## Note of appreciation

Canada owes the success of its statistical system to a long standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

## User information

## Symbols

The following standard symbols are used in Statistics Canada publications:
. not available for any reference period
.. not available for a specific reference period
... not applicable
0 true zero or a value rounded to zero
0 s value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
p preliminary
r revised
x suppressed to meet the confidentiality requirements of the Statistics Act
E use with caution
F too unreliable to be published

## Notice to readers

Most of the components used to produce preliminary population estimates are estimated using demographic models or based on data sources less complete or reliable, albeit more timely, than those used for updated or final estimates.

## Charts

1. Quarterly variation of population estimates, Canada, provinces and territories, January to March, 2006 and 2007
2. Alberta net interprovincial migration by juridiction, January to March, 2006 and 200710
3. Quarterly aggregated demographic components, January to March, 1973 to 2007, Canada 11

## Highlights

- On April 1, 2007, Canada's population was estimated at $32,852,800$, an increase of 75,500 compared to January 1, 2007. The rate of population growth observed in the first quarter of $2007(0.23 \%)$ is similar to the same period in 2006.
- Net international migration remains high. The decrease in immigration observed in the last three months compared to the first quarter of 2006 is offset by a marked increase in the number of non-permanent residents.
- The distribution of immigration across Canada is becoming more uniform. In the last quarter, the number of immigrants either held steady or increased in all jurisdictions except Ontario, Alberta and British Columbia. Proportionally, Manitoba received the most new immigrants (annualized rate of 7.8 per thousand).
- Whereas natural increase was up in Alberta and British Columbia, it was increasingly negative in the Atlantic provinces. During the first quarter of 2007, all four Atlantic provinces for the first time simultaneously registered negative natural increase.
- The population of Alberta continued to grow more rapidly than the rest of Canada, but its growth rate slowed somewhat. This downward trend, which began in the last quarter of 2006, extended to the first three months of 2007.
- Canada's western provinces all experienced population growth equal to or greater than that of Canada as a whole. Manitoba's quarterly population growth was greater than Canada's for the second time since 1986.

## Analysis

On April 1, 2007, Canada's population was estimated at $32,852,800$, an increase of 75,500 compared to January 1, 2007. The rate of population growth observed in the first quarter of 2007 ( $0.23 \%$ ) is similar to the same period in 2006.

## Natural increase was stable for Canada as a whole...

The natural increase observed in the last three months $(+20,700)$ was down compared to the fourth quarter of $2006(+24,800)$. However, this is not surprising, because owing to seasonal variations in births and deaths, Canada's natural increase is usually at its lowest level during the first three months of the year.

The excess of the number of births over the number of deaths has been fairly stable in Canada during the past five years. The increase in births observed since 2003 has been offset by a rise in the number of deaths, which is to be expected in the context of an aging population.

## ... but was increasingly negative in the Atlantic provinces

Natural increase is not distributed evenly throughout Canada. While it is rising in Alberta and British Columbia, it is increasingly negative in the Atlantic provinces. During the first quarter of 2007, the four Atlantic provinces for the first time simultaneously posted negative natural increase. If the trends of recent history continue, this situation will occur regularly in the coming years.

## Chart 1

Quarterly variation of population estimates, Canada, provinces and territories, January to March, 2006 and 2007

## Immigration is better distributed

In the first three months of 2007, Canada received 47,900 immigrants. This was the first time since 2003 that Canada received fewer than 50,000 newcomers during a first quarter.

While Ontario continues to receive the most immigrants, its attractiveness for them is continuing to decline. In the last quarter, Ontario received $46.7 \%$ of new immigrants. Not since 1984 ( $44.5 \%$ ) has such a low proportion been observed for a first quarter.

While Alberta and British Columbia also attracted fewer immigrants in the last quarter, the other jurisdictions received a similar or larger proportion of newcomers. Among them, Manitoba stands out with the highest immigration rate in Canada (an annualized rate of 7.8 per thousand). This is the first time that a province other than Alberta, British Columbia and Ontario can boast of having the highest immigration rate in Canada.

