there are two chances to prompt them for income sources, and therefore a greater likelihood of capturing an amount. This is because some income concepts are touched on in the January interview and then covered in the May interview, where it is possible to remind the respondent of a positive response in January. The types of income for which such "dependent interviewing" is used are earnings (from employment or self-employment), employment insurance benefits, social assistance, and workers' compensation.

## Detailed family types

The standard published "detailed family types" for economic families have changed in one regard. In the SCF, they are derived with reference to the "head of family". In SLID, the same categories are used but in reference to the "major income earner". (See also "Major income earner" under "Family definitions" in the section on "Notes and definitions".) SLID dropped the concept of head of family entirely, as it has little relevance in a modern context. But some sort of prioritization of people within a family is useful to uniquely identify the type of family, even if it is somewhat arbitrary.

The change in family concepts resulting from the transition from SCF to SLID has not affected data produced for the entire population of families consisting of two or more persons. However, for some of the detailed family types, the estimated number of families underwent a one-time increase or decrease between 1995 and 1996. Without drawing conclusions about the precise net effects of these changes, the following points can be made.

First, whereas the previous definition always gave husbands the status of head of family rather than wives, with the major income earner concept there is no distinction by sex, and it is possible for the wife to qualify. Since it still holds that wives are on average younger than husbands at least for older couples, this has caused a shift from elderly families to non-elderly families.

Second, the head of family concept gave preference to parents over their adult children and, where there is no husband-wife or parent-child relationship in the family, it gave preference to older members over younger ones. Now, younger adults are much more likely to qualify as major income earners than they did as heads of families. As a result, we see significant decreases in the number of "other elderly families" and "married couples with other relatives", and a large increase in the number of "other non-elderly families". (See the section "Family definitions" for the precise definitions of family types.)

## Comparisons with previous editions

The data for years prior to 2002 are not necessarily directly comparable to those of the 2001 edition. For example, dollar amounts are always expressed in constant dollars of the latest reference year. (See "Current dollars versus constant dollars" under "Analytical Concepts".) With the 2002 edition of this publication, data for 2001 were revised

The Survey of Labour and Income Dynamics uses estimates of the target population - which are derived independently from the survey - as benchmarks for producing survey estimates. These population estimates start with a Census and are then updated using administrative data to reflect the current population of Canada. Using these population counts reduces the sampling error and coverage bias of survey estimates. It also provides consistency of estimates across household surveys. Accurate population numbers are crucial in determining estimates from a sample survey like SLID. In order to translate the results of the survey into population estimates, each individual in the sample is assigned a weight indicating the number of persons in the population represented by that sample member.

Periodically, the weights used in the survey are updated to reflect the availability of new population benchmarks provided by a new census and new annual inter-censal estimates. When this happens,
the weights are revised historically in order to maintain a consistent time series. Methodological improvements in the derivation of weights may also be implemented in a weight revision.

The most recent historical weight revision for the Survey of Labour and Income Dynamics occurred with the release of data for 2000. It was carried out on data back to 1980, such that figures for the entire time series changed. Traditionally, weights are derived using population benchmarks by province, age and sex. Since the 2000 weight revision, the weights in SLID also respect population benchmarks by household size and economic family size.

## Methodology

## Survey universe

S
SLID is a household survey that covers all individuals in Canada, excluding residents of the Yukon, the Northwest Territories and Nunavut, residents of institutions and persons living on Indian reserves. Overall, these exclusions amount to less than three percent of the population.

## The sample

TThe samples for SLID are selected from the monthly Labour Force Survey (LFS) and thus share the latter's sample design. The LFS sample is drawn from an area frame and is based on a stratified, multi-stage design that uses probability sampling. The total sample is composed of six independent samples, called rotation groups, because each month one sixth of the sample (or one rotation group) is replaced.

The SLID sample is composed of two panels. Each panel consists of two LFS rotation groups and includes roughly 15,000 households. A panel is surveyed for a period of six consecutive years. A new panel is introduced every three years, so two panels always overlap.

## Data quality

There are two types of errors inherent in sample survey data, namely, sampling errors and non-sampling errors. The reliability of survey estimates depends on the combined impact of sampling and non-sampling errors.

