#### Note of appreciation

Canada owes the success of its statistical system to a long standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

## **User information**

#### **Symbols**

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0s value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- p preliminary
- r revised
- x suppressed to meet the confidentiality requirements of the Statistics Act
- E use with caution
- F too unreliable to be published

#### **Custom tabulations of SLID data**

For clients with specialized data needs, custom tabulations can be produced on a cost-recovery basis. Contact Client Services, Income Statistics Division (1 (888) 297-7355 or (613) 951-7355; income@statcan.ca).

The Average tables our available free of charge on request.

#### Remote access to SLID data

Remote access is an initiative that enables external researchers to access and use SLID data.

Under this arrangement, researchers contact the Income Statistics Division to indicate their interests in remote access to SLID data and provides a short abstract outlining the objectives for their research. Upon approval of their access request, researchers are provided with a copy of the SLID retrieval software (SLIDRET), as well as an empty SLID database structure.

Researchers write and test their own computer programs, then send these programs to Statistics Canada over the Internet. We submit their programs, vet the output for confidentiality, and e-mail the results back. This process opens up our complex data set to even more researchers and increases research volume.

This service is an alternative to Statistics Canada's Research Data Centres and regional offices.

Contact Client Services, Income Statistics Division (1 (888) 297-7355 or (613) 951-7355; income@statcan.ca).

#### **Research Data Centres**

Research Data Centres are part of an initiative by Statistics Canada, the Social Sciences and Humanities Research Council (SSHRC) and university consortia to help strengthen Canada 's social research capacity and to support the policy research community.

## **Highlights**

- In 2005, median after-tax income rose slightly by 1.6% from 2004 to \$56,000, after adjusting for inflation, for most Canadian families with two or more people. Median after-tax income of unattached individuals remained stable at \$21,400 in 2005.
- · For the second consecutive year, Alberta families had the highest median after-tax income. Alberta families reported a median of \$64,700 compared with \$61,000 for Ontario families. Both were well above the national median of \$56,000.
- · Median market income of both families and singles remained virtually unchanged between 2004 and 2005. In 2005, the median market income of two-parent families with children was \$72,800.
- The 20% of Canadian families and unattached individuals who took home the highest amount of after-tax income in 2005 collectively paid almost 60% of all personal income taxes that year, up from 50% in 1980. This change reflects, in part, increases in their share of total after-tax income and the redistributive nature of Canada's personal income tax systems.
- An estimated 655,000 Canadian families were living in low income in 2005, 7.4% of all families. Some 788,000 children under 18 were living in low-income families, 11.7% of the total.

#### SLID data also showed:

- · Average after-tax income in 2005 was \$128,200 for the 20% of families with the highest incomes, compared with \$22,800 for 20% with the lowest.
- · The gap between the families with the lowest and highest incomes, an indication of income inequality, widened during the past decade. The gap between the top and bottom quintiles started at \$83,800 in 1980, and fluctuated between \$79,500 and \$84,500 until 1996. By 2005, the gap had reached \$105,400.
- In 2005, the average market income for families in the highest quintile was 12.8 times higher than those in the lowest quintile. However, once all government transfers are distributed, this ratio fell to 6.9 times higher. After taxes the average income for families in the highest quintile was 5.6 times higher than their counterparts in the lowest.
- Female lone-parent families saw a decline in their low income rates, from 36.0% in 2004 to 29.1% in 2005. This reflects an upward trend in market income in recent years driven by higher earnings and a larger proportion of earners.
- In 2005, about 3.4 million people were in low income. They accounted for 10.8% of all Canadians in 2005, compared with 11.4% in 2004 and well below the peak of 15.7% in 1996.
- In 2005, 320,000 children, just under one-half of all the children in low-income families, lived in female lone-parent families. However, the low-income rate for these children fell from 40.4% in 2004 to 33.4% in 2005.

## Introduction

This report examines economic family income and low income in Canada. The data prior to 1996 are drawn from the Survey of Consumer Finances. Beginning with 1996, the data are taken from the Survey of Labour and Income Dynamics.

Note that this report analyses family income on the basis of medians. The median is the point at which half of families had higher income and half less. All figures included in this report (unless otherwise stated) are sample survey estimates. To factor in inflation when comparing income levels across time, all income estimates are expressed in constant dollars of 2005.

A follow-up report, to be published shortly, focuses on the low income experience of unattached Canadians aged 18 to 64.

## **Analysis**

#### After-tax income: Median for Canadian families up slightly to \$56,000.

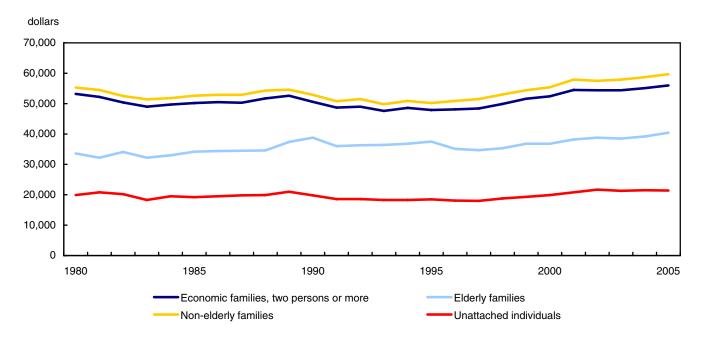

The 2005 median after-tax income for Canadian families with two or more people rose 1.6% to \$56,000, after adjusting for inflation, according to new SLID data. This slight increase in after-tax income came on the heels of a 1.3% gain in 2004.

Though most family types shared in the increase in after-tax income, this was not the case for senior families and unattached individuals. Among senior families – those in which the main income earner was aged 65 and over – median after-tax income remained virtually unchanged at \$40,400 in 2005. However, this represented a 15% increase in real terms relative to 1996 – mostly the result of a five year upward trend that started in 1997.

Median after-tax income of "unattached individuals" or singles remained stable at \$21,400 in 2005. During the last two decades, the proportion of Canadians who live as "unattached individuals" increased from 11% of the population in 1985 to 14% of the population in 2005.

Seniors living on their own received a median after-tax income of \$19,600 in 2005. These figures were virtually unchanged from 2004.

Chart 1
Median after-tax income by family types, Canada, 1980 to 2005

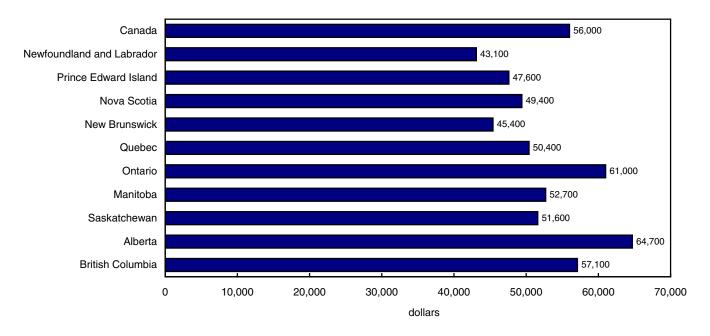

#### Provincial family income: Alberta families had highest median income for the second consecutive year

For the second consecutive year, Alberta families with two or more people had the highest median after-tax income. After tying with Ontario families in 2003, Alberta families took the lead in 2004 and saw their lead increase in 2005. Alberta families took home a median of \$64,700 versus \$61,000 for Ontario families while the national median settled at \$56,000.

Quebec families saw a 3.5% increase of their after-tax income to a level of \$50,400 in 2005. After-tax income was virtually unchanged in all other provinces. After-tax income for British Columbian families, at \$57,100, overtook the national median in 2005. Newfoundland and Labrador families had the lowest after-tax income at \$43,100.

Chart 2
Median after-tax income, families of two persons or more, Canada and provinces, 2005

#### Market income: Lion's share of income for families

Canadian families earned the lion's share of their total income<sup>1</sup> from market income. Market income is the sum of earnings from employment, investment income and private retirement income.

In 2005, market income made up nearly \$90 out of every \$100 of total income. The remaining \$10 came from government transfers.

These proportions varied among different families, especially between senior families and non-senior families.

Among non-senior families, earnings made up the largest share of total income. For every \$100 of total income, non-senior families received \$93 in market income, and the remaining \$7 from government transfers. The \$93 of market income comprised \$85 from earnings, \$3 from investment income, \$3 from private pensions and \$2 from other income.

In comparison, senior families relied less on earnings, receiving almost six times as much of their total income from government transfers compared to non-seniors families. For every \$100 of total income in 2005, they received \$40 from government transfers and only \$60 from market income. The \$60 of market income is broken down into \$14 of earnings, \$11 of investment income, \$33 of private pensions and \$2 in other sources of income.

<sup>1.</sup> To allow for international comparisons, SLID uses total income, a pre-tax income concept that excludes capital gains.

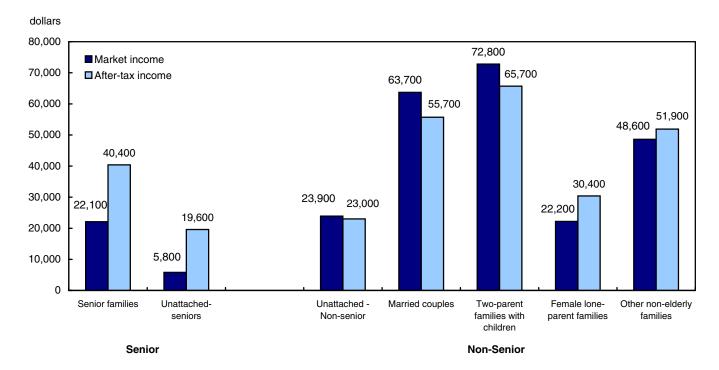

Chart 3
Median market and after-tax income by family types, Canada, 2005

#### Market income remained virtually unchanged

At the Canada level, median market income of both families and singles remained virtually unchanged between 2004 and 2005. In 2005, families received median market income of \$57,700 while singles received \$18,100.