## Number of non-permanent residents up sharply

Despite this decrease in immigration in Canada as a whole, Canada's net international migration remained substantial, since the number of non-permanent residents increased significantly $(16,200)$ during the first three months of the year.

Not since $1990(17,700)$ has there been such an increase during a first quarter. This situation was observed in practically all jurisdictions. The increase was especially marked in British Columbia $(4,400)$ and Alberta $(3,900)$. For the latter province, this was, regardless of the quarter, a new high. Record increases for a first quarter were also observed in Prince Edward Island and Manitoba.

## Alberta's population growth remained strong but slowed in favour of other provinces

Alberta's population continues to grow rapidly. Increasing by $0.57 \%$ during the last quarter, it grew at a rate 2.5 times higher than for Canada as a whole. However, this growth was less vigorous than in the first quarter of 2006 (0.77\%). This was the second consecutive quarter in which Alberta's population growth rate slowed.

Nevertheless, Alberta's population growth remains strong; the growth rate measured in the first three months of the year is the third highest for a first quarter since the early 1980s.

The main reason for this slowdown lies in a decrease in net interprovincial migration- from $+15,600$ in the first quarter of 2006 to $+7,400$ in the last quarter. This decrease offset the growth observed in both natural increase and international migration.

Whereas the number of interprovincial entrants fell slightly during the last quarter, from 28,000 to 25,400 , the number of persons leaving the province rose from 12,400 to 18,000 . Such a number of out-migrants had never before been observed in a first quarter.

Chart 2
Alberta net interprovincial migration by juridiction, January to March, 2006 and 2007

For a second consecutive quarter, Alberta lost in its population exchanges with the neighbouring provinces, Saskatchewan and British Columbia, as well as with Nunavut. Also, without being negative, Alberta's net interprovincial migration in relation to the other jurisdictions generally declined.

With Alberta's attractiveness diminishing somewhat, most other jurisdictions posted interprovincial net migration figures similar to or greater than in the first quarter of 2006. The only exceptions were Quebec and Yukon. The strongest increases in net gains in interprovincial migration were recorded in New Brunswick, Manitoba and the Northwest Territories.

## Population growth stronger in Western Canada

Population growth in the last quarter was much stronger in the provinces west of Ontario. Apart from Alberta, the only provinces whose population grew at a rate equal to or greater than the rate for Canada as a whole were British Columbia ( $0.34 \%$ ), Manitoba ( $0.25 \%$ ) and Saskatchewan ( $0.23 \%$ ). Nunavut joins this group with a growth of $0.87 \%$.

Chart 3
Quarterly aggregated demographic components, January to March, 1973 to 2007, Canada

For British Columbia, this was the strongest first-quarter population growth since 1997 (0.42\%). The increase is primarily due to a rise in its net gains in interprovincial migration, which went from +700 to $+2,500$. Whereas the province's net gains in relation to Alberta increased, British Columbia's net interprovincial migration in relation to Canada's other jurisdictions declined. This was the highest net interprovincial migration since the first quarter of $1996(+3,600)$.

For only the second time since 1986, first-quarter population growth was greater for Manitoba than for Canada as a whole. This was Manitoba's strongest first-quarter population gain since $1983(+3,000)$.

There are several ways to explain this situation. First, the province reduced its interprovincial migratory losses. For the first time since the first quarter of 2004, Manitoba had a positive migratory balance with jurisdictions other than Alberta. In addition, registering historical peaks for the number of new immigrants and non-permanent residents, the province had its largest international net migration figure in several decades.

Saskatchewan's growth was similar to that of Canada, owing primarily to an increase in its net interprovincial migration. Whereas the province had net losses of $-2,900$ in the first quarter of 2006, it posted a net gain of $+1,000$ in the first three months of 2007. Not since $1976(+1,100)$ had it registered such a high net interprovincial migration figure for a first quarter.