## Sampling errors

S
Sampling errors occur because inferences about the entire population are based on information obtained from only a sample of the population. The results are usually different from those that would be obtained if information were collected from the whole population. Errors due to the extension of conclusions based on the sample to the entire population are known as sampling errors. The sample design, the variability of the population characteristics measured by the survey, and the sample size determine the magnitude of the sampling error. In addition, for a given sample design, different methods of estimation will result in sampling errors of different sizes.

## Standard error and coefficient of variation

A
common measure of sampling error is the standard error (SE). The standard error measures the degree of variation introduced in estimates by selecting one particular sample rather than another of the same size and design. The standard error may also be used to calculate confidence intervals associated with an estimate $(\mathrm{Y})$. Confidence intervals are used to express the precision of the estimate. It has been demonstrated mathematically that, if the sampling were repeated many times, the true population value would lie within the confidence interval $\mathrm{Y} \pm 2$ SE 95 times out of 100 and within the narrower confidence interval defined by $\mathrm{Y} \pm \mathrm{SE}$, 68 times out of 100. Another important measure of sampling error is given by the coefficient of variation, which is computed as the estimated standard error as a percentage of the estimate Y (i.e., 1007 SE / Y).

To illustrate the relationship between the standard error, the confidence intervals and the coefficient of variation, let us take the following example. Suppose that the estimated average income from a given source is $\$ 10,000$, and that its corresponding standard error is $\$ 200$. The coefficient of
variation is therefore equal to $2 \%$. The $95 \%$ confidence interval estimated from this sample ranges from $\$ 9,600$ to $\$ 10,400$, i.e. $\$ 10,000 \pm \$ 400$. Thus it is assumed with a $95 \%$ degree of confidence that the average income of the target population is between $\$ 9,600$ and $\$ 10,400$.

The bootstrap approach is used for the calculation of the standard errors of the estimates. For more information on standard errors and coefficients of variation, refer to the Statistics Canada publication, Methodology of the Canadian Labour Force Survey.

## Suppression rules

S
uppression rules, or data reliability cutoffs, are currently established based on the sample size that underlies the estimate. In general, a sample size of 25 observations is required for the estimate to be published. Depending on the type of estimate, this rule can vary slightly. These rules help protect the confidentiality of survey respondents and ensure the reliability of estimates.

## Estimate <br> Supress IF:

Percentage, distribution, proportion/shares

```
- % under the low-income cutoff
Denominator* sample size < 25
(LICO)
- Income distribution
- Proportion of families with
income=0
Denominator* sample size < }100\mathrm{ and numerator sample
size < 5
```

## Ratios

Numerator sample size < 25

- female/male earnings
or
Denominator sample size < 25
Quintiles (shares, means and upper income limits)
- shares of income by quintile
- average income by quintile
- upper income limits

## Other estimates

- Counts
- Mean
- Medians sample size $<25$
- Gini coeficients
sample size of all quintiles/5 < 25
or
upper income limit for upper income quintile or total of quintiles

## Non-sampling errors

Non-sampling errors generally result from human errors such as inattention, misunderstanding or misinterpretation. The impact of randomly occurring errors over a large number of observations will be minimal. Errors occurring systematically can, on the other hand, have a major impact on the reliability of estimates. Considerable time and effort is invested into reducing non-sampling errors in SLID.

Non-sampling errors may arise from a variety of sources such as coverage, response, non-response and processing errors.

Coverage error arises when sampling frame units do not exactly represent the target population. Units may have been omitted from the sampling frame (under-coverage), or units not in the target population may have been included (over-coverage), or units may have been included more than once (duplicates). Under-coverage represents the most common coverage problem.

Slippage is a measure of survey coverage error. It is defined as the percentage difference between control totals (Census population projections) and weighted sample counts. Slippage rates for household surveys are generally positive because some people that should be enumerated are missed. Slippage rates have been revised back to 1996 using the 1996 Census population projections. According to the numbers in the table below, in 2002, SLID covered $84 \%$ of its target population. SLID estimation procedures use Census population projections to compensate for determined slippage.

