Note of appreciation

Canada owes the success of its statistical system to a long standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

User information

Symbols

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0^s value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- p preliminary
- r revised
- x suppressed to meet the confidentiality requirements of the *Statistics Act*
- E use with caution
- F too unreliable to be published

Highlights

- Net value added for agriculture fell for the second consecutive year in 2006 to its lowest level since 1998, primarily due to declining farm inventories and lower program payments.

Chart 1
Distribution of net value added, Canada, 2006

Analysis

Net value added for agriculture fell for the second consecutive year in 2006 to its lowest level since 1998, primarily due to declining farm inventories and lower program payments.

Net value added dropped 17.6% to \$8.2 billion in 2006, well below the previous five-year average of \$10.1 billion which included a record \$11.4 billion in 2004. Newfoundland and Labrador, Prince Edward Island, New Brunswick and Manitoba were the only provinces to record gains.

Net value added measures agriculture's contribution to Canada's economy's production of goods and services created in a particular year. It is derived by the total value of agricultural sector production less the related annual cost of production (expenses on inputs, business taxes and depreciation) plus net direct government payments.

Net value added is distributed to the various factors of production, including rent to non-operator landlords, interest to lenders, wages and profits.

Total family wages were up 7.7% over 2005 to \$1.6 billion, whereas corporation profits and unincorporated operator returns were down 86.1% and 102.3% respectively. Interest charges were up 16.4% and accounted for 33% of net value added in 2006, while non-family wages accounted for 29%.

The value of agricultural production (the gross output of the agricultural sector) fell 4.9% in 2006 to \$44.5 billion, primarily due to a large decline in the value of inventory change along with a slight drop in sales of agricultural products and lower program payments. This level was 3.1% below the previous five-year average for the period between 2001 and 2005.

Overall sales of agricultural products edged down 1.2% to \$38.2 billion as lower sales to other farms offset an increase in sales to other sectors. This was 1.4% below the previous five-year average which was dragged down by back-to-back droughts in 2001 and 2002 as well as the closure of the US border to live cattle exports.

While sales of agricultural products to other farms declined 15.2% in 2006 to \$5.9 billion, sales to other sectors rose 1.9% to \$32.3 billion. The slight increase in sales to other sectors was due to higher revenues from crops which jumped 7.9% to \$14.5 billion as prices began to recover from their 2005 levels. Tempering the increase in sales to other sectors were weak hog prices which pushed livestock receipts down 2.5% in 2006.

After three consecutive years of increases, program payments fell to \$4.5 billion, 8.1% below the record level of 2005. Despite the drop, the 2006 level was 3.7% above the previous five-year average. Certain programs linked to cash flow problems and difficulties in the cattle sector were terminated in 2006, including the Farm Income Payment Program and BSE-related programs. Crop insurance payments also played a role, declining 21.1% as better growing conditions prevailed in 2006. However, new programs including the Grains and Oilseeds Payment Program and the Canadian Agricultural Income Stabilization (CAIS) Inventory Transition Initiatives helped to prevent a precipitous fall in payments.

The value of inventory change was -\$849 million in 2006, the first negative value since 2002, largely due to the conversion of on-farm stocks of canola and durum wheat into market deliveries, and lower stocks of feed grains.

Declining on-farm stocks of livestock were also a major contributor to the negative value of inventory change in 2006. Cattle inventories fell 3.6% in the wake of renewed live cattle exports to the United States, while hog inventories declined 1.3%.

Despite the large negative value of inventory change in 2006, on-farm stocks remained at very high levels as bountiful harvests in recent years had brought stocks up to record or near-record levels by the end of 2005.

As a result of the release of data from the 2006 Census of Agriculture on May 16, 2007, estimates of the agriculture value added account and other data contained in the Agriculture Economic Statistics series are being revised, where necessary. The complete set of revisions will be announced in a future release of the series in The Daily.

General information

This publication is part of a series of bulletins that also includes:

21-007-X	Farm product price index
21-010-X	Net farm income - Agriculture economic statistics
21-011-X	Farm cash receipts - Agriculture economic statistics
21-012-X	Farm operating expenses and depreciation charges - Agriculture economic statistics
21-013-X	Value of farm capital - Agriculture economic statistics
21-014-X	Farm debt outstanding - Agriculture economic statistics
21-015-X	Direct payments to agriculture producers - Agriculture economic statistics
21-016-X	Balance sheet of the agricultural sector - Agriculture economic statistics
21-018-X	Farm business cash flows - Agriculture economic statistics

All bulletins in this series can be obtained free on the internet at the Statistics Canada web site (www.statcan.ca). Notes on concepts and methods are also included in each bulletin.