For a second consecutive quarter, the province's net interprovincial migration was positive, a phenomenon not observed since 1984. Furthermore, Saskatchewan's interprovincial gains were not only in relation to Alberta, but also with the other parts of Canada. Indeed, for the first time since 1998, Saskatchewan's net interprovincial migration with jurisdictions other than Alberta was positive for a third consecutive quarter.

Because its birth rate is by far the highest in Canada, Nunavut has the country's strongest population growth, and it continues to be the only territory whose increase in population exceeds the national average.

## Less rapid population growth elsewhere in Canada

Provinces and territories whose population growth was positive but below the national average were Prince Edward Island ( $0.12 \%$ ), New Brunswick ( $0.04 \%$ ), Quebec ( $0.14 \%$ ), Ontario ( $0.22 \%$ ) and the Northwest Territories ( $0.04 \%$ ).

For the third consecutive quarter, Ontario posted population growth below the national average. Not since 1981 has the province had less rapid first-quarter population growth than the rest of Canada.

There are two explanations for this slowdown. First is the decrease in Ontario's net international migration, which has not been so low in a first quarter since 1999. Also, despite a decrease in its interprovincial migratory losses in relation to the first quarter of 2006, those losses are nevertheless among the largest since the early 1980s. Among persons leaving Ontario for another province, more than 40\% opted for Alberta.

Despite negative natural increase, the population of Prince Edward Island continued to grow. For that province, this was a fifth consecutive quarter with population growth. Last quarter's growth is due in particular to a marked increase in net international migration. During the first three months of 2007, Prince Edward Island registered record highs for the number of immigrants and of new non-permanent residents in a first quarter.

Unlike in the first quarter of 2006, the population of New Brunswick grew in the first three months of 2007. That increase was due to two factors. First, there was an increase in province's net international migration. Not since 1980 have so many immigrants arrived in a first quarter. Also, New Brunswick's net interprovincial migration was the highest since 2004 for a first quarter.

During the first three months of 2007, Quebec registered a slightly lower population increase than in the same period the previous year. An increase in the province's net international migration, due to slight rises in both the number of immigrants and the number of non-permanent residents, was not enough to offset the combined effect of a decrease in its natural increase and an increase in its losses in interprovincial migration.

Quebec's natural increase declined even though the number of births was up compared to the first quarter of last year. Also, net losses in interprovincial migration were aggravated by an increase in departures for Alberta.

Whereas it lost more than 300 persons in the first quarter of 2006, the Northwest Territories saw a resumption in population growth in the first three months of 2007. This turnaround is due to a decrease in the territory's interprovincial migratory losses compared to the first quarter of 2006.

## Three jurisdictions lost population

Three jurisdictions recorded population losses in the first quarter: Newfoundland and Labrador (-0.39\%), Nova Scotia (-0.09\%) and Yukon ( $-0.48 \%$ ).

Newfoundland and Labrador has seen it population decline steadily since the fourth quarter of 2003. Its interprovincial migratory losses ( $-1,900$ ), similar to in the first quarter of 2006, remained high. Also, immigration is low and the province's natural increase is increasingly negative.

Nova Scotia also saw its population decline during the last quarter. This was the third consecutive quarter in which the province's net population figure was down. A rise in losses due to increasingly negative natural increase offset the fact that the province received its highest number of new immigrants since the first quarter of 1998 and also had smaller losses in interprovincial migration. Nova Scotia's interprovincial migratory balance with jurisdictions other than Alberta was positive for a fourth consecutive quarter.

Yukon was the only territory to register a net decline in its population in the first quarter of the year. The population losses incurred by the territory are the highest since 1999 for a first quarter. This situation is due in particular to an increase in its net losses in interprovincial migration, which are the largest since 2000.

\section*{P Preliminary data}

Note(s): Preliminary estimates based on data from the Child Tax Benefit (CTB) Program and Fjk factors calculated using 2002-2003, 2003-2004 and 2004-2005 tax file data from Canada Revenue Agency.