Rates are also available upon request for sex, province and age groupings.
Text Table 1
Slippage rates in SLID

|  | 1997 | 1998 | 1999 | 2000 | 2001 | 2002 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | percent |  |  |  |
| Canada | 11.12 | 11.85 | 12.02 | 12.64 | 13.40 | 16.02 |

Response errors may be due to many factors, such as faulty questionnaire design, interviewers' or respondents' misinterpretation of questions, or respondents' faulty reporting. Great effort is invested in SLID to reduce the occurrence of response error. Measures undertaken to minimize response errors include the use of highly-skilled and well-trained interviewers, and supervision of interviewers to detect misinterpretation of instructions or problems with the questionnaire design. Response error can also be brought about by respondents who, willingly or not, provide inaccurate responses.

Income data are especially prone to misreporting, as income is a sensitive issue and includes many items with which respondents are not always familiar. To obtain more accurate information, income data for SLID are collected after the income tax "season" when respondents are more familiar with their tax records. Respondents receive information about the income interview prior to the interviewer's telephone call. This gives them time to consult documents and have information available at the time of the interview. For respondents who grant Statistics Canada permission to access their tax files (the majority of respondents), SLID collects income data directly from administrative files. This procedure reduces misreporting of income in the SLID.

Non-response errors occur to some extent in any survey for reasons such as household members being on vacation during the interview period or refusing to supply requested information, despite attempts to obtain complete response from sampled units. For these individuals, the missing data are imputed either explicitly by assigning data to each non-respondent on the basis of a similar respondent record, or implicitly by redistributing the weight of the non-respondent individual to other responding individuals. The bias introduced by non-response increases with the differences between respondent and non-respondent characteristics. Methods employed to compensate for non-response make use of information available for both respondents and non-respondents in an attempt to minimize this bias.

Processing errors can occur at various stages in the survey: data capture, editing, coding, weighting or tabulation. The computer-assisted collection method used for SLID reduces the chance of introducing capture errors because checks for consistency and completeness of the data are built into the computer application. To minimize coding, weighting or tabulation errors, diagnostic tests are carried out periodically. These tests include comparisons of results with other data sources.

## Weighting

The estimation of population characteristics from a survey is based on the premise that each sampled unit represents, in addition to itself, a certain number of unsampled units in the population. A basic survey weight is attached to each record to indicate the number of units in the population that are represented by that unit in the sample.

Two types of adjustment are then applied to the basic survey weights in order to improve the reliability of the estimates. The basic weights are first inflated to compensate for non-response. The non-response adjusted weights are then further adjusted to ensure that estimates on relevant population characteristics would respect population totals from sources other than the survey.

The population totals used for SLID are based on Statistics Canada's Demography Division population counts for different province-age-sex groups as well as counts by household and family size. In SLID, different weights apply for cross-sectional and longitudinal estimates.

## Cross-sectional representation in SLID

E
Each longitudinal sample, or "panel" in SLID initially constitutes a representative cross-sectional sample of the population. However, because the real population changes each year, whereas by design the longitudinal sample does not, the sample must be modified to properly reflect these changes to the composition of the population. This is done by adding to the sample all new people in the population who are found to be living with the initial respondents (and likewise dropping them from the sample if they leave at later time-points).

Any original respondents who leave the target population (by moving abroad, into institutions, etc.) are given a zero weight for cross-sectional purposes. In this way, the cross-sectional sample, composed of the original respondents minus those who left the target population plus those who have entered it, is virtually fully representative of the population at each subsequent time-point. The missing group is composed of persons who have newly entered the target population and are not living with anyone who was in the target population when the most recent panel was selected. Since SLID introduces a new panel every three years, however, this group is quite small.

## Response rates

High response rates are essential for the data quality of any survey and thus considerable effort is invested to encourage effective participation from SLID respondents.

Response is calculated at the household level. A household is considered to be "respondent" if at least one of its members responds to either the January or the May interview. There is the additional stipulation that the information on the household's composition cannot be missing for more than one year.

Within a respondent household, all members are assigned identical, positive final weights, and those members (if any) who did not respond to one or both of the collection phases will have final data that is either shown as "missing" on the final database or imputed, depending on the variable.