The level of market income of non-senior families continued to vary by family type. In 2005, the median market income of two parent families with children was \$72,800; couples without children received \$63,700; while other families received \$48,600.

The median market income of female lone-parent families, at \$22,200, remained virtually unchanged from 2004. However, this group saw a significant increase in their market income compared to their 25-year low of \$8,600 received in 1996. Much of the gain experienced in the last decade reflects higher earnings and a larger proportion of working mothers.

Senior families received a median of \$22,100 in market income in 2005, showing little change from 2004. Between 1996 and 2005, the market income of the average senior family rose 30% after adjusting for inflation. This reflects, in part, growth in employment during this period among seniors aged 65 to 69. According to the Labour Force Survey, in 2005, employment rose faster for seniors in this age group than for any other age group continuing a trend that started in 2001.

#### Stability in taxes and transfers

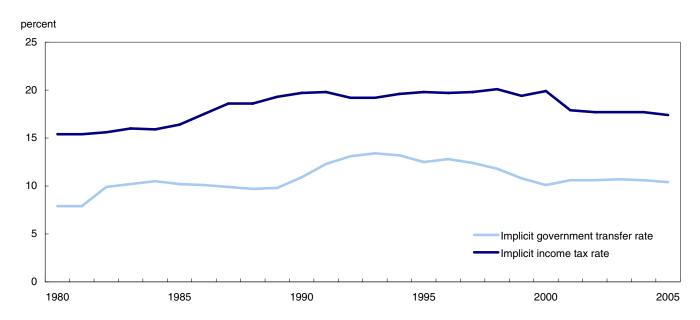

In 2005, Canadian families and unattached individuals saw little change in their median taxes and government transfers as compared to 2004. However, there were noticeable changes over the 25 year period from 1980 to 2005, reflecting economic recessions and booms, changes in tax and transfer programs, and changes in demographic factors such as family composition, student status, and population aging.

In the 1980s, the Canadian economy experienced a brief recession early in the decade and major federal tax reforms in 1987 which broadened the tax base, reduced full-inflation indexation to indexation only in excess of 3%, and reduced the number of tax brackets from 10 to 3. The early 1990s brought another recession leading to a fall in implicit taxes and a rise in implicit government transfers. During this decade, Canadian governments also moved from universal transfers to more targeted income-based transfers. The 2000s saw in 2001 a mild recession, and another major federal tax reform with reductions in all tax brackets, increases in the income thresholds at which the tax brackets apply, a return to full-inflation indexation of the tax system, and more generous tax credits aimed at particular groups, such as students and persons with disabilities.

For Canadian families, average personal income taxes as a share of average total income – the implicit tax rate – rose during the 1980s, stabilized during the 1990s, and fell during the 2000s. The implicit government transfer rate – the average government transfer as a share of average total income – rose during the first few years of each decade, stabilized, then fell towards the end of the decade.

By 2005, for every \$100 in total income received by Canadian families, an average of \$10 came from government transfers compared to the 25-year low of \$8 in 1980 and highs of \$13 in the early 1990s. Canadian families paid \$17 of every \$100 in personal income taxes in 2005, compared to a low of \$15 in 1980 and a high of \$20 in 1998.

Chart 4 Implicit income tax and government transfer rates for families, Canada, 1980 to 2005

Unattached Canadians saw relatively stable implicit tax rates during the 25-year period from 1980 to 2005. By contrast, their implicit government transfer rate rose from 1980 to a peak in 1994, and fell afterwards.

By 2005, for every \$100 in total income received by unattached individuals, this group received an average of about \$16 in government transfers and paid about \$16 in personal income taxes, compared to a receipt of about \$14 in transfers and payment of about \$14 in income taxes in 1980. The equality of implicit tax and transfer rates in 1980 and 2005 largely reflected income redistribution within this group from non-seniors to seniors without earnings. During much of the 1990s, however, unattached Canadians received as a group more in transfers than they paid in taxes.

Unattached Canadians received a higher share of their total income from government transfers, and paid a smaller share of this income in income taxes, largely because they earn lower incomes than Canadian families. These lower earnings arise in part because this group includes a higher proportion of seniors, students, and young workers at the early stage of their careers.

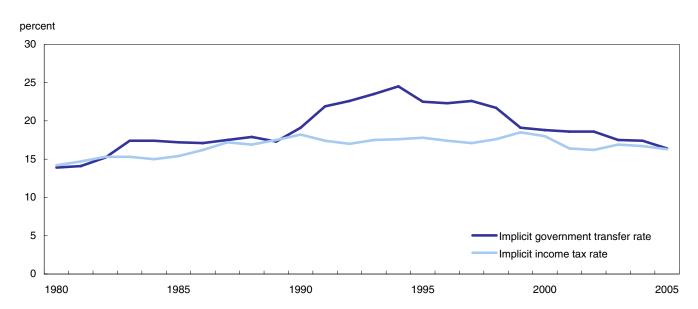

Chart 5 Implicit income tax and government transfer rates for individuals, Canada, 1980 to 2005

#### Share of highest income quintile has risen in the last 25 years - mostly in the 1990's

Throughout the last 25 years, families in the top income quintile received between 40% and 46% of aggregate market income; between 38% and 42% of total (pre-tax) income; and between 37% and 40% of after-tax income. The shares of family income received by this group generally rose during this quarter century. The share of the fourth quintile remained relatively constant at between 23% and 24% throughout the period, while the shares received by each of the three remaining quintiles fell, but by less than 2% each.

During the same 1980 to 2005 period, unattached in the top quintile received between 50% and 56% of market income; between 45% and 48% of total income; and between 42% and 44% of after-tax income. Both unattached Canadians and Canadian families experienced a growth in income inequality between 1980 and 2005.

#### Income inequality rises: Gap widens between the lowest- and the highest-income families

The increase of the shares in highest quintiles contributed to an increase in the average income gap, after-taxes, between the lowest- and highest-income families. In the study of income inequality, studies typically examine average income within a quintile and the income gaps, or differences, between these quintiles.

The income gap between the top and bottom quintiles started at \$83,800 in 1980, fluctuated between \$79,500 and \$84,500 till 1996, then grew over \$20,000 to \$105,400 in 2005. By 2005, average after-tax income was \$128,200 for the highest quintile and \$22,800 for the lowest.

The percentage increase in the after-tax income gap over the 1980 to 2005 period was slightly lower for unattached individuals, at 21%, than it was for families, at 26%.

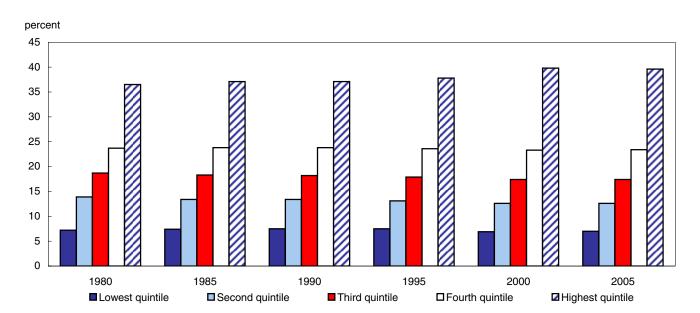

Chart 6
Share of after-tax income for families by after-tax income quintiles, Canada, 1980 to 2005

Though all quintiles benefited from the positive economic conditions that prevailed since the early 1990s, families in the top quintile gained the most. Between 1996 and 2005, the top quintile saw a 24% increase in their average after-tax income, while the other quintiles saw 18% increases, apart from the third quintile, which saw a 17% increase.

Unattached individuals also experienced gains in their after-tax income between 1996 and 2005. Generally, these were not as large as they were for families. While unattached individuals in the third quintile and the highest quintile enjoyed fairly substantial increases, 19% and 24%, respectively, those in the first, second and fourth quintiles realised more modest gains, at 9.5%, 12% and 16% over the period.

#### Tax-transfer system continues to reduce income inequality

Government transfers and federal-provincial-territorial income tax systems help redistribute income from higher income Canadians to lower income Canadians – hence reducing income inequality.

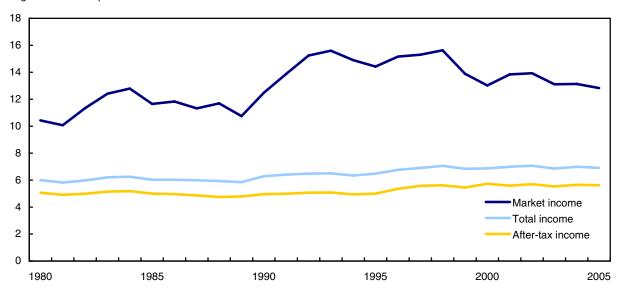

The ratio of average income earned by the top quintile to the average income earned by the bottom is another measure of income inequality.

In 2005, the average market income for families in the highest quintile was 12.8 times higher than those in the lowest quintile. However, once all government transfers are distributed, this ratio fell to 6.9 times higher. After taxes the average market income for families in the highest quintile was 5.6 times higher than their counterparts in the lowest. This clearly demonstrates how the government transfers and tax system decrease the inequality between the highest and the lowest income families.

This measure also shows growth in income inequality between 1980 and 2005. In 1980 the average after-tax income for families in the highest quintile was 5.1 times higher than those in the lowest quintile. This ratio rose to about 5.6 times higher in 1997, and remained at or close to that level up to 2005.