\section*{Quality of estimates}

\section*{Post-2001 postcensal population estimates}

The postcensal estimates contain certain inaccuracies stemming from:
(a) errors in the 2001 Census data (the base population on which these estimates were constructed) and
(b) imperfections in other data sources and the method used to estimate the components.

\section*{Errors in census data}

Census data for total population by province or territory are affected by coverage errors. These errors occur when dwellings and/or individuals are missed, incorrectly included or counted more than once. Following each census, Statistics Canada undertakes coverage studies to measure these errors. The main study are the Reverse Record Check Survey (RRC) and the Census Overcoverage Study (COS). Based on these studies, estimates of net undercoverage (which is equal to the difference between undercoverage and overcoverage) are produced. Demography Division adjusts the population enumerated in the census by province and territory using these estimates.

\hline
\end{tabular}
1. The levels and rates are based on the Reverse Record Check (RRC) and the Overcoverage Study and include non-permanent residents.

The adjustment also incorporates the results of a study on the estimates of the number of people living on incompletely enumerated Indian reserves to complete the corrections for coverage errors in the census. The results of the coverage studies contain mainly sampling errors. For further information regarding the main coverage studies, please see the following document on Statistics Canada's web site: 2001 Census Technical Report on Coverage.

\section*{Errors coming from methodology and other data sources}

Errors due to estimation methodologies and data sources other than the census are can also be significant.

Since the law requires the recording of vital statistics, births and deaths data meet very high standards. Nevertheless, since preliminary estimates are derived, they can be slightly different from final estimates.

With respect to immigrants and non-permanent residents, Citizenship and Immigration Canada administers special data files on both of these components. Since immigration is controlled by law (the Immigration Act), data on immigrants and non-permanent residents are compiled upon arrival in Canada. These data represent only "legal" immigration and exclude illegal immigrants. Thus, for the "legal" part of international movement into Canada, the data are considered to be of high quality.

However, some biases such as the difference between the stated province of intended residence at the time of arrival and the actual province of residence, may persist. Finally, since information provided by the Visitor Data System from Citizenship and Immigration Canada is not complete (age and sex of dependents, province of residence for certain groups of permit holders), estimates of nonpermanent residents are more prone to error than data on immigrants.

Estimates of the number of emigrants and returning emigrants are both derived using Child Tax Benefit (CTB) data provided by Canada Revenue Agency (CRA). Data are adjusted to take into account the incomplete coverage of the CTB program and to derive the emigration and returning emigration of adults. These adjustments and the delay in obtaining the data are the two main sources of errors.

As current information on the number of persons living temporarily abroad does not exist, estimates are based on the Reverse Record Check (RRC) and the census. Estimates for the intercensal period, distributed equally among the five years, are maintained constant for the postcensal period. Provincial/territorial distributions are obtained from RRC. Moreover, assumptions were made to allow for the distribution of annual to a quarterly level. Any geographical or quarterly variation may introduce error in the estimation of these components.

While preliminary estimates of interprovincial migration are produced using data from the Child Tax Benefit (CTB) program, final estimates are calculated from the annual taxfile received from Canada Revenue Agency (CRA). Since the two estimates of interprovincial migration are produced from different sources of information, they are more subject to error.

\section*{Quality assessment}

In order to assess the quality of our estimates, two evaluation measures are used : precocity errors and errors of closure.

\section*{Precocity errors}

The quality of preliminary estimates of components is analysed using precocity errors. Precocity error, which is calculated on a quarterly basis, is defined as the difference between preliminary and final estimate of a particular component in terms of its relative proportion of the total population for the relevant geographical area. It can be calculated for both population and component estimates.

Precocity error allows for useful comparisons between components, as well as between provinces and territories or geographical areas of different population size. Note that when compared to the total population for an area, the differences between preliminary and final estimates of the components are quite small. There are, however, differences in the amount of impact on the population estimates between components and between provinces and territories.

