

HOUSING NOW

Barrie CMA

Canada Mortgage and Housing Corporation

Date Released: Second Quarter 2008

New Home Market

New Home Construction Growth Healthy

New home construction in the first quarter came in at 220, up 42.9 per cent from the same quarter last year. Relatively low mortgage rates, decreased new listings, and stable home prices all contributed to increased new housing starts in the Barrie Census Metropolitan Area (CMA).

Singles accounted for a majority of all new housing construction in the region, a result that mirrored the same quarter last year. Despite some increase in starts of other home types in 2007, which could be attributed to the high single home prices of 2007, this trend, seems to have reversed and returned to its historical tendency. Historically, Barrie CMA has always had a strong preference for singles over other home types.

A higher proportion of the region's housing starts are occurring in Barrie's "suburbs" (Innisfil Town and Springwater Township). Compared to first quarter last year where just over 32 per cent of total starts (or 50 starts) came from this area, first quarter results this year indicate that over 53 per cent of total starts (or 112 starts) were built there. Not surprisingly, almost all (apart from 5 rowhouse starts in first quarter 2008) starts were singles. With suitable land for singles development becoming less abundant in Barrie City, more residents are deciding to settle in the suburbs.

Compared to last year when the average price of a new single-detached home in the Barrie CMA grew by a strong 7 per cent to \$329,500, figures so far this year point to a very slight increase of 0.2 per cent to \$330,300. Similar to last year, prices outside of Barrie City continue to be on average more expensive.

Resale Market

Resale Market Slows

First quarter existing home sales in 2008 came in at 895 homes, a drop of over 13 per cent compared to the same quarter last year. Last year's first quarter sales set a record, and despite the decline, this year's sales were still above the first quarter average since 2000.

On a year-over-year basis, the number of new listings decreased six per cent during the previous quarter

to 2,004. Since the drop was not as strong as the decline in sales, the sales to new listings ratio¹ (SNLR) also declined. Like sales, listings remained well above the eight-year first quarter average since 2000.

Overall, the SNLR for the quarter dropped to about 45 per cent from around 48 per cent a year ago. Both indicate market conditions were balanced in these periods.

Several factors explain the decreased activity in the resale home market this quarter relative to similar previous quarters. The region was affected by a severe winter. Therefore, some sellers may have shied away from putting their home on the market and some buyers may have decided to put off shopping around for a home. The housing market is cyclical and some decline from the 2007 sales record was not unexpected. Finally, the rate of price increases has

slowed, implying some potential sellers may be less interested in putting their home on the market.

Local Economy

Employment

After growing at 1.7 per cent in 2007, employment has begun to dip. Manufacturing continues to be a strong provider of employment in the region even though employment in this sector has marginally decreased. The overall vitality of the manufacturing sector is due to growth in automobiles from Honda's sizeable investments which have helped to insulate it.

Other sectors have not been as healthy and instead have faced significant decreases in year over year employment. Industries such as trade and construction have been adversely hit by high energy prices, a high Canadian dollar, and weak US demand.

Figure 2

¹ The sale to new listings ratio (SNLR) is a proxy measure for the interplay between demand (sales) and supply (new listings) in the market. CMHC classifies markets as seller's, balanced or buyer's. A market with an SNLR above 55 per cent is classified as a seller's market while a market with an SNLR between 35 and 55 per cent is classified as a balanced market and a market with an SNLR below 35 per cent is considered a buyer's market. In a balanced market demand is relatively equal to supply, prices tend to grow at the rate of inflation, and homes are not sold as quickly as in a seller's market.

METHODOLOGY

Starts & Completions Survey Methodology

The Starts and Completions Survey is conducted by way of site visits which are used to confirm that new units have reached set stages in the construction process. Since most municipalities in the country issue building permits, these are used as an indication of where construction is likely to take place. In areas where there are no permits, reliance has to be placed either on local sources or searching procedures.

The Starts and Completions Survey is carried out monthly in urban areas with population in excess of 50,000, as defined by the 2006 Census. In urban areas with populations of 10,000 to 49,999, all Starts are enumerated in the last month of the quarter (i.e. four times a year, in March, June, September and December). In these centres with quarterly enumeration, Completion activity is modelled based on historical patterns. Monthly Starts and Completions activity in these quarterly locations are statistically estimated at a provincial level for single and multi categories. Centres with populations below 10,000 are enumerated on a sample basis, also in the last month of each quarter (i.e. four times a year, in March, June, September and December).

The Starts and Completions Survey enumerates dwelling units in new structures only, designed for non-transient and year-round occupancy.