Chart 7
Ratio of average income of the highest quintile families to the lowest, Canada, 1980 to 2005

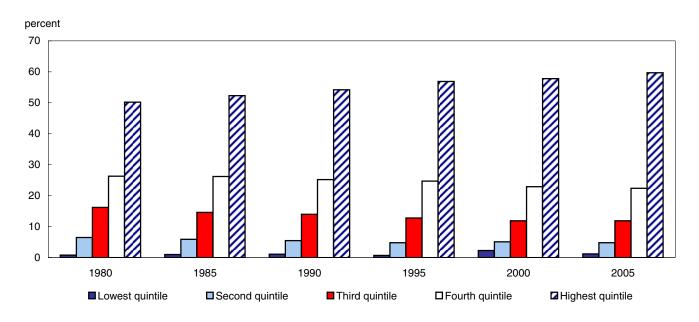

Average income ratio: Highest to lowest quintile

Highest 20% of income recipients pay almost 60% of personal income taxes

The 20% of Canadian families and unattached who took home the largest amount of after-tax income in 2005 collectively paid almost 60% of all personal income taxes that year, up from 50% in 1980. This change in tax share reflects, in part, increases in their share of total after-tax income and the redistributive nature of Canada's personal income tax systems.

Chart 8
Share of income tax by after-tax income quintiles, families and unattached individuals, Canada, 1980 to 2005

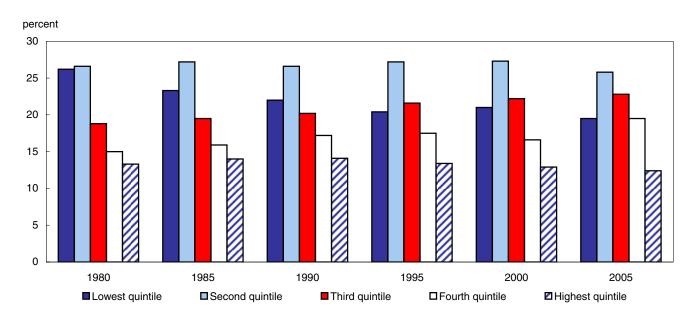

Chart 9 Share of government transfers by after-tax income quintiles, families and unattached individuals, Canada, 1980 to 2005

During the 25-year period from 1980 to 2005, the income tax share paid by the middle 60% of income recipients fell steadily from about 49% of the total to just under 40%, while their share of government transfers rose from 60% to 68%. The higher share of government transfers received by the middle quintile reflects in part their larger family size, number of children and number of seniors in these families. By contrast, the lowest quintile received a lower share of government transfers in part because they disproportionately reflect the young working age group.

The implicit tax rate - the share of total income paid in income taxes - rose for the top two quintiles between 1980 and 1990, remained relatively stable till 2000, and fell afterwards. All quintiles experienced a fall in their implicit tax rate after 2000, in part due to federal income tax cuts introduced in 2001. Budgets and budget updates in 2000 reduced all marginal income tax rates, reintroduced full-inflation indexation of income tax thresholds, and enriched tax credits to various groups including students and people with disabilities.

#### Low income rate for families remained unchanged in 2005

In 2005, an estimated 655,000 Canadian families were below the low-income cut-off (LICO) after taxes, representing 7.4% of all families, a proportion unchanged from 2004. The families in low income faced an average gap of \$7,900, which represents the amount of income they required to bring their income above the cut-off.

Statistics Canada's low-income rate measures the percentage of families below the low-income cutoff (LICO). The LICO is a statistical measure of the income threshold below which Canadians likely devote a larger share of income than average to the necessities of food, shelter and clothing.

#### Low income varies across family types

Among non-senior families the incidence of low income was virtually unchanged at 8.4% in 2005. Senior families saw their low income rate remained relatively stable at around 2%.

Married couples with two earners experienced the lowest incidence of low income, at 3.0%, while two-parent families with children and no earners experienced the highest incidence, at 83.9%.

Of the 2 million families and unattached individuals in low-income, more than half were unattached individuals. In 2005, 30.4% of unattached individuals experienced low income. The low income rate was higher for the non-senior singles at 34.3%.

Chart 10 Incidence of low income among different family types, Canada, 2005

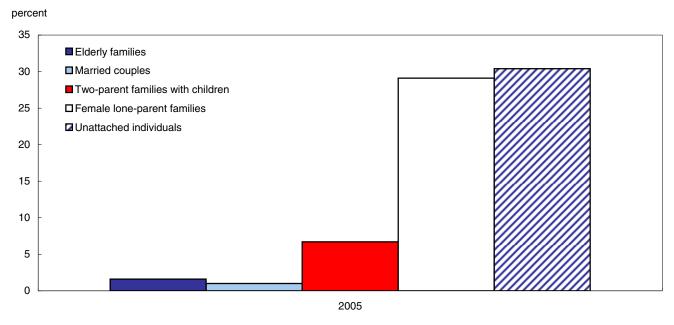

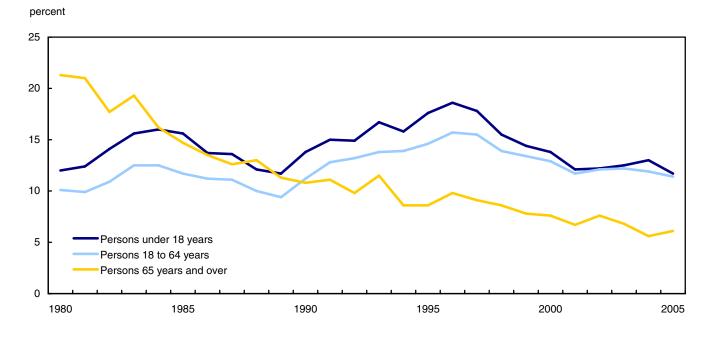

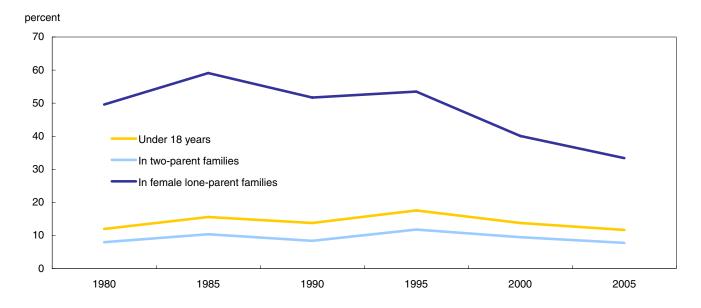

Chart 11 Incidence of low income among individuals, Canada, 1980 to 2005

#### Low-income rate for single mother families declines

Female lone-parent families saw a decrease in their low income rate, which fell from 36.0% in 2004 to 29.1% in 2005. This reflects an upward trend in market income in recent years driven by higher earnings and a larger proportion of earners. Although this decrease continued a four-year downward trend, the incidence of low income for female lone-parent families remained more than four times as high as that of two-parent family with children.

Chart 12 Incidence of low income among children, Canada, 1980 to 2005

#### Little change in the proportion of Canadians in low income

After climbing throughout the early 1990s, the prevalence of low income among all Canadians peaked at 15.7% in 1996, declined to 11.2% in 2001 and remained at or close to that level till 2005. In 2005, about 3.4 million people, or 10.8% of the population, were in low.

#### Children in low income

About 788,000 children under 18 years of age lived in low-income families in 2005, down from 1.3 million in 1996. The proportion of children in low-income families fell from its peak of 18.6% in 1996 to its current level of about 11.7%.

In 2005, 320,000 children, just under half of all the children in low-income families, lived in female lone parent families. The low-income rate of children in female lone-parent families was more than four time higher than that of two-parent families. However the low-income rate for these children fell from 40.4% in 2004, to 33.4% in 2005.

#### Low-income rate for working age persons

In 2005, 11.4% of people aged 18 to 64 lived in low-income. About half of this group consisted of unattached individuals. About 6.9% of persons aged 18 to 64 living in families experienced low income while 34.3% of unattached individuals experienced low income.

#### Seniors in low income

In 2005, 6.1% of seniors lived below Statistics Canada's low income cut-off. The low-income rate among seniors remained stable in 2005 following a downward trend which began in the early 1980s.

Seniors living alone experienced a rate 15 times higher than seniors living in families: 18.4% compared to 1.2%.

#### Technical note - the "Gini" coefficient

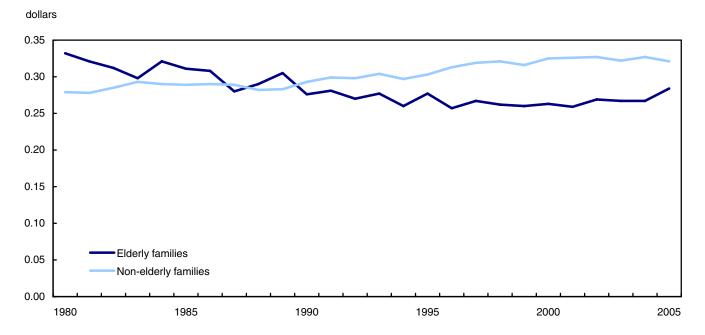

The 'Gini coefficient' provides an alternative way to measure income inequality. It is particularly useful in examining inequality trends over a longer period of time.

The Gini coefficient is a number between zero and one. The number zero represents perfect income equality, where everyone receives the same income. The number one represents perfect inequality, where one person receives all income and others receive nothing. The higher the value of the Gini coefficient, the higher the degree of income inequality in a society.

Using after-tax income for families, the Gini coefficient rose during the 1990s to about 0.33 in 2000, after fluctuating slightly between the 0.29 and 0.30 marks throughout the 1980s. The coefficient has remained at about 0.33 since 2000.

We see different trends among senior families and non-senior families when we examine Gini coefficients based on after-tax income. In 1980, seniors saw a higher level of income inequality, at 0.33, than did non-seniors, at 0.28. This inequality fell over time among seniors, but rose among younger families. Currently, senior families experience less income inequality, at 0.28, than do non-senior families, at 0.32.