Generally speaking, net interprovincial migration yields the greatest precocity errors. This is likely the result of the use of different data sources for preliminary and final estimates of interprovincial migration. In most years and for most provinces/territories, births, deaths and immigration estimates yielded the smallest precocity errors. For immigration estimates, this reflects the completeness of the data source and the availability of data for the more timely preliminary estimates. In the case of births and deaths, small precocity errors support the use of short-term projections for preliminary estimates.

According to the analysis of the most recent precocity errors and assuming that the quality of the basic data remains constant, the present postcensal estimates should have an acceptable degree of reliability.

\section*{Errors of closure}

The error of closure measures the exactness level of the final postcensal estimates. It can be defined as the difference between the enumerated population of the most recent census (after adjustments for net undercoverage) and the most current postcensal population estimates as of census day.

The error of closure comes from two sources: differences in the amount of net undercoverage and errors in the components of population change over the intercensal period. This can be calculated for population estimates and for age, sex and marital status. With each 5-year intercensal period, the error of closure can only be calculated with the release of census data and estimates of net undercoverage.

By dividing the error of closure by the adjusted census population rates are relatively small at the national level ( \(0.38 \%\) for 1996 and \(0.15 \%\) for 2001). At the provincial and territorial level, differences are understandably larger, since the estimates are also affected by errors in estimating interprovincial migration. Nevertheless, the provincial/territorial final postcensal estimates generally fall within \(1 \%\) of the adjusted census population.

Text table 3
Error of closure of the estimates of total population for Canada, provinces and territories, July 1,1996 and 2001
\begin{tabular}{|c|c|c|c|c|}
\hline \multirow[t]{2}{*}{} & \multicolumn{2}{|c|}{1996} & \multicolumn{2}{|c|}{2001} \\
\hline & Number & Rate
in
percent & Number & Rate
in
percent \\
\hline Canada & 113,416 & 0.38 & 46,467 & 0.15 \\
\hline Newfoundland and Labrador & 8,840 & 1.58 & 11,416 & 2.19 \\
\hline Prince Edward Island & 411 & 0.30 & 1,481 & 1.08 \\
\hline Nova Scotia & 6,446 & 0.69 & 9,034 & 0.97 \\
\hline New Brunswick & 5,634 & 0.75 & 4,638 & 0.62 \\
\hline Quebec & 96,449 & 1.33 & -320 & 0.00 \\
\hline Ontario & 56,479 & 0.51 & 8,857 & 0.07 \\
\hline Manitoba & -852 & -0.08 & -1,121 & -0.10 \\
\hline Saskatchewan & -7,400 & -0.73 & 15,952 & 1.59 \\
\hline Alberta & -8,124 & -0.29 & 714 & 0.02 \\
\hline British Columbia & -43,313 & -1.12 & -4,357 & -0.11 \\
\hline Yukon Territory & -244 & -0.78 & -354 & -1.18 \\
\hline Northwest Territories & -42 & -0.10 & 481 & 1.18 \\
\hline Nunavut & -868 & -3.39 & 46 & 0.16 \\
\hline
\end{tabular}

Note(s): The error of closure is equal to the July 1 postcensal estimate minus the census count adjusted to July 1 and for net census undercoverage. The percentage is: error of closure, divided by the census count adjusted to July 1 and for net census undercoverage, multiplied by 100.

\section*{Explanatory notes for the tables}

The numbers of interprovincial in-migrants are final up to June 2005 and preliminary from July 2005. from July 2005. July 2003 to March 2006 and preliminary from April 2006.
The numbers of net non-permanent residents are final up to June 2003, updated from July 2003 to March 2006 and preliminary from April 2006.

\section*{Appendix I}

\section*{Glossary}

\section*{Annualized rate}

Refers to the ratio of the estimated number of events converted to an annual basis divided by the average quarterly populations. In this respect, birth, death, immigration rates, etc are calculated. Generally, the rate is expressed in per 1,000.

