Note of appreciation

Canada owes the success of its statistical system to a long standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

User information

Symbols

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0^s value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- p preliminary
- r revised
- x suppressed to meet the confidentiality requirements of the *Statistics Act*
- E use with caution
- F too unreliable to be published

Note

Components may not add to totals due to rounding.

Highlights

May 2007

- New motor vehicle sales declined 0.8% nationally in May, with five provinces recording increases and five reporting decreases.

Analysis – May 2007

New motor vehicle sales declined 0.8% nationally in May, with five provinces recording increases and five reporting decreases. Seasonally adjusted data from the New Motor Vehicle Sales Survey put the level of sales at 145,496 units. The decline in May was not strong enough to offset the 6.3% increase in April, and May sales were 7.5% higher than they were a year earlier.

Chart 1
New motor vehicle sales, seasonally adjusted, in units, 2004 to 2007

1. Trends represent smoothed seasonally adjusted data.

Overall, the decline in May was entirely due to passenger cars, as sales of trucks (which include minivans, sport-utility vehicles, light and heavy trucks, vans and buses) posted an increase.

Preliminary data from the automotive industry indicate that sales fell 1% in June.

North American-built passenger cars edge down

Passenger car sales were down almost 2,000, or 2.5%, units in May. The sales level of 73,354 units was still the second highest recorded this year as the first three months of 2007 were relatively flat before the increase in April.

The decline in passenger car sales was driven by a 5.6% drop in the number of North American-built units sold. Slightly offsetting this decline was a 3.3% increase in sales of overseas-built models, after almost no change was recorded in April. So far in 2007, only April has seen an increase in sales of North American-built cars, while overseas-built cars have recorded increases in three of the first five months.

Sales of trucks grew 1.0% in May and remained above the 70,000 mark, as in April. This was only the second time since the beginning of the series in 1946 that the number of trucks sold rose above 70,000 for two consecutive months. The last time this occurred was in December 2006 and January 2007.

Sales of new motor vehicles were volatile across provinces

Of the four provinces with the highest sales, only Quebec posted an increase in May, its sales rising 3.9% to 37,283 units. After a strong showing in April, gains in Quebec have more than offset the declines observed in the first three months of 2007.

Sales in Ontario declined 3.2% to 51,970, giving back some of the gains made in April. New motor vehicle sales in Ontario have declined in four of the first five months of 2007.

Both Alberta (-0.4%) and British Columbia (-2.4%) experienced declines in May, with new motor vehicle sales in Alberta falling to 21,323 units and British Columbia sales decreasing to 17,274.

The provinces with the largest and smallest percentage changes were both in Eastern Canada, as sales in New Brunswick increased 10.1% while those in Nova Scotia declined 14.2%. The increase in New Brunswick came after small changes in March and April and completely offset a decrease posted in February. The decline in Nova Scotia completely neutralized gains from the previous month.

Definitions

Trucks

Trucks include light and heavy trucks, minivans, sport utility vehicles, vans, coaches and buses, regardless of their intended use.

Passenger car

The term passenger car refers to all vehicles whose primary function is to carry passengers, excluding those vehicles classified as a commercial vehicle (see definition above). Passenger cars also include cars used for commercial purposes, i.e. taxis, auto rentals and other car fleets.

Country of origin

New motor vehicles fall into two categories defined on the basis of origin: those manufactured in North America and those manufactured overseas. The latter are imported in a fully assembled state from countries other than the United States or Mexico. All passenger cars and commercial vehicles assembled in Canada, Mexico and the United States and sold in Canada classified are as North American manufactured vehicles.

Motor vehicle sales - units

The number of new motor vehicles sold in Canada.

Motor vehicle sales - dollars

Net sales refers to the selling price to the consumer, i.e., manufacturer's invoice price plus estimated dealer's markup, including charges for standard and optional accessories. Sales taxes are excluded.

Average price of passenger cars

The average price is obtained by dividing the total dollar sales by the number of units sold. Therefore, changes in the average price reflect variations in the models sold as well as price changes. For example, an increase in the average price for passenger cars may reflect both a shift to more expensive models as well as price increases.

Appendix I

Scope of the survey

The interest in and need for detailed statistics on the automobile industry arose years ago, when the industry began playing a prominent role in the Canadian economy. For over 50 years, Statistics Canada has been collecting and disseminating statistical information on the retail sales of new motor vehicles. Not only are these statistics required to produce estimates of Canadian consumer spending for the national accounts and the gross domestic product, but they have also served and continue to serve as one of the most important, most often requested indicators of the health of Canada's economy.¹

However, estimates of the total retail sales volume of new motor vehicles were not sufficient to meet the incessant demand for more information. There came an increasing need for data on the characteristics of the fleet of new vehicles sold at retail, either to learn more about the preferences of Canadian consumers or to assess the penetration of the Canadian market by major foreign manufacturers. Statistics on new motor vehicle sales were expanded in the early 1970s to provide separate figures for Japanese vehicle sales.

The statistics in this report cover exclusively retail sales of new motor vehicles within Canada's borders. Data are derived from a postal survey (a census - see the methodology section at the end of the report for more details).

Other statistics connected with the automobile industry (sales of new and used car dealers, auto parts and accessories stores and so on) are available on the monthly Retail Trade survey (Catalogue No. 63-005). For further information, please contact the Retail Commodity Section, Distributive Trades Division, Statistics Canada, Ottawa, K1A 0T6, (Telephone: 613-951-3549 or toll free at 1-877-421-3067).