Other government transfers	·	,	,	,	,	,	,	,	·	· ·		

<sup>1.</sup> Source: Income Statistics Division, Statistics Canada.

<sup>2.</sup> Includes economic families of two persons or more and unattached individuals.

<sup>3.</sup> Starting in 1999, all social assistance amounts reported to the survey by one or both individuals in a couple are reassigned to the female spouse, or the older of the two spouses in the case of a same-sex couple. This caused a shift in some of the time series for social assistance data for individuals, for example, an increase in the average amount received, and a decrease in the number of recipients. The time series showing the aggregate amount of social assistance is not affected, nor are the data at the family or household level.

<sup>4.</sup> Includes economic families and unattached individuals. An economic family is defined as a group of two or more persons who live in the same dwelling and are related to each other by blood, marriage, common law or adoption. An unattached individual is a person living either alone or with others to whom he or she is unrelated, such as roommates or a lodger.

# **Notes and definitions**

#### Income

This section reviews the definitions of the main income concepts and their components. In order to highlight the relationships between them, this section is organized according to the "Classification of income" (see text box — Classification of income by source).

## Classification of income by source

#### Market income

Earnings

Wages, salaries and commission

Self-employment income

Farm

Non-farm

Investment income

Retirement pensions

Other income

#### (plus) Government transfers

Child tax benefits

Old Age Security and Guaranteed Income Supplement/Spouse's Allowance

Canada Pension Plan/Quebec Pension Plan benefits

**Employment Insurance benefits** 

Social assistance

Workers' compensation

**GST/HST Credit** 

Provincial/territorial tax credits

Other government transfers

(equals) Total Income

(minus) Income tax

(equals) After-tax Income

#### The concept of income

There are several important inclusions and exclusions in the concept of income:

- The concept of income covers income received while a resident of Canada or as relevant for income tax purposes in Canada. This excludes some, but not all, foreign income.
- Retirement income received as a regular pension or annuity during retirement is included, while cash withdrawals from private pension plans, including Registered Retirement Savings Plans (RRSPs), prior to retirement, are excluded.
- Realized capital gains from financial investments are excluded.
- · In the Canadian System of National Accounts (CSNA) and the present income classification, taxes on capital gains are included in income taxes, as are taxes on RRSP withdrawals. Both capital gains (the taxable portion thereof) and RRSP withdrawals figure in the calculation of taxes, but are not part of total income in the CSNA or in SLID's Classification of income.

- SLID's classification of income includes all refundable tax credits and benefits, including those that are not considered for income tax purposes, such as child tax benefits, the Goods and Services Tax Credit/Harmonized Sales Tax Credit, and other provincial or territorial tax credits. There are other smaller differences between SLID's total income and total income defined for tax purposes (see Other income and Other government transfers ).
- · Contributions to Employment Insurance and the Canada and Quebec Pension Plans, both federal programs, are not included in income taxes, nor are they deducted from income to arrive at after-tax income. However, the CSNA recently revised its definition of taxes on production to include these payroll taxes, in accordance with international recommendations on national accounting.

#### Market income

Market income is the sum of earnings (from employment and net self-employment), net investment income, (private) retirement income, and the items under "Other income". It is equivalent to total income minus government transfers. It is also called income before taxes and transfers.

#### **Earnings**

This includes earnings from both paid employment (wages and salaries) and self-employment.

## Wages, salaries and commissions

These are gross earnings from all jobs held as an employee, before payroll deductions such as income taxes, employment insurance contributions or pension plan contributions, etc. Wages and salaries include the earnings of owners of incorporated businesses, although some amounts may instead be reported as investment income. Commission income received by salespersons as well as occasional earnings for baby-sitting, for delivering papers, for cleaning, etc. are included. Overtime pay is included.

Military personnel living in barracks are not part of the target population in SLID.

## Self-employment income

This is net self-employment income after deduction of expenses. Negative amounts (losses) are accepted. It includes income received from self-employment, in partnership in an unincorporated business, or in independent professional practice. Income from roomers and boarders (excluding that received from relatives) is included. Note that because of the various inclusions, receipt of self-employment income does not necessarily mean the person held a job.

Self-employment income is subdivided into farm self-employment income and non-farm self-employment income. Farm self-employment income is reported by individuals who operate their own or a rented farm, either on own account or in partnership. Included are money receipts from the sale of farm products as well as related supplementary and assistance payments from governments. Income in kind is excluded.

#### Investment income

This includes interest received on bonds, deposits and savings certificates from Canadian or foreign sources, dividends received from Canadian and foreign corporate stocks, cash dividends received from insurance policies, net rental income from real estate and farms, interest received on loans and mortgages, regular income from an estate or trust fund and other investment income. Realized capital gains from the sale of assets are excluded. Negative amounts are accepted.

#### **Retirement pensions**

This is retirement pensions from all private sources, primarily employer pension plans. Amounts may be received in various forms such as annuities, superannuation or RRIFs (Registered Retirement Income Funds). Withdrawals from RRSPs (Registered Retirement Savings Plans) are not included in retirement pensions. However, they are taken into account as necessary for the estimation of certain government transfers and taxes. For data obtained from administrative records, income withdrawn from RRSPs before the age of 65 is treated as RRSP withdrawals, and income withdrawn from RRSPs at ages 65 or older is treated as retirement pensions. Retirement pensions may also be called pension income.

#### Other income

This sub-total includes all items of market income not included elsewhere. Among them are support payments received (also called alimony and child support). The coverage of other items depends at least to some extent on the method of income data collection, whether from administrative income tax records or by interview. Those items which are included on line 130 of the T1 tax return are well covered. These include, but are not restricted to, retirement allowances (severance pay/termination benefits), scholarships, lump-sum payments from pensions and deferred profit-sharing plans received when leaving a plan, the taxable amount of death benefits other than those from CPP or QPP, and supplementary unemployment benefits not included in wages and salaries.

#### **Government transfers**

Government transfers include all direct payments from federal, provincial and municipal governments to individuals or families. See the table Classification of income for a list of the government transfers identified separately in the latest reference year. It should be noted that many features of the tax system also carry out social policy functions but are not government transfers per se. The tax system uses deductions and non-refundable tax credits, for example, to reduce the amount of tax payable, without providing a direct income.

#### Child tax benefits

Federal child tax benefits began in 1993 and replaced both the federal Family Allowances and the Child Tax Credit. Several provincial and territorial programs have since been introduced, in addition to Quebec family allowances which already existed before 1993. To be eligible, a person must have the primary responsibility for the care and upbringing of one or more children under the age of 18. Most benefits are calculated by setting a maximum amount per family or per child and reducing that total by a certain percentage of the family's net income.

The programs which were explicitly accounted for in the data were the federal basic benefit and National Child Benefit Supplement (together called the Canada Child Tax Benefit, began in 1998), the Newfoundland and Labrador Child Benefit (began in 1999), the Nova Scotia Child Benefit (began in 1998), the New Brunswick Child Tax Benefit (began in 1997), the New Brunswick Working Income Supplement (began in 1997), the Quebec Allocation familiale (began in 1981), the Quebec Allocation à la naissance (began in 1998), the Ontario Child Care Supplement for Working Families (began in 1998), the Saskatchewan Child Benefit (began in 1998), the Alberta Family Employment Tax Credit (began in 1997), the BC Family Bonus (began in 1996), and the BC Earned Income Benefit (began in 1998).

## **Old Age Security (OAS)**

The Old Age Security (OAS) pension is targeted to Canadian residents aged 65 and over. OAS recipients who have little or no other income may also receive the federal Guaranteed Income Supplement (GIS) and their spouses, if aged 60 to 64 (and not yet eligible for OAS and GIS themselves), receive the Spouse's Allowance.

## Canada Pension Plan (CPP) and Quebec Pension Plan (QPP)

The CPP and QPP are compulsory contributory social insurance programs that provide a source of retirement income and protect workers and their families against loss of income due to disability or death.

#### **Employment Insurance**

Employment Insurance is a federal program which includes the following types of benefits: regular unemployment benefits, sickness benefits, maternity and parental benefits, and benefits for persons taking approved training courses or participating in job creation or job-sharing projects. To qualify, the claimant must have ceased receiving employment income and have worked a minimum number of weeks or hours of insurable employment over the preceding period.

#### Social assistance

Social assistance covers many provincial and municipal income supplements to individuals and families. It is usually provided only after all other possible sources of support have been exhausted.

## Workers' compensation

Workers' compensation is provided to protect all full-time and part-time employees from loss of salary due to work accidents or occupational diseases and help them to pay their medical expenses and other costs.

#### Goods and Services Tax/Harmonized Sales Tax credit

Introduced in conjunction with the Goods and Services Tax in 1990, it is intended to offset the GST/HST for lower income families and individuals. In Nova Scotia, New Brunswick, and Newfoundland and Labrador it is called the Harmonized Sales Tax Credit because the administration of the tax is combined with the provincial sales tax. Included is the federal Relief Heating Expenses paid in 2001.

#### Provincial/territorial tax credits

Included here are refundable tax credits other than those for children (included with child tax benefits). Some are designed to help low income individuals and families to pay property taxes, education taxes, rent and living expenses, and so on. Provincial sales tax credits such as the Quebec Sales Tax Credit and the Newfoundland and Labrador HST Credit are included. The Quebec abatement, although refundable, is not included here but rather with income taxes. These credits are given to the family member with the highest net income.