This particular publication presents annual estimates of the agriculture value added account starting from 1981. Data highlights are provided for the most current year.

The electronic publication is first available in June. It includes preliminary estimates for the calendar year just ended. The following January, the publication is re-issued with revisions to the preliminary estimates. Revisions to the June issue can extend back two years, while those in January generally apply to three years. The date provided at the bottom of each table is the last time that a revision was made to that table.

All data appearing in this publication are available through the Canadian Socio-Economic Information Management System (CANSIM table 002-0004), Statistics Canada's corporate computerized data base network and information retrieval service.

Statistics Canada is committed to ensuring that there is no disclosure of confidential material and therefore all data are subjected to restrictions prior to release.

Value added account

Concepts

The value added account (or production account) has been designed to: record the value of economic production in the Canadian agricultural sector; distribute the income earned in this production to the factors of production; be based on the establishment concept; and display the information on a calendar year basis, by province.

Economic production can be defined as any process which creates value or adds value to existing goods. Consistent with this definition, the Canadian System of National Accounts defines economic production as the production of goods or services which are exchanged for money in the market economy.

Under the establishment concept, the standard unit of aggregation is the establishment. This is defined as the smallest operating entity which produces a homogeneous set of goods and services for which records provide data on value of output and cost of inputs.

The format of the value added account is designed to display sources and allocation of income (value of production). This account displays information at an aggregate level and does not display the detail which is available in the net farm income series.

The sources of income fall into four major categories: sales of agricultural products, sales of secondary production, other sources, and own-account production uses.

Sources of value of production

All **sales of agricultural products** are included in the value added account, including sales to other sectors and sales within the sector (farm to farm sales). Sales to farms outside the province of production are considered as sales to other sectors, as the objective is to produce provincial level accounts.

The use of the establishment concept implies that all **secondary production activities** of farm establishments should be included in the value added account. These might include farm woodlot production, sales of sand and gravel, or provision of recreational services. The income from all secondary production activities should be matched with associated expenses.

Other sources of income and the associated expenses are included to account for all income earned by farm establishments. The distinction between a nonagricultural sale and other income is not always clear. Federal and provincial government payments, received by farm establishments for participation in a variety of support and stabilization programs, are included because they are directly associated with farming activity. Income from the rental of farm land, received by the farming establishment, and custom work receipts are also included here.

Own-account production includes income-in-kind and the value of inventory change. Income-in-kind is the measure of the value of products produced on a farm which were consumed on the farm where the production occurred, instead of being sold. Production from farm gardens kept solely for own-consumption purposes is interpreted as operator household activity and is therefore excluded. The value of inventory change represents the economic value of the physical change in farm-owned inventories. Own-account production excludes the use of agricultural products, which are produced on the same establishment and used to produce other agricultural products for the market place.

The sum of these four sources of income results in the total value of production or the gross output of the agricultural sector.

Allocation of value of production

The allocation of that income falls into four major categories: expenses on inputs, business taxes, depreciation, and net value added.

Expenses on inputs include payments for goods and services which are used in the production of agricultural goods or services. These purchases may have been made from other sectors of the economy or other agricultural establishments. These intermediate inputs exclude, by definition, primary inputs such as labour and capital. Inter-farm sales, which are included as a source of income, are therefore offset by inter-farm purchases.

Business taxes are taxes paid in the course of production activities. These taxes consist of property taxes and taxes on purchased inputs. Since taxes on purchased inputs are included in expenses on inputs, business taxes consist of property taxes only.

Gross value added consists of payments to the factors of production and **depreciation** allowances (on an economic basis).

Net value added represents the value of economic production from agricultural establishments, and is expressed as gross value added minus **depreciation** allowances.

Distribution of net value added

Net value added is then distributed to the various factors of production, including rent to non-operator landlords, interest to lenders and wages to non-family members.

Profits and part of family wages are then allocated to incorporated agricultural businesses, while operator returns and the balance of family wages are allocated to unincorporated farms.

Methods and Data Quality

The method used to derive value added account estimates is based, whenever possible, on estimates which are used in the calculation of net income, including the farm cash receipts and farm operating expense series. Consequently, this outline is designed to be used with methodology reviews of the net income based data in the publication **Net farm income - Agriculture economic statistics**, Catalogue no. 21-010-X.

Data on sales of agricultural products to other farms and expenses on inputs from other farms are the sum of the following differences: total feed minus commercial feed; total seed minus commercial seed; and total livestock and poultry purchases minus interprovincial and international imports. Data related to total feed and seed expense are considered to be of good quality but the portions allocated to commercial feed and seed are weak. Data on livestock and poultry purchases are also weak, given problems identified with these estimates (i.e., the lack of good data to measure interprovincial movements).