Data quality and methodology

This survey is a census of all motor vehicle manufacturers and importers known to be active in Canada.

The value of sales is reported at selling price to consumer (i.e. the manufacturer's invoice price plus estimated dealer's markup, charges for standard equipment and options, less provincial sales tax and federal goods and services tax (G.S.T.) and harmonized sales tax (H.S.T.)).

The response rate for this survey is generally 100%. Minimal estimation is required so there is little bias resulting from non-response introduced in these data.

All attempts have been made to minimize the non-sampling errors: the questionnaires used in the survey have been carefully designed to minimize different interpretations; detailed acceptance testing has been carried out for the different stages of editing and processing.

Data confidentiality

Statistics Canada is prohibited by law from publishing any statistics which would divulge information relating to any identifiable business without the previous consent in writing of that business.² The disclosure of data likely to reveal specific information on the activity of a particular company is systematically and rigorously controlled and regulated to prevent the publication or disclosure of any information deemed confidential. The rules regarding confidentiality

1. *The new motor vehicle sales series is one of ten statistical series making up the leading indicator developed by Statistics Canada for current economic analysis purposes.*

2. *See Section 17 of the Statistics Act (Chapter 5-19), entitled «Secrecy».*

are therefore applied in such a way that no data are shown for cells (or statistical units). If information is withheld for reasons of confidentiality an "X" will appear in the appropriate cell of this publication.

Another way of preserving data confidentiality without having to enter an "X" is to combine (consolidate) the information **from selected regions** (or selected cells) for the same item. The data in question can be aggregated and published in a less detailed, but still confidential, form. For example, the data for the Northwest Territories, the Yukon and Nunavut are included with the British Columbia data.

Seasonal adjustment

Time series contain the elements essential to the description, explanation and forecasting of the behaviour of an economic phenomenon: "They are statistical records of the evolution of economic processes through time."³In using time series to observe economic activity, economists and statisticians have identified four characteristic behavioural components: the long-term movement or trend, the cycle, the seasonal (variations) and the irregular (fluctuations). These movements are caused by various economic, natural or institutional factors. The **seasonal variations** occur periodically on a more or less regular basis over the course of the year as a result of seasonal changes in weather, statutory holidays and other events which occur at fairly regular intervals and thus have a major impact on the rate of economic activity.

In the interest of accurately interpreting the fundamental evolution of an economic phenomenon and producing forecasts of superior quality, Statistics Canada uses the X-11-ARIMA seasonal adjustment method⁴ to seasonally adjust its time series. The ARIMA part of this method minimizes the impact of seasonal variations on the series and essentially consists of adding one year of estimated data onto each end of the original series before it is seasonally adjusted per se. The estimated data are derived from forecasts and back casts using ARIMA (Autoregressive Integrated Moving Average) models of the Box-Jenkins type.

The X-11 part of the X-11-ARIMA program uses primarily the ratio-to-moving average method to smooth the modified series and obtain a preliminary estimate of the trend-cycle, to calculate the ratios of the original series (fitted) to the estimates of the trend-cycle and to estimate the seasonal factors from these ratios. The final seasonal factors are produced only after these operations have been repeated several times. These procedures, used to determine the seasonal factors necessary to calculate the final seasonally adjusted data, are, since February 1983, executed every month instead of once a year. This permits us to update each month, the reference series from which we derive the final estimations of the seasonal factors employing the most current data available.

While seasonal adjustment permits a better understanding of the underlying trend-cycle of a series, the seasonally-adjusted series still contains an irregular component. Slight month-to-month variations in the seasonally adjusted series may be simple irregular movements; to get a better idea of the underlying trend, users must examine several months of seasonally adjusted series.

To assist the user, the Months of Cyclical Dominance number, MCD, is provided.⁵ The MCD is the shortest monthly span for which a certain ratio becomes and remains less than one, that is, the ratio for which the absolute average percentage change of the trend-cycle of the seasonally adjusted series becomes greater than the absolute average per cent change of the irregular component. The MCD can be interpreted as the number of months over which a change in the seasonally adjusted series must move in a given direction before one can be reasonably certain that the trend-cycle of that series also has moved in the given direction. Clearly small MCD's are desirable and indicative of a smooth series. Applying a moving average to the seasonally adjusted data of MCD length tends to smooth irregular movements which may obscure the underlying trend-cycle. The MCD moving average provides a method of reducing all types of series to approximately the same degree of smoothness, whatever the size of the irregular component in the original series.

3. «A Note on the Seasonal adjustment of Economic Time Series,» *Canadian Statistical Review*, August 1974.

4. For further information see the X-11-ARIMA/88 Seasonal Adjustment Method, by Estelle Bee Dagum, Statistics Canada.

5. MCD = 10 for North American passenger cars. MCD = 4 for Overseas passenger cars. MCD = 12 for Commercial vehicles.

Revision procedures

The seasonally adjusted estimates are revised for the three months preceding the reference period. Monthly unadjusted data are revised for the previous month, when new information is made available to Statistics Canada. In addition, unadjusted new motor vehicle sales are revised each year, for the latest year, in the February issue of this publication. At that time, monthly seasonally adjusted estimates for the latest four years of data are revised.