\section*{Census coverage}

Net undercoverage: Difference between undercoverage and overcoverage.
Overcoverage: Number of persons who should not have been counted in the census or who were counted more than once.

Undercoverage: Number of persons who were intended to have been enumerated in a census but were not enumerated.

\section*{Components of demographic growth}

Any of the classes of events generating population movement variations. Births, deaths and migrations are the components responsible for the variation since they alter the total population.

\section*{Emigrants}

Canadian citizen or immigrant who has left Canada to establish a permanent residence in another country.

\section*{Error of closure}

Difference between the postcensal estimate for the same date as the census and the results of the census adjusted for net undercoverage.

\section*{Immigrant}

Within the framework of this publication, the term immigrant refers to landed immigrant. A landed immigrant is a person who does not have Canadian citizenship but was granted the right by immigration authorities to live in Canada on a permanent basis.

\section*{International migration}

International migration represents movement of population between Canada and a foreign country which involves a change in the usual place of residence. A distinction is made with regard to immigrants, emigrants, returning emigrants, net temporary emigrants and net non-permanent residents.

Interprovincial migration
Interprovincial migration represents movement from one province or territory involving a permanent change in residence. A person who takes up residence in another province or territory is an out-migrant with reference to the province or territory of origin and an in-migrant with reference to the province or territory of destination.

\section*{Natural increase}

Variation in population size over a given period as a result of the difference between the numbers of births and deaths.

\section*{Net international migration}

Net international migration is obtained according to the following formula: Immigrants + returning emigrants + net non permanent residents- (emigrants + net temporary emigrants)

\section*{Net interprovincial migration}

Net interprovincial migration represents the difference between in-migrants and out-migrants for a given province or territory.

\section*{Net non-permanent residents}

Net non-permanent residents represent the variation in the number of non-permanent residents between two dates.

\section*{Non-permanent residents}

A non permanent resident belongs to one of the five following groups:
- persons residing in Canada claiming refugee status;
- persons residing in Canada who hold a study permit;
- persons residing in Canada who hold a work permit;
- persons residing in Canada who hold a minister's permit;
- all non-Canadian born dependants of persons claiming refugee status, or of persons holding study permits, work permits or minister's permits and living in Canada.

\section*{Net temporary emigration}

Net temporary emigration represents the variation in the number of temporary emigrants between two dates. Temporary emigration includes Canadian citizens and immigrants living temporarily abroad who have not maintained a usual place of residence in Canada.

\section*{Population}

Estimated population and population according to the census are both defined as being the number of Canadians whose usual place of residence is in that area, regardless of where they happened to be on Census Day. Also included are any Canadians staying in a dwelling in that area on Census Day and having no usual place of residence elsewhere in Canada, as well as those considered non-permanent residents.

\section*{Population estimate}
(a) postcensal: Population estimate produced by using data from the most recent available census adjusted for net undercoverage and estimate of the components of demographic growth since that last census. This estimate can be preliminary, updated or final.
(b) intercensal: Population estimate derived by using postcensal estimates and data adjusted for net undercoverage of censuses preceding and following the year in question.

\section*{Population growth or total growth}

Variation of population size between two dates. It can also be obtained by summing the natural increase, total net migration and if possible, residual deviation. It can be positive or negative.

\section*{Residual deviation}

Difference between demographic population growth calculated using intercensal estimates of population between two dates and that obtained by the sum of the components for the same period. This deviation results from the distribution of the error of closure between years within the quinquennial period.

\section*{Returning emigrants}

Canadian citizen or immigrant having previously emigrated from Canada and subsequently returned to the country.

\section*{Total net migration}

Sum of net international and net interprovincial migration.

\section*{Vital events}

Includes all the demographic events (that is to say births, deaths, marriages and divorces) for which there exists a legal requirement to inform the Provincial or Territorial Registrar's Office.