#### Other government transfers

This includes government transfers not included elsewhere, mainly any other non-taxable transfers. In SLID, these amounts are included with "Other income". This is partly because the coverage of any transfers not taxed through the income tax system is low. There may be under-reporting of these transfers, which are mainly collected using an open question in SLID interviews. Nonetheless, the types of transfers which have come under this heading include: training program payments not reported elsewhere, the Veteran's pension, pensions to the blind and the disabled, regular payments from provincial automobile insurance plans (excluding lump-sum payments), and benefits for fishing industry employees.

#### **Total income**

Total income refers to income from all sources including government transfers before deduction of federal and provincial income taxes. It may also be called income before tax (but after transfers). All sources of income are identified as belonging to either market income or government transfers.

#### Income tax

Income tax is the sum of federal and provincial income taxes payable (accrued) for the taxation year. Income taxes include taxes on income, capital gains and RRSP withdrawals, after taking into account exemptions, deductions, non-refundable tax credits, and the refundable Quebec abatement. The data are either taken directly from administrative records or estimated based on aggregate data from administrative records, as this yields better results than the amounts reported by interview.

#### After-tax income

After-tax income is total income, which includes government transfers, less income tax. It may also be called income after tax. Some of the government transfers listed above are not taxable and are allocated to only one family member, depending on age, income, or gender. These include social assistance, child tax benefits, and seniors benefit. When looking at person-level data, users should be aware that these transfers are not equally divided amongst family members.

# **Family**

# **Dwelling**

In general terms a dwelling is defined as a set of living quarters. A private dwelling is a separate set of living quarters with a private access. A collective dwelling may be institutional, communal or commercial in nature. Of the different types of collective dwellings, SLID covers only communal dwellings.

#### Household

A household is defined as a person or group of persons residing in a dwelling. SLID defines households and families according to the living arrangements on December 31 of the reference year. Residents of Canada are also defined at those points in time.

#### **Adults**

Adults are defined in SLID as individuals 16 or older as of December 31st of the reference year.

#### Family income

Family income is the sum of income of each adult in the family as defined above. Household income is likewise the sum of incomes of all adults in the household. Family and household membership is defined at a particular point in time, while income is based on the entire calendar year. The family members or "composition" may have changed during the reference year, but no adjustment is made to family income to reflect this change.

#### **Economic family type**

"Economic family type" refers to either economic families or unattached individuals. An economic family is defined as a group of two or more persons who live in the same dwelling and are related to each other by blood, marriage, common law or adoption. An unattached individual is a person living either alone or with others to whom he or she is unrelated, such as roommates or a lodger. See Family classification for more detailed groupings.

#### Census family type

"Census family type" refers to either census families or persons not in census families. The term "census family" corresponds to what is commonly referred to as a "nuclear family" or "immediate family". In general, it consists of a married couple or common-law couple with or without children, or a lone-parent with a child or children. Furthermore, each child does not have his or her own spouse or child living in the household. A "child" of a parent in a census family must be under the age of 25 and there must be a parent-child relationship (guardian relationships such as aunt or uncle are not sufficient).

Persons "not in census families" are those living alone, living with unrelated individuals, or living with relatives but not in a husband-wife or parent-unmarried child (including guardianship-child) relationship.

By definition, all persons who are members of a census family are also members of the same economic family.

See Family classification for more detailed groupings.

#### Major income earner

This characteristic is important for the derivation of detailed family types (see Family classification). For each household and family, the major income earner is the person with the highest income before tax, with one exception: a child living in the same census family as his/her parent(s) cannot be identified as the major income earner of the census family (this does not apply to economic families).

For persons with negative total income before tax, the absolute value of their income is used, to reflect the fact that negative incomes generally arise from losses "earned" in the market-place which are not meant to be sustained. In the rare situations where two persons have exactly the same income, the older person is the major income earner.

#### Family classification

SLID uses the major income earner to classify families.

#### Table B. Classification of family types

# Economic families (or Census families), 2 persons or more

Elderly families

Married couples

Other elderly families

Non-elderly families

Married couples without children

No earner

One earner

Two earners

Two-parent families with children

No earner

One earner

Two earners

Three or more earners

Married couples with other relatives

Lone-parent families

Male Ione-parent families

Female lone-parent families

No earner

One earner

Two or more earners

Other non-elderly families

# Unattached individuals (or Persons not in census families)

Elderly male

Non-earner

Earner

Elderly female

Non-earner

Earner

Non-elderly male

Non-earner

Earner

Non-elderly female

Non-earner

Earner

## **Elderly family**

The major income earner is aged 65 or over.

Seniors are denoted as the 'elderly' in our tables.

## Non-elderly family

The major income earner is under age 65.

#### Married couples/spouses

Married couples, including legally married, common-law and same-sex relationships, where one of the spouses is the major income earner.

#### Singles

Singles are denoted as 'unattached individuals'.

#### Children

A child or children (by birth, adopted, step, or foster) of the major income earner under age 18. Other relatives may also be in the family.

## Lone-parent family

Includes at least one child as defined above. Families where the parent is 65 years or older are excluded.

#### Relative

A person related to the major income earner by blood, marriage, adoption or common-law.

#### Other relative

A person in the economic family who is not the major income earner nor his/her spouse or child under age 18.

# **Analytical concepts**

#### Current dollars versus constant dollars

"Current dollars" are what we usually mean when we refer to a currency in the current time period. The term "constant dollars" refers to dollars of several years expressed in terms of their value ("purchasing power") in a single year, called the base year. This type of adjustment is done to eliminate the impact of widespread price changes.

Current dollars are converted to constant dollars using an index of price movements. The most widely used index for household or family incomes, provided that no specific uses of the income are identified, is the Consumer Price Index (CPI), which reflects average spending patterns by consumers in Canada.

The following table shows the annual rates of the Consumer Price Index. To convert current dollars of any year to constant dollars, divide them by the index of that year and multiply them by the index of the base year you choose (remember that the numerator contains the index value of the year you want to move to). For example, using this index, \$10,000 in 1997 would be \$10,548 in 2000 constant dollars (\$10,000 x 113.5/107.6 = \$10,548).

Text table 1 Consumer price index, annual rates, 1992=100

Year	1982	1983	1984	1985	1986	1987	1988	1989	1990	1991	1992	1993	1994	1995
Annual rates	65.3	69.1	72.1	75.0	78.1	81.5	84.8	89.0	93.3	98.5	100.0	101.8	102.0	104.2
	1996	1	997	1998	1999	)	2000	2001	2002	2	2003	2004	2005	2006
	105.9	1	07.6	108.6	110.5	5 1	13.5	116.4	119.0	)	122.3	124.6	127.3	129.9

#### Earner/Income recipient

An earner is a person who received income from employment (wages and salaries) and/or self-employment during the reference year. The term income recipient is generally used for someone who received a positive (or negative) amount of income of any given type.

#### Mean income (average income)

The mean or average income is computed as the total or "aggregate" income divided by the number of units in the population. It offers a convenient way of tracking aggregate income while adjusting for changes in the size of the population.

There are two drawbacks to using average income for analysis. First, since everyone's income is counted, the mean is sensitive to extreme values: unusually high income values will have a large impact on the estimate of the mean income, while unusually low ones, i.e. highly negative values, will drive it down. (See also Recipients versus non-recipients and Negative values.) Secondly, it does not give any insight into the allocation of income across members of the population. To examine allocation of income, measures such as Percentiles or Gini coefficients may be used.

#### Recipients versus non-recipients (zero values)

For every table showing average incomes, it must be kept in mind whether non-recipients of that type of income are included or excluded from the population. In the case of total family income, the difference from including or excluding units with zero income is small since there are very few such families. However, if one is interested in the average amount of individual self-employment earnings, the value will be quite different if one includes those persons who were not self-employed.

#### **Negative values**

Negative income amounts can arise in two ways: net losses from self-employment (expenses exceed receipts), or net investment losses (losses exceed gains). As with zero values, negative values can have a large impact on results. In general, the published income tables treat negative values no differently than positive values, but there are a few exceptions: for the calculation of both Gini coefficients and the low income gap, negative values are converted to zeroes; and in the derivation of the major income earner of a family or household, the absolute value is used instead (see Major income earner).

#### **Percentiles**

Income percentiles, like quintiles and deciles, are a convenient way of categorizing units of a given population from lowest income to highest income for the purposes of drawing conclusions about the relative situation of people at either end or in the middle of the scale. Rather than using fixed income ranges, as in a typical distribution of income, it is the fraction of each population group that is fixed.

First, all the units of the population, whether individuals or families, are ranked from lowest to highest by the value of their income of a specified type, such as after-tax income. Then the ranked population is divided into five groups of equal numbers of units, called quintiles. Analogously, dividing the population ranked by income into ten groups, each comprising the same number of units, produces deciles.

Most analyses should be carried out on the people of different percentiles within one population distribution. Care should be taken in making comparisons between percentiles that resulted from different distributions, because any difference in either the population or the income concept used to rank units could have a large effect. It is probable that both the income ranges represented by each percentile and the people making up each percentile will be different.

#### **Median income**

The median income is the value for which half of the units in the population have lower incomes and half has higher incomes. To derive the median value of income, units are ranked from lowest to highest according to their income

and then separated into two equal-sized groups. The value that separates these groups is the median income (50th percentile).

Because the median corresponds exactly to the midpoint of the income distribution, it is not, contrary to the mean, affected by extreme income values. This is a useful feature of the median, as it allows one to abstract from unusually high values held by relatively few people.

Since income distributions are typically skewed to the left – that is, concentrated at the low end of the income scale – median income is usually lower than mean income.

## Implicit rate of government transfers or taxes

The implicit rate of government transfers or taxes is a way of showing the relative importance of transfers received or taxes paid for different families or individuals. This concept is similar, but not identical, to the effective rate of taxation. For a given individual or family, the effective rate is the amount of transfers/taxes expressed as a percentage of their market income, total income, or after-tax income. The implicit rate for a given population is the average (or aggregate) amount of transfers/taxes expressed as a percentage of their average (or aggregate) income.