Mobile homes are included in the surveys. A mobile home is a type of manufactured house that is completely assembled in a factory and then moved to a foundation before it is occupied.

Trailers or any other movable dwelling (the larger often referred to as a mobile home) with no permanent foundation are excluded from the survey.

Conversions and/or alterations within an existing structure are excluded from the surveys as are seasonal dwellings, such as: summer cottages, hunting and ski cabins, trailers and boat houses; and hostel accommodations, such as: hospitals, nursing homes, penal institutions, convents, monasteries, military and industrial camps, and collective types of accommodation such as: hotels, clubs, and lodging homes.

Market Absorption Survey Methodology

The Market Absorption Survey is carried out in conjunction with the Starts and Completions Survey in urban areas with populations in excess of 50,000. When a structure is recorded as completed, an update is also made as units are sold or rented. The dwellings are then enumerated each month until such time as full absorption occurs.

STARTS AND COMPLETIONS SURVEY AND MARKET ABSORPTION SURVEY DEFINITIONS

A “**dwelling unit**”, for purposes of the Starts and Completions Survey, is defined as a structurally separate set of self-contained living premises with a private entrance from outside the building or from a common hall, lobby, or stairway inside the building. Such an entrance must be one that can be used without passing through another separate dwelling unit.

A “**start**”, for purposes of the Starts and Completions Survey, is defined as the beginning of construction work on a building, usually when the concrete has been poured for the whole of the footing around the structure, or an equivalent stage where a basement will not be part of the structure.

The number of units “**under construction**” as at the end of the period shown, takes into account certain adjustments which are necessary for various reasons. For example, after a start on a dwelling has commenced construction may cease, or a structure, when completed, may contain more or fewer dwelling units than were reported at start.

A “**completion**”, for purposes of the Starts and Completions Survey, is defined as the stage at which all the proposed construction work on a dwelling unit has been performed, although under some circumstances a dwelling may be counted as completed where up to 10 per cent of the proposed work remains to be done.

The term “**absorbed**” means that a housing unit is no longer on the market (i.e. has been sold or rented). This usually happens when a binding contract is secured by a non-refundable deposit and has been signed by a qualified purchaser. The purpose of the Market Absorption Survey is to measure the rate at which units are sold or rented after they are completed, as well as collect prices.

DWELLING TYPES:

A **“Single-Detached”** dwelling (also referred to as **“Single”**) is a building containing only one dwelling unit, which is completely separated on all sides from any other dwelling or structure. Includes link homes, where two units may share a common basement wall but are separated above grade. Also includes cluster-single developments.

A **“Semi-Detached (Double)”** dwelling (also referred to as **“Semi”**) is one of two dwellings located side-by-side in a building, adjoining no other structure and separated by a common or party wall extending from ground to roof.

A **“Row (Townhouse)”** dwelling is a one family dwelling unit in a row of three or more attached dwellings separated by a common or party wall extending from ground to roof.

The term **“Apartment and other”** includes all dwellings other than those described above, including structures commonly known as stacked townhouses, duplexes, triplexes, double duplexes and row duplexes.

INTENDED MARKET:

The **“intended market”** is the tenure in which the unit is being marketed. This includes the following categories:

Freehold: A residence where the owner owns the dwelling and lot outright.

Condominium (including Strata-Titled): An individual dwelling which is privately owned, but where the building and/or the land are collectively owned by all dwelling unit owners. A condominium is a form of ownership rather than a type of house.

Rental: Dwelling constructed for rental purposes regardless of who finances the structure.

GEOGRAPHICAL TERMS:

A census metropolitan area (CMA) or a census agglomeration (CA) is formed by one or more adjacent municipalities centred on a large urban area (known as the urban core). The census population count of the urban core is at least 10,000 to form a census agglomeration and at least 100,000 to form a census metropolitan area. To be included in the CMA or CA, other adjacent municipalities must have a high degree of integration with the central urban area, as measured by commuting flows derived from census place of work data. CMAs and CAs contain whole municipalities or Census Subdivisions.

A **“Rural”** area, for the purposes of this publication, is a centre with a population less than 10,000.

All data presented in this publication is based on Statistics Canada’s 2001 Census area definitions.

CMHC—HOME TO CANADIANS

Canada Mortgage and Housing Corporation (CMHC) has been Canada's national housing agency for more than 60 years.

Together with other housing stakeholders, we help ensure that the Canadian housing system remains one of the best in the world. We are committed to helping Canadians access a wide choice of quality, environmentally sustainable and affordable homes – homes that will continue to create vibrant and healthy communities and cities across the country.