Sales of secondary production are underestimated as it only includes the value of forest products sold. It is impossible to quantify this underestimation or its impact on the value of production, since there is no known source of information on the value of non-agricultural activities performed on farms, such as recreational activities and exploitation of gravel and sand pits.

The adjustments made to split farm land rental income between operator owners and non-operator landlords are based on the biennial Farm Financial Survey (FFS) information which is considered to be of good quality.

The adjustments made to split total wages into family and non-family wages, based on the Census of Agriculture, are considered to be of good quality.

Once revisions are made to the cash receipts and the expense series, they are then incorporated into the value added account. These revisions take place intercensally, after the results of the Census of Agriculture have been reviewed, and during non-intercensal periods, when more administrative data or larger Taxation Data Program (TDP)

survey samples are available. Please refer to the concepts and methods of these contributing series for more detail on the revision process in the publications **Farm Cash Receipts - Agriculture Economic Statistics**, Catalogue no. 21-011-X and **Farm Operating Expenses and Depreciation Charges - Agriculture Economic Statistics**, Catalogue no. 21-012-X.

Sources of value production

Sales of agricultural products to other farms represent the inter-farm sales of the following three items: livestock and poultry, feed, and seed.

Livestock and poultry inter-farm sales are based on TDP data. The TDP data represent total purchases on the part of producers. The data are adjusted by subtracting imports from other provinces and from outside Canada.

Inter-farm sales of feed are derived by subtracting estimates of commercial feed (expense series) from total feed expenses.

Inter-farm sales of seed are derived by subtracting estimates of commercial seed (expense series) from total seed expenses.

Sales of agricultural products to other sectors represent total crop and livestock receipts, excluding cash receipts from sales of forest products (cash receipts series).

Sales of secondary production currently include only sales of forest products (cash receipts series).

TDP estimates are used to measure **custom work receipts**.

Program payments data are based on estimates from the cash receipts series.

Government rebates data are based on estimates of rebates reducing expenses from the expense series.

Farm land rent represents total rental income to operators for the rental of agriculture land and buildings. It is based on the expense series estimates for cash rent and adjusted to exclude rent paid to non-operators, using survey data related to the quantity of farmland rented to others. The survey data is obtained biennially from the FFS.

Income-in-kind data are based on estimates from the net farm income series.

The **value of inventory change** represents the value of the physical change in inventories as calculated for net income purposes.

Total value of production is the sum of all sources of income.

Allocation of value of production

Expenses on inputs from other farms (purchases) combine the estimated sales of agricultural products to other farms with the farm land rent.

Expenses on inputs from other sectors, based on the farm operating expense series (gross of rebates), include: building and fence repairs, electricity, telephone and other telecommunication, heating fuel, machinery fuel and repairs, fertilizer and lime, pesticides, commercial seed, irrigation, twine, wire and containers, crop and hail insurance, commercial feed; livestock and poultry purchases, artificial insemination and veterinary fees, business insurance premiums, stabilization premiums, legal and accounting fees, and all other expenses. Also included is gross custom work expense based on TDP estimates.

Business taxes currently include only property tax estimates from the expense series.

Gross value added is derived by subtracting expenses on inputs and business taxes from the total value of production.

Depreciation data are based on estimates from the expense series.

Net value added is calculated by subtracting depreciation from gross value added.

Distribution of net value added

Rent to non-operators is calculated by applying a ratio obtained from FFS data to the sum of cash and share rent estimates (expense series).

Interest data are based on estimates from the expense series.

Non-family wages are calculated by deducting family wages (see below) from total wages (expense series). Non-family wages for incorporated agricultural businesses include room and board.

Family wages are allocated to **incorporated farms** and **unincorporated farms**. Ratios to break down family wages between these two types of agricultural businesses are obtained from the Census of Agriculture data and are applied to total wages (expense series). As of 1993, colonies and institutions are included with corporations.

The residual of net value added, **corporation profits** and **unincorporated operator returns**, is allocated to these two components individually by applying annually updated ratios from TDP for these two types of farm businesses.

Users are cautioned to note that, prior to 1991, a different methodology was used to distribute net value added and that, consequently, a break in the historical series exists between 1990 and 1991.

Note to users

Since 1995, the Farm Financial Survey includes farms with gross operating revenues equal to or over \$10,000. Prior to 1995, farms with gross operating revenues equal to or over \$2,000 were included in the sample.