### Family size adjustment (equivalence scale)

When comparing family incomes to study such things as income adequacy or socio-economic status, one often wants to take family size and composition into account—the income amount itself is not sufficient to understand a family's financial well-being without knowing how many people are sharing it. In general, two approaches have been used to help with the analysis of family income. One is to produce data by detailed family types, so that within a given family type, differences in family size are not significant. In fact, many income measures have been crossed by detailed family types in the published tables. The other way to take into account family size and composition is to adjust the income amount by an adjustment factor.

The simplest method is to use per capita income, that is, to divide the family income by the family size. A limitation of per capita income, however, is that it tends to underestimate economic well-being for larger families as compared to smaller families. This is due to the fact that it assumes equal living costs for each member of the family, but some costs, primarily those related to shelter, decrease proportionately with family size (they may also be lower for children than for adults). For example, the shelter costs for an adult married couple with no children are arguably not much more than those for an adult living alone.

To take such economies of scale into account, it is common to use an "equivalence scale" to adjust family incomes. Instead of implicitly assuming equal costs for additional family members as the per capita approach does, the equivalence scale is a set of decreasing factors assigned to the first member, the second member, and so on. The adjusted income amount for the family is obtained by dividing the family's income by the sum of the factors assigned to each member.

There is no single equivalence scale in use in Canada. The one used in the published income tables and in concepts such as the low income measure (LIM) has, however, achieved a high degree of acceptance. In this equivalence scale, the factors are as follows:

- the oldest person in the family receives a factor of 1.0;
- the second oldest person in the family receives a factor of 0.4;
- all other family members aged 16 and over each receive a factor of 0.4; and
- all other family members under age 16 receive a factor of 0.3.

Other equivalence scales in use include:

Organisation for Economic Co-operation and Development (OECD) scale

- the oldest person in the family receives a factor of 1.0;
- all other family members aged 15 and over each receive a factor of 0.5;
- all other family members under age 15 receive a factor of 0.3.

Square root of family size (this is a close approximation to the LIM equivalence scale, particularly for families with 6 members or less).

#### Gini coefficient

The Gini coefficient measures the degree of inequality in the income distribution. Gini coefficients are published for market income, total income and after-tax income, and are used to compare the uniformity of income allocation between different income concepts, across different populations or within the same population over time.

Values of the Gini coefficient can range from 0 to 1. A value of zero indicates income is equally divided among the population with all units receiving exactly the same amount of income. At the opposite extreme, a Gini coefficient of 1 denotes a perfectly unequal distribution where one unit possesses all of the income in the economy. A decrease in the value of the Gini coefficient can, by and large, be interpreted as reflecting a decrease in inequality, and vice versa. As a rough rule of thumb when using data from SLID at the Canada level: an absolute difference of 0.01 or less between two Gini coefficients is considered statistically significant.

#### Low income definitions

#### Low Income Cut-offs (LICOs)?

Low income cut-offs (LICOs) are established using data from the Family Expenditure Survey, now known as the Survey of Household Spending. They convey the income level at which a family may be in straitened circumstances because it has to spend a greater proportion of its income on necessities than the average family of similar size. Specifically, the threshold is defined as the income below which a family is likely to spend 20 percentage points more of its income on food, shelter and clothing than the average family. There are separate cut-offs for seven sizes of family – from unattached individuals to families of seven or more persons – and for five community sizes – from rural areas to urban areas with a population of more than 500,000.

The first step in the production of a set of low income cut-offs is to calculate the average proportion of income that a family spends on food, shelter and clothing. The 1992 Family Expenditure Survey found that, on average, families spend 44% of their after-tax income (and 35% of their total "before-tax" income) on these necessities. Then, 20 percentage points are added, giving 64% of after-tax income. This is done on the grounds that a family spending more than this proportion of its income on necessities is significantly worse off than the average family. The final step is to look at the distribution of income by expenditure and determine, using a regression line, the level of income at which a family tends to spend 20 percentage points more than the average on the necessities of food, shelter and clothing.

## Rebasing and indexing the LICOs

Over time, Canadian families have spent a smaller percentage of their income on the necessities of food, shelter and clothing. This relationship between families' income and spending is associated with a specific point in time, i.e. the year of the expenditure survey used to derive the cut-offs. That particular year is referred to as the base year for the set of cut-offs.

After having calculated LICOs in the base year, cut-offs for other years are obtained by applying the corresponding Consumer Price Index (CPI) inflation rate to the cut-offs from the base year – the process of indexing the LICOs.

#### Low income rate and low income gap

To determine whether a person (or family) is in low income, the appropriate LICO (given the family size and community size) is compared to the income of the person's economic family. If the economic family income is below the cut-off, all individuals in that family are considered to be in low income. In other words, "persons in low income" should be interpreted as persons who are part of low income families, including persons living alone whose income is below the cut-off. Similarly, "children in low income" means children who are living in low income families. Overall, the low income rate for persons can then be calculated as the number of persons in low income divided by the total population. The same can be done for families and various sub-groups of the population; for example, low income rates by age, sex, province or family types.

The low income gap is the amount that the family income falls short of the relevant low income cut-off. For example, a family with an income of \$15,000 and a low income cut-off of \$20,000 would have a low income gap of \$5,000. In percentage terms this gap would be 25%. The average gap for a given population, whether expressed in dollar or percentage terms, is the average of these values as calculated for each unit. For the calculation of this low income gap, negative incomes are treated as zero.

#### Use of after-tax and before-tax LICOs

Statistics Canada produces two sets of low income cut-offs and their corresponding rates—those based on total income (i.e., income including government transfers, before the deduction of income taxes) and those based on after-tax income. Derivation of before-tax versus after-tax low income cut-offs are each done independently. There is no simple relationship, such as the average amount of taxes payable, to distinguish the two types of cut-offs.

Although both sets of low income cut-offs continue to be available. Statistics Canada prefers the use of the after-tax LICOs. The before-tax rates only partly reflect the entire redistributive impact of Canada's tax/transfer system. It is therefore logical that the low income rate is higher on a before-tax basis than on an after-tax basis.

#### Low Income Measures (LIM)

For the purpose of making international comparisons, the LIM is the most commonly used low income measure. Unlike the low income cut-offs, which are derived from an expenditure survey and then compared to an income survey, the LIMs are both derived and applied using a single income survey. The LIM is a fixed percentage (50%) of median adjusted family income, where "adjusted" indicates that family needs are taken into account. See the paragraph Family size adjustment (equivalence scale) for more information.

The LIMs are calculated three times; using market income, before-tax income, and after-tax income. They do not require updating using an inflation index because they are calculated using an annual survey of family income.

#### Market basket measure (MBM)

Social Development Canada (formerly Human Resources Development Canada) has collaborated with the provincial and territorial ministries of social services to develop the Market Basket Measure (MBM) of low income. The approach is to cost out a basket of necessary goods and services including food, shelter, clothing and transportation, and a multiplier to cover other essentials. The results define thresholds that represent levels of income needed to cover the cost of the basket.

The same argument that can be made for using after-tax low income rates can be made for using after-tax income to compare to the MBM thresholds. That is, a measure of well-being should take into account what is actually available to spend. The income concept that is used for comparisons with the MBM thresholds goes even further than after-tax income by also subtracting from total income other non-discretionary expenses such as support payments, work-related child care costs and employee contributions to pension plans and to Employment Insurance.

Statistics Canada collects the data necessary to produce rates based on Social Development Canada's Market Basket Measure.

# Comparisons between data up to 1995 and data since 1996

Starting with reference year 1996, the Survey of Labour and Income Dynamics (SLID) replaced the annual Survey of Consumer Finances (SCF) as the official source of family income in Canada. This means that data up to and including 1995 are drawn from SCF (last conducted for reference year 1997), and data for 1996 and onwards are drawn from the SLID (which was introduced in 1993).

Different surveys will produce slightly different estimates on the same topics due to a variety of factors. Every attempt was made to minimize and monitor these differences between the two income surveys, while nonetheless making some important improvements in survey practices. Before replacing the SCF series with SLID, a careful study was done on the overlapping reference years, particularly the years 1996 and 1997, as SLID only acquired its full sample size in 1996. The results of the study are contained in the Income Statistics Division research paper, A Comparison of the Results of the Survey of Labour and Income Dynamics (SLID) and the Survey of Consumer Finances (SCF) 1993-1997: Update (75F002M). All ISD research papers are available free of charge on the Statistics Canada internet site (www.statcan.ca).

In short, it was found that the two surveys told essentially the same story for all of the main income concepts. It is still possible, nonetheless, that for some characteristics the data trends could reveal a "break" as a result of the change in survey. Such a break would likely appear as a noticeable upward or downward shift in a data series between the years 1995 and 1996. It represents a change in the data which is attributable to the two surveys having different samples and different methods (such as the use of tax data in the case of SLID), rather than a true change in the characteristics of the population. Users are advised to take note of the following survey differences which are known to exist and to have had an impact on the data trends at some detailed levels.

## Better coverage of small income amounts

One notable improvement that occurred as a result of new survey techniques introduced in SLID is better coverage of small income amounts received by respondents. It has been observed in surveys conducted by questionnaire that respondents tend to forget or neglect small income amounts they received in the past. This means an underestimation of income in general, and in particular, it means that many people who received a small amount of income instead report no income at all (there are differences, however, depending on whether the income concept includes or excludes government transfers).