Cross-sectional response rates, given in text table 2, range between $79.1 \%$ (2002) and 85.5\% (1996).
Text Table 2
Response rate in SCF (1990-1995) and SLID (1996-2002)

|  | 1990 | 1991 | 1992 | 1993 | 1994 | 1995 | 1996 | 1997 | 1998 | 1999 | 2000 | 2001 | 2002 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | percent |  |  |  |  |  |  |  |  |  |  |  |  |
| Response Rate | 79.0 | 80.0 | 80.7 | 80.0 | 79.5 | 82.1 | 85.5 | 83.6 | 82.3 | 82.8 | 80.8 | 79.1 | 79.1 |

## Imputation for non-response

Income data are imputed using previous years' data updated for any changes in circumstances. In the absence of previous years' data, data is imputed using the "nearest neighbour" technique, in which a respondent with certain similar characteristics becomes the "donor" for the imputed value.

Amounts received through certain government programs, such as child tax benefits, the Goods and Services Harmonized Sales Tax Credit, and the Guaranteed Income Supplement, are also derived from other information. Data obtained from the tax route are complete and do not need imputation.

## Survey content

SLID collects data on a wide range of topics. Some are inherently "dynamic", involving transitions and spells, while others have important explanatory value.

The content themes are shown in Figure 1:

- Labour
- Income and wealth
- Education
- Personal characteristics

For more detailed information on survey variables, refer to the SLID electronic data dictionary.
Figure 1
Organization of SLID content

## Labour

## Labour market activity

- major activity during year
- employment/unemployment spells (start and end dates, durations)
- weekly labour force status
- total weeks of employment, unemployment and inactivity by year
- multiple job-holding spells
- work absence spells

## Work experience

- years of full-time and part-time employment
- years of experience in full-time, full-year equivalents

## Jobless periods

- job search during spell
- dates of search spells
- desire for employment
- reason for not looking

## Job characteristics*

- start and end dates, first date ever worked for this employer
- wages
- work schedule (hours and type)
- benefits
- union membership
- occupation
- supervisory and managerial responsibilities
- class of worker
- tenure
- how job was obtained
- reason for job separation
*Job characteristics are updated annually for up to six jobs per year with dates of change recorded.

## Absences from work*

- absence dates
- reason
- paid or unpaid
*Absences lasting one or more weeks are collected on the first and last absence each year, for each employer.

## Employer attributes

- industry
- firm size
- public or private sector

Income and Wealth
Income source

- annual information on about 25 income sources
- market income
- government transfers
- taxes paid
- after-tax income

Receipt of Employment Insurance/social assistance/workers compensation*

- Employment Insurance
- social assistance
- workers' compensation
*Amount and timing of monthly benefits received from each source.

## Education

## Educational activity

- enrolled in a credit program, months, weeks and hours attended
- type of institution
- full-time or part-time student
- certificates received (if applicable)
- job-related training courses, seminars, workshops and conferences

Level of schooling/educational attainment*

- years of schooling
- degrees and diplomas
- major field of study
*Updated annually

## Personal characteristics

## Demographics

- year of birth/age
- sex
- duration of current marital status
- year/age at first marriage

## Ethno-cultural

- ethnic background
- member of an employment equity designated group
- mother tongue
- date of immigration
- country of birth
- parents' schooling and place of birth

## Activity limitation

- annual information on activity limitations and their impact on working
- satisfaction with work

## Information on children

- number of children born, raised
- year and person's age when first child born

## Geography and geographic mobility

- economic region or census metropolitan area of current residence
- size of community
- moved during year
- move dates
- reason for move
- nature of move (full household/household split)

## Household and family information*

- key characteristics of other household/family members (e.g., age, sex, relationship, income, annual hours worked)
- relevant low-income cutoff
- family events (marriage, separation, deaths, births)
- dwelling type, characteristics, housing condition
- dwelling tenure, mortgage, rent payments
*Annual summary information, e.g., size, type

[^0]:    1. Administrative data on Employment insurance payments by type are published every month by Statistics Canada's Employment insurance statistics program They can be accessed in The Daily or CANSIM table 276-0005.
[^1]:    See footnotes at the end of the table.