The use of administrative income tax files in SLID for the majority of sample respondents means that there is considerably better coverage of non-zero amounts of income, and in general, a greater number of recipients of most kinds of income. Another technique used by SLID which may have improved coverage is that, even for respondents who report income by interview instead of via their tax records, there are two chances to prompt them for income sources, and therefore a greater likelihood of capturing an amount. This is because some income concepts are touched on in the January interview and then covered in the May interview, where it is possible to remind the respondent of a positive response in January. The types of income for which such "dependent interviewing" is used are earnings (from employment or self-employment), employment insurance benefits, social assistance, and workers' compensation.

# **Detailed family types**

The standard published "detailed family types" for economic families have changed in one regard. In the SCF, they are derived with reference to the "head of family". In SLID, the same categories are used but in reference to the "major income earner". SLID dropped the concept of head of family entirely, as it has little relevance in a modern context. But some sort of prioritization of people within a family is useful to uniquely identify the type of family, even if it is somewhat arbitrary.

The change in family concepts resulting from the transition from SCF to SLID has not affected data produced for the entire population of families consisting of two or more persons. However, for some of the detailed family types, the estimated number of families underwent a one-time increase or decrease between 1995 and 1996. Without drawing conclusions about the precise net effects of these changes, the following points can be made.

First, whereas the previous definition always gave husbands the status of head of family rather than wives, with the major income earner concept there is no distinction by sex, and it is possible for the wife to qualify. Since it still holds that wives are on average younger than husbands at least for older couples, this has caused a shift from elderly families to non-elderly families.

Second, the head of family concept gave preference to parents over their adult children and, where there is no husband-wife or parent-child relationship in the family, it gave preference to older members over younger ones. Now, younger adults are much more likely to qualify as major income earners than they did as heads of families. As a result, we see significant decreases in the number of "other elderly families" and "married couples with other relatives", and a large increase in the number of "other non-elderly families". (See the section "Family definitions" for the precise definitions of family types.)

# Comparisons with previous editions

Data from different editions are not directly comparable. Every edition has some modifications done on data. The modification which is applied every year is the expression of all dollars amounts in constant dollars of the latest reference year. (See "Current dollars versus constant dollars".)

Periodically, the weights are updated to reflect the availability of new population benchmarks provided by a new census. The most recent multi-year weight revision for the Survey of Labour and Income Dynamics and the Survey of Consumer Finance occurred with the release of data for 2003, when the population projections based on the 2001 Census of Population were incorporated.

The improvements to survey weights during the 2000 and 2003 historical revisions were part of a comprehensive project at Statistics Canada regarding the weighting strategies in the main annual surveys on income, expenditures, and wealth. Weights are typically adjusted using population benchmarks by province, age and sex. Since the 2000 weight revision, the weights in SLID and SCF also respect population benchmarks by household size and economic family size.

Since the 2003 revision, the weights from 1990 to the current period include adjustments based on the annual T4 file from Canada Revenue Agency (CRA), which is a compilation of employer remittances for the purposes of payroll taxes. For more information, please refer to the free research paper, *Survey of Labour and Income Dynamics:* 2003 historical revision, Statistics Canada, (link 75F0002M)

The 2003 historical revision was followed up with a minor weight revision for 2003 only, timed with the release of data for 2004.

# **Methodology**

# Survey universe

SLID is a household survey that covers all individuals in Canada, excluding residents of the Yukon, the Northwest Territories and Nunavut, residents of institutions and persons living on Indian reserves or in military barracks. Overall, these exclusions amount to less than three percent of the population.

# The sample

The samples for SLID are selected from the monthly Labour Force Survey (LFS) and thus share the latter's sample design. The LFS sample is drawn from an area frame and is based on a stratified, multi-stage design that uses probability sampling. The total sample is composed of six independent samples, called rotation groups, because each month one sixth of the sample (or one rotation group) is replaced.

The SLID sample is composed of two panels. Each panel consists of two LFS rotation groups and includes roughly 17,000 households. A panel is surveyed for a period of six consecutive years. A new panel is introduced every three years, so two panels always overlap.

# Weighting

The estimation of population characteristics from a survey is based on the premise that each sampled unit represents, in addition to itself, a certain number of unsampled units in the population. A basic survey weight is attached to each record to indicate the number of units in the population that are represented by that unit in the sample.

For each reference year, SLID produces two sets of weights: one is representative of the initial population (the longitudinal weights) while the other is representative of the current population (the cross-sectional weights). For the production of the cross-sectional weights, SLID combines two independent samples and assigns a probability of selection to individuals who joined the sample after the panel was selected.

Two types of adjustment are applied to the basic survey weights in order to improve the reliability of the estimates. The basic weights are first inflated to compensate for non-response. The non-response adjusted weights are then further adjusted to ensure that estimates on relevant population characteristics would respect population totals from sources other than the survey.

The first set of population totals used for SLID is based on Statistics Canada's Demography Division population counts for different age/sex groups as well as counts by household and family size at the provincial level. These annual population totals are based in large part on totals from the Census of population.

The second set of totals is derived from Canada Revenue Agency (CRA) administrative data (T4 file) and is intended to ensure that the weighted distribution of income (based on wages and salaries) in the data set matches that of the Canadian population.

# **Cross-sectional representation in SLID**

Each longitudinal sample, or "panel" in SLID initially constitutes a representative cross-sectional sample of the population. However, because the real population changes each year, whereas by design the longitudinal sample does not, the sample must be modified to properly reflect these changes to the composition of the population. This is

done by adding to the sample all new people in the population who are found to be living with the initial respondents (and likewise dropping them from the sample if they leave at later time-points).

Any original respondents who leave the target population (by moving abroad, into institutions, etc.) are given a zero weight for cross-sectional purposes. In this way, the cross-sectional sample, composed of the original respondents minus those who left the target population plus those who have entered it, is virtually fully representative of the population at each subsequent time-point. The missing group is composed of persons who have newly entered the target population and are not living with anyone who was in the target population when the most recent panel was selected. However, since SLID introduces a new panel every three years, this group is quite small.

# **Data quality**

There are two types of errors inherent in sample survey data, namely, non-sampling errors and sampling errors. The reliability of survey estimates depends on the combined impact of non-sampling and sampling errors. For more detailed information on data quality indicators see the research paper (Data quality in the 2004 Survey of Labour and Income Dynamics (SLID) 75F0002M) available free of charge on the Statistics Canada internet site (www.statcan.ca).

# Non-sampling errors

Non-sampling errors generally result from human errors such as simple mistakes, misunderstanding or misinterpretation. The impact of randomly occurring errors over a large number of observations will be minimal. Errors occurring systematically can, on the other hand, have a major impact on the reliability of estimates. Considerable time and effort is invested into reducing non-sampling errors in SLID.

Non-sampling errors may arise from a variety of sources such as coverage, response, non-response and processing errors.

**Coverage error** arises when sampling frame units do not exactly represent the target population. Units may have been omitted from the sampling frame (under-coverage), or units not in the target population may have been included (overcoverage), or units may have been included more than once (duplicates). Undercoverage represents the most common coverage problem.

**Slippage** is a measure of survey coverage error. It is defined as the percentage difference between control totals (Census population projections) and weighted sample counts. Slippage rates for household surveys are generally positive because some people that should be enumerated are missed. Slippage rates have been revised back to 1996 using the 2001 Census population projections. According to the numbers in the table below, in 2004, SLID covered 85.7% of its target population. SLID estimation procedures use Census population projections to compensate for determined slippage.

Rates are also available upon request for sex, province and age groupings.

Text table 1 Slippage rates in SLID

	1997	1998	1999	2000	2001	2002	2003	2004	2005					
	percentage													
Canada	8.4	9.0	8.4	9.5	10.6	12.4	13.4	14.2	14.5					

Response errors may be due to many factors, such as faulty questionnaire design, interviewers' or respondents' misinterpretation of questions, or respondents' faulty reporting. Great effort is invested in SLID to reduce the occurrence of response error. Measures undertaken to minimize response errors include the use of highly-skilled and well-trained interviewers, and supervision of interviewers to detect misinterpretation of instructions or problems

with the questionnaire design. Response error can also be brought about by respondents who, willingly or not, provide inaccurate responses.

Income data are especially prone to misreporting, as income is a sensitive issue and includes many items with which respondents are not always familiar. Therefore, respondents are provided with information by mail prior to the interview, informing them of the income related questions. This gives them time to consult documents and have information available at the time of the interview. For respondents who grant Statistics Canada permission to access their tax files (the majority of respondents), SLID collects income data directly from administrative files. This procedure reduces misreporting of income in the SLID.

**Non-response errors** occur in sample surveys because not all potential respondents cooperate fully. The extent of non-response varies from partial non-response to total non-response.

**Total non-response** occurs when the interviewer is unable to contact the respondent, no member of the household is able to provide information, or the respondent refuses to participate in the survey.

Response is calculated at the household level. A household is considered to be "respondent" if at least one of its members responds to either the January or the May interview. There is the additional stipulation that the information on the household's composition cannot be missing for more than one year.

Total household non-response is handled by adjusting the basic survey weight for individuals within responding households to compensate for individuals in nonresponding households.

Nonresponding members (if any) within responding households who did not respond to one or both of the collection phases will have final data that is either shown as "missing" on the final database or imputed, depending on the variable (see partial non response section for details on imputation).

The importance of the non-response error is unknown but in general this error is significant when a group of people with particular characteristics in common refuse to cooperate and where those characteristics are important determinants of survey results. The bias introduced by non-response increases with the differences between respondent and non-respondent characteristics. Methods employed to compensate for non-response make use of information available for both respondents and non-respondents in an attempt to minimize this bias.

High response rates are essential for the data quality of any survey and thus considerable effort is invested to encourage effective participation from SLID respondents.

Cross-sectional households' response rates, given in Table, range between 74.7% (2004) and 86.0% (1996)."

Text table 2
Response rate in SCF (1990-1995) and SLID (1996-2005)

	1990	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004	2005
	percent															
Response Rate	79.0	80.0	80.7	80.0	79.5	82.1	86.0	84.1	82.7	82.7	79.2	79.1	79.0	78.3	74.7	76.1

**Partial non response** occurs when the respondent does not understand or misinterprets a question, refuses to answer a question, or is unable to recall the requested information. Imputing missing values compensates for this partial non-response.

Income data are imputed using previous years' data updated for any changes in circumstances. In the absence of previous years' data, data is imputed using the "nearest neighbour" technique, in which a respondent with certain similar characteristics becomes the "donor" for the imputed value.

Amounts received through certain government programs, such as child tax benefits, the Goods and Services Harmonized Sales Tax Credit, and the Guaranteed Income Supplement, are also derived from other information. Data obtained from the tax route are complete and do not need imputation.

**Processing errors** can occur at various stages in the survey: data capture, editing, coding, weighting or tabulation. The computer-assisted collection method used for SLID reduces the chance of introducing capture errors because checks for consistency and completeness of the data are built into the computer application. To minimize coding, weighting or tabulation errors, diagnostic tests are carried out periodically. These tests include comparisons of results with other data sources.

# Sampling errors

Sampling errors occur because inferences about the entire population are based on information obtained from only a sample of the population. The results are usually different from those that would be obtained if information were collected from the whole population. Errors due to the extension of conclusions based on the sample to the entire population are known as sampling errors. The sample design, the variability of the population characteristics measured by the survey, and the sample size determine the magnitude of the sampling error. In addition, for a given sample design, different methods of estimation will result in sampling errors of different sizes.

## Standard error and coefficient of variation

A common measure of sampling error is the standard error (SE). The standard error measures the degree of variation introduced in estimates by selecting one particular sample rather than another of the same size and design. The standard error may also be used to calculate confidence intervals associated with an estimate (Y). Confidence intervals are used to express the precision of the estimate. It has been demonstrated mathematically that, if the sampling were repeated many times, the true population value would lie within the confidence interval Y  $\pm$  2SE 95 times out of 100 and within the narrower confidence interval defined by Y  $\pm$  SE, 68 times out of 100. Another important measure of sampling error is given by the coefficient of variation, which is computed as the estimated standard error as a percentage of the estimate Y (i.e., 100 x SE / Y).

To illustrate the relationship between the standard error, the confidence intervals and the coefficient of variation, let us take the following example. Suppose that the estimated average income from a given source is \$10,000, and that its corresponding standard error is \$200. The coefficient of variation is therefore equal to 2%. The 95% confidence interval estimated from this sample ranges from \$9,600 to \$10,400, i.e. \$10,000  $\pm$  \$400. Thus it is assumed with a 95% degree of confidence that the average income of the target population is between \$9,600 and \$10,400.

The bootstrap approach is used for the calculation of the standard errors of the estimates. For more information on standard errors and coefficients of variation, refer to the Statistics Canada publication, (Methodology of the Canadian Labour Force Survey) available on the Statistics Canada internet site (www.statcan.ca).

# Suppression rules

Suppression rules, or data reliability cutoffs, are currently established based on the sample size that underlies the estimate. In general, a sample size of 25 observations is required for the estimate to be published. Depending on the type of estimate, this rule can vary slightly. These rules help protect the confidentiality of survey respondents and ensure the reliability of estimates.

Text table 3

#### Suppression rules for various estimates

## Estimate Supress IF:

## Percentage, distribution, proportion/shares

• % under the low-income cutoff (LICO) Denominator\* sample size < 25

Income distribution or

• Proportion of families with income=0 Denominator\* sample size < 100 and numerator sample size < 5

#### **Ratios**

Numerator sample size < 25

• female/male earnings or

Denominator sample size < 25

## Quintiles (shares, means and upper income limits)

• shares of income by quintile sample size of all quintiles/5 < 25

average income by quintile or

• upper income limits upper income limit for upper income quintile or total of quintiles

#### Other estimates

Counts

• Mean

• Medians sample size < 25

· Gini coeficients

# **Quality Indicators**

Quality indicators (QIs) are based on the estimate's coefficient of variation (CV) and suppression rules. At present, quality indicators are applied mostly to the 2003 estimates with the exception of a few longitudinal tables. For years where the quality indicators are not available, they are omitted. The following symbols are used:

Text table 4

<sup>\*</sup>The denominator sample size refers to the sample size of the total estimate from which the distribution, percentage, proportion or share is derived.

# **Quality rules**

## **Estimates for:** QI Code **Description** Most current year Excellent (CV between 0 and 2%) Α В Very good (CV between 2% and 4%) С Good (CV between 4% and 8%) D Acceptable (CV between 8% and 16%) Ε Use with caution (CV greater than or equal to 16%) All years F Too unreliable to be published Not available for a complete reference period Not available for a specific reference period Not applicable Preliminary р r Revised Suppressed to meet the confidentiality requirements of the Statistics Act Х

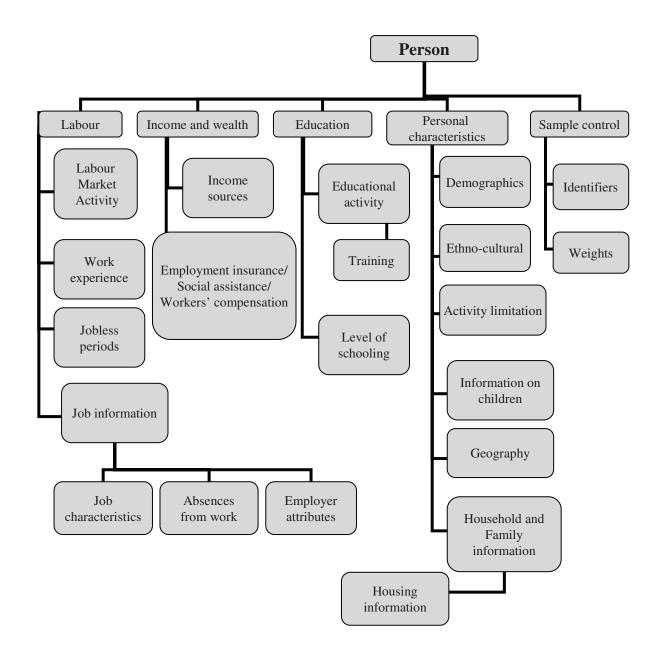

# **Survey content**

SLID collects data on a wide range of topics. Some are inherently "dynamic", involving transitions and spells, while others have important explanatory value.

The content themes are shown in Figure:

- Labour
- · Income and wealth
- Education
- · Personal characteristics
- Sample control

For more detailed information on survey variables, refer to the SLID electronic data dictionary.

# Labour

# Labour market activity

- major activity during year
- employment/unemployment spells (start and end dates, durations)
- · weekly labour force status
- total weeks of employment, unemployment and inactivity by year

- · multiple job-holding spells
- · work absence spells

## Work experience

- · years of full-time and part-time employment
- · years of experience in full-time, full-year equivalents

## **Jobless periods**

- · job search during spell
- · dates of search spells
- · desire for employment
- · reason for not looking

#### Job characteristics\*

- · start and end dates, first date ever worked for this employer
- wages
- · work schedule (hours and type)
- benefits
- · union membership
- occupation
- · supervisory and managerial responsibilities
- class of worker
- tenure
- · how job was obtained
- · reason for job separation

## Absences from work\*

- · absence dates
- reason
- · paid or unpaid

<sup>\*</sup>Job characteristics are updated annually for up to six jobs per year with dates of change recorded.

<sup>\*</sup>Absences lasting one or more weeks are collected on the first and last absence each year, for each employer.

## **Employer attributes**

- · industry
- · firm size
- · public or private sector

# **Income and Wealth**

#### Income source

- · annual information on about 25 income sources
- market income
- · government transfers
- · taxes paid
- · after-tax income

## Receipt of Employment Insurance/social assistance/workers compensation\*

- · Employment Insurance
- · social assistance
- · workers' compensation

# **Education**

## **Educational activity**

- · enrolled in a credit program, months, weeks and hours attended
- type of institution
- · full-time or part-time student
- · certificates received (if applicable)
- · job-related training courses, seminars, workshops and conferences

## Level of schooling/educational attainment\*

- · years of schooling
- · degrees and diplomas
- · major field of study

<sup>\*</sup>Amount and timing of monthly benefits received from each source.

<sup>\*</sup>Updated annually

## **Personal characteristics**

# **Demographics**

- · year of birth/age
- sex
- · duration of current marital status
- year/age at first marriage

#### **Ethno-cultural**

- · ethnic background
- · member of an employment equity designated group
- · mother tongue
- · date of immigration
- · country of birth
- · parents' schooling and place of birth

## **Activity limitation**

- annual information on activity limitations and their impact on working
- · satisfaction with work

#### Information on children

- · number of children born, raised
- · year and person's age when first child born

# Geography and geographic mobility

- · economic region or census metropolitan area of current residence
- · size of community
- moved during year
- move dates
- reason for move
- · nature of move (full household/household split)

# Household and family information\*

- key characteristics of other household/family members (e.g., age, sex, relationship, income, annual hours worked)
- · relevant low-income cutoff

- family events (marriage, separation, deaths, births)
- · Housing information:
- · type of dwelling
- · dwelling condition
- · characteristics of dwelling
- ownership / mortgage / rent
- · payments / costs / rent inclusions
- · housing suitability indicator
- · Shelter costs to income ratio

# **Sample control**

## **Identifiers**

- person
- · household
- · economic family
- · census family

# Weights

- · cross-sectional
- · cross-sectional adjusted for labour non-response
- longitudinal

<sup>\*</sup>Annual summary information, e.g., size, type
